The construction of large national enterprises and industrial systems in the economy made it possible to reduce the number of management objects and increase the efficiency of state regulation but made the structure of the Russian economy inflexible and noncompetitive.

At present, rapid development of information technologies mitigates restrictions on the processing of information for management decision-making, which creates additional opportunities for increasing the efficiency of government regulation of the economy.

The third challenge for the government regulation of the economy is the problem of choosing priorities for the regulatory impact. State is often faced with a dilemma of selecting relevant goals, both in terms of content (fighting inflation or maintaining employment, social justice or economic efficiency) and in terms of the time horizon (short-term and long-term goals), as well as the correspondence between the goals and the means to achieve them.

In contrast with the first two theoretical problems, the third one does not have one-size-fits-all solutions. It depends on the situation at hand and requires dynamism, variability, and flexibility of the government regulation of the economy.

Presently, main discussions regarding the theory of government regulation of the economy are focused on the search for effective tools, technologies, and mechanisms of state regulation and means of involvement of other economic entities (firms and households) in these processes. Moreover, the field has grown to include the analysis of best practices of state regulation in the world and the OECD recommendations on regulation. The achievements in the field of IT and social psychology are among the key factors that contribute to the step change in our capacity to design effective measures of government regulation of the economy (OECD 2018).

## Goals, Objectives, and Methods of Government Regulation of the Economy in Russia

The goals of government regulation of the economy in Russia can be divided into general, specific, and one-time goals.

General goals of regulation are fairly standard for all countries and include achieving sustainable economic growth and increasing welfare of the population. These goals are strategic and long term in nature (Federal law of the Russian Federation 2014).

Specific goals of government regulation of the economy are associated with national development priorities and systemic challenges facing the country. In this case, state regulation of the economy takes on tactical character. At present, specific goals of government regulation of the economy in Russia are determined by the Russian Federation President Decree No. 474 "On the National Development Goals of

the Russian Federation through 2030," dated July 21, 2020.

The Decree indicates five key goals:

a) Preservation of the population and the health and welfare of the people
b) Conditions for self-fulfillment and the unlocking of talent
c) Comfortable and safe environment
d) Decent and effective jobs and successful enterprise
e) Digital transformation

One-time goals of government regulation of the economy arise under conditions of unforeseen events or force majeure problems of vital nature. Basically, they are related to economic crises of a different nature (e.g., fighting the economic consequences of COVID-19). These problems determine operational actions of the state in the economy. It should be noted that such one-time goals (despite their importance and scale) from the position of government regulation of the national economy are only temporary and circumstantial and should not interfere with the achievement of general and specific regulation goals.

The objectives of government regulation of the economy are derived from its goals and are implemented in the operational activities of the regulation subjects (government bodies and other structures). A number of major objectives of state regulation are carried out through state functions, i.e., permanent and long term.

Depending on the method of influencing the object of regulation, the methods of government regulation of the economy are divided into direct (administrative and economic) and indirect.

Indirect methods (monetary regulation, tax regulation, currency regulation, etc.) change the environment for the functioning of economic agents, inducing them to independently change their course of action in the direction that is necessary for the regulator. This is considered to be a more effective approach in the long term than a direct method of influencing the controlled object.

However, with indirect methods, the regulatory effect is weaker and more postponed in time than with a direct effect. In addition, the indirect method of regulation requires developed transmission mechanisms in the economy, which may be underdeveloped in emerging markets. Therefore, in Russia, direct methods of government regulation are important and support the manageability of the economy under the conditions of underdeveloped and insufficiently effective market mechanisms.

## Institutions and Mechanisms of Government Regulation of the Economy

The Russian system of government regulation of the economy is complex and multilevel. The main subjects of government regulation of the economy are federal executive authorities, among which the Ministry of Economic Development of the Russian Federation takes the main role. The Ministry develops strategic planning documents for the national economy, assesses its current state, prepares economic development scenarios, and evaluates the effects of economic policy decisions. Among its goals is balanced spatial development of the country, which is ensured by a combination of sectoral and territorial development strategies. An important area of the Ministry's activities involves improving the quality of public administration and the process of providing public services.

The Ministry of Finance of the Russian Federation is responsible for the budgetary development, the state tax and customs-tariff policy, and the organization and supervision of the federal budget execution.

The Central Bank of the Russian Federation is a mega-regulator of the financial market and is responsible for the regulation and development of all its sectors: the banking system, the insurance sector, collective investments and pension savings, the securities market, and microfinance. It also develops and implements the government monetary policy and carries out currency regulation.

Another group of regulators includes ministries for the development of certain territories (e.g., the Ministry for the Development of the Russian Far East and Arctic), which are designed

to provide a systematic solution to problems related to the development of certain territories.

Sectoral ministries (e.g., the Ministry of Industry and Trade of the Russian Federation; the Ministry of Agriculture of the Russian Federation; the Ministry of Construction, Housing and Utilities of the Russian Federation; the Ministry of Transport of the Russian Federation; etc.) develop and implement strategies for the development and regulation of the relevant sectors of the national economy.

Development institutions function in close coordination with government bodies, and their primary objective is to ensure an uninterrupted investment and innovation cycle in the economy, eliminating market failures along the way. Development institutions in Russia are very diverse in form and function: corporations, foundations, centers, agencies, and joint-stock companies. Development institutions are expected to ensure the alignment of their activities with the priority goals of the country's development.

The state development corporation VEB.RF integrates the activities of most development institutions in Russia. It manages the Russian Export Center, the Federal Corporation for the Development of Small and Medium Enterprises, the RUSNANO Group (which implements the state policy for the development of the nanoindustry), the Industrial Development Fund, etc.

The state delegates some powers to regulate the economy to self-regulatory organizations, associations and unions of entrepreneurs, consumer societies, etc. Such elements of the network state tend to increase the effectiveness of regulatory influence of the state (Elstub and Escobar 2019).

Self-regulatory organizations develop, establish, and control rules and standards for business activities. As a result, market participants carry out regulatory and control functions in a certain area of the economy independently. For example, there are self-regulatory organizations of arbitration managers, appraisers, builders, auditors, etc.

Business associations and entrepreneurial unions exerting the greatest influence on the regulatory policy of the state are the Russian Union of Industrialists and Entrepreneurs (unites the largest Russian companies), "Business Russia" (represents the interests of mainly medium-sized businesses), and "Opora" (unites owners and managers of small- and medium-sized enterprises).

Another channel of the state influence on the economy involves the implementation of joint projects based on mutually beneficial cooperation between the state and business (public-private partnerships, concessions, etc.).

Various expert groups operating under government authorities, the Russian Academy of Sciences, universities, as well as independent centers for economic analysis and research also play an important role in the state regulation of the economy in Russia. The most famous of these are the Analytical Center for the Government of the Russian Federation, the Institute of Economic Forecasting of the Russian Academy of Sciences, research and expert centers under the Russian Presidential Academy of National Economy and Public Administration under the President of the Russian Federation, and the National Research University Higher School of Economics. They produce strategic and programmatic documents substantiating the goals, objectives, and mechanisms of government regulation of the economy and provide expert and analytical support for operational regulatory actions by the state.

## Modern Trends in Government Regulation of the Economy in Russia

The contemporary state of the system of government regulation of the economy in Russia is characterized by a wide range of challenges related to achieving national development goals, changing the economic growth model in Russia, tackling digital challenges, and implementing new technologies. The strategic goals of the government include creating effective mechanisms for economic self-development, based on clear specification of property rights, and ensuring the interconnectedness and integrity of the national economy reproduction.

The most important strategic task of government regulation of the economy in Russia is changing the economic growth model from raw

export oriented to innovative and import substituting. The decline in the world energy prices facilitates the accomplishment of this task to a certain extent. This situation contributes to the investment flow into non-resource sectors of the economy. Various import substitution measures have been implemented in Russia since 2015, which contributes to the restoration of the internal technological chains and the creation of an integrated production process, which remains open and closely connected to international markets.

The activities of specialized development institutions, the implementation of federal state programs, tax preferences for innovative enterprises – these are but a few measures aimed at creating the innovative economy and activating new factors of economic growth in Russia (Ivleva 2013).

The digital transformation of the economy has created new challenges for government regulation as well as new opportunities and tools for regulatory impact. The increase in the number of economic entities; the development of the sharing economy; the emergence of new types of business (including online), new assets (Bitcoin), and new channels of interaction between consumers and producers; and the growing uncertainty and unpredictability of economic development require greater state flexibility, adaptability, and ability to respond quickly to emerging economic problems (Mensah 2020).

The nature of government regulation of the economy is changing. The state acquires features of a digital platform, develops electronic services, and organizes direct interaction between the state and citizens. There emerge elements of an "internal state" – programs of accounting and control integrated into the current economic activity of economic entities. These elements make it possible to radically change the nature of state control activities and the information basis of government regulation of the economy by means of providing relevant economic information in real time. The use of big data and artificial intelligence in government regulation of the economy makes it possible to objectively assess the situation, to promptly and proactively respond to emerging problems, and to reduce limitations of effective information processing by the control system (Shklyaruk 2019).

At the same time, the role of an individual in government regulation of the economy is growing. Sociocultural institutions of regulation and constructive interaction and partnership of the state, business, and citizens in solving economic problems become increasingly important.

## Conclusion

Government regulation of the economy in Russia is of decisive importance for the direction and coordination of economic processes in the country. The planned management experience in the Soviet period, a deep theoretical understanding of the regulation mechanisms and self-regulation in the economy, and the market reform practice in the 1990s made it possible to form a developed and diverse system of national economy regulation. Development institutions, self-regulatory organizations, associations and unions of entrepreneurs, civil society institutions, and the expert community play an important role in this system along with the authorities.

The most important challenges for the government regulation of the economy in modern Russia are the implementation of national development goals, the transition to a new economic growth model, the maintenance of the market mechanism efficiency, and the support of self-development processes in the economy.

The main directions of improving the government regulation of the economy in Russia are associated with the increase in the effectiveness of regulatory mechanisms; the formation of a "state platform," an "internal state"; the transition to public administration in real time; and the development of network forms of regulatory impact.

# Russia, Labor Migration Processes

Alexander Kotchegura
The Russian Academy of National Economy and Public Administration (RANEPA),
Moscow, Russia

## Synonyms

Economic migration; Immigration of workers; Migration for employment

## Definition

International labor migration is a relocation of persons from a home country to another country with the purpose of employment.

## Introduction

International labor migration is increasingly viewed as a high-priority issue by many governments, politicians, expert community, and the broader public throughout the world. This is explained by many factors, in particular, by the deficit of labor force in certain areas of the economy in many countries, by the impact of labor migration on the economy of developing states, by the strategies to attract "world-class talents" adopted by many governments, and by the problems associated with large-scale relocation of persons, e.g., illegal migration, criminality, unfair treatment of migrants by employers, cohabitation and integration of migrants with the host society, etc.

Labor migrants account for nearly two-thirds of the total number of international migrants which is estimated to be around 272 million globally (UN DESA 2019). The international labor migration is subject to the influence of economic, political, demographic, geographic, historical, and other factors, which result in the emergence of migration "corridors" as a rule developed over many years. The "corridors" with the most intensive "traffic" tend to exist from developing countries to the largest economies such as United States, Germany, France, the Russian Federation, and Saudi Arabia.

Since the early 1990s, the Russian Federation has been the largest receiving, sending, and transit country for migrant workers and professionals in Eastern Europe and Central Asia. International labor migration in Russia comprises the inflow of immigrants from other countries mainly from the former Soviet Union republics and an outflow of emigrants into economically more developed countries, such as the United States, Germany, and Israel.

The purpose of this entry is to provide a concise overview of the characteristics and trends of international inflow of labor migration to the Russian Federation following the breakdown of the Soviet Union.

## Historical Background

Since the early 2000s, Russia has become one of the largest in the world centers of attraction for labor migrants, the absolute majority of which come from the successor states of the Soviet Union, currently members of the Commonwealth of Independent States (CIS countries). According to the estimates of the UN Population Division, as of 2019 the Russian Federation was the fourth country in the world in terms of numbers of immigrants next to the United States, Germany, and Saudi Arabia.

Historically, the phenomenon of cross-border labor migration – i.e., movement of persons away from their place of usual residence and across an international border to a country of which they are not nationals with the purpose of getting employment – can be traced to the times of the tsarist Russia. The Russian government was one of the first in the world to establish in 1763 a specialized State Department of Migration Management. The main function of this institution was to promote migration from Western European countries to Russia. As a result of this policy, thousands of immigrants, mainly skilled professionals, e.g., professors, military experts, engineers, architects, and businessmen, settled in Russia. Ethnic Germans made up the largest share of migrants at that time. Available data demonstrate that there were about 1.8 million Germans in the Russian Empire by the end of the nineteenth century (Nozhenko 2010).

During the times of the Soviet Union interstate, labor migration was accomplished on a limited scale in line with special agreements signed by the governments of the Soviet Union and other socialist countries. In the 1970s and 1980s, tens of thousands of workers mainly from Bulgaria, North Korea, and Vietnam migrated annually to major Soviet cities and the remote areas of Russia. In 1981, the Soviet Union and Vietnam signed an employment and professional training agreement, which provided for the temporary relocation of 100,000 Vietnamese to different Soviet republics over the course of a decade.

The breakup of the Soviet Union in 1991 and prevailing at that time uncertainty in the economic, political, and other areas of social life did not favor the expansion of labor migration to Russia. The Russian government adopted the first measures to regulate flows of labor migration in 1994, when 108,000 work permits were first issued to foreigners. From 1995 to 2000, the annual number of work permits fluctuated between 106,000 and 186,000. One-third of migrant workers came from Ukraine and more than half from countries outside the former Soviet Union, mainly China, Turkey, and former Yugoslavia. The number of workers from Central Asian states was insignificant until the late 1990s, as was the number from the countries of Transcaucasia.

In the early 1990s, the legal status of foreign citizens was still largely regulated by Soviet laws that were no longer compatible with the rapidly changing reality. Comprehensive rules on residence and work for foreigners in Russia were lacking, and procedures for issuing residence permits were obsolete. To improve the situation, the Russian government gradually introduced a set of commonly used migration management tools and procedures, including visas to attract foreign employees, work permits, registration of place of stay for foreigners, and permits for permanent and temporary residence.

Since the start of the 2000s, economic factors strongly influenced the direction and scale of migration flows in the post-Soviet territories. Stable economic growth in Russia created a high demand for labor. The widening income gap and differences in the living standards between Russia and other CIS countries created conditions for the influx of temporary immigrant workers, in particular from the new Central Asian states.

Workers from China, North Korea, and Vietnam also started to come to Russia in more or less significant numbers. However, these countries did not substantially change the general composition of migration flows. The post-Soviet countries in Central Asia have remained the largest suppliers of the workforce to Russia.

## The Key Characteristics of Labor Migration to Russia

Migrants working in Russia come from more than 100 countries worldwide. However since the early 2000s, the flow from "near-abroad" CIS countries, mainly Uzbekistan, Tajikistan, and Kyrgyzstan, has been dominant and growing, while the share of main "far-abroad" suppliers (China, Turkey, and Vietnam) is declining.

Over the period 2000–2020, foreign workers have become an integral part of the Russian labor market. By 2013 the number of temporary foreign workers in Russia reached 7 million people, of which 3 to 4 million were undocumented migrants (Denisenko 2017).

The statistical data from the Russian Federal Border Service indicate that a total of 3.8 million citizens of post-Soviet states entered Russia as labor migrants in 2019, of whom almost 1.5 million came from Uzbekistan, 875,000 from Tajikistan, and 558,000 from Kyrgyzstan.

As stated by the main directorate for migration of the Ministry of Internal Affairs in 2019, 5.5 million foreigners got registered in Russia for the purpose of employment as immigrants. More than 90% of them came from the CIS countries, and more than 60% of immigrants were registered in Moscow and the Moscow Region as well as in St. Petersburg and the Leningrad Region. Because of the pandemic, the number of foreigners registered as workers in April–June 2020 declined by 1.3 million compared to that of the same period of 2019 (Denisenko and Mukomel 2020).

According to various sources, the overall number of foreign labor migrants in Russia in 2019 (including illegal and those who came in previous years) reached 10 million persons. These data generally coincide with the estimates of the World Bank, which assessed the number of international labor migrants in the Russian Federation (including unregistered) to be about 9–10 million people (World Bank 2017).

Contrary to the experience of many countries in postwar Europe that developed targeted policies of stimulating the inflow of labor migration, mass arrival of migrants to Russia started rather spontaneously, triggered off by asymmetries in economic development, level of average income, and visa-free mobility across the Commonwealth of Independent States.

The causes of large-scale migration flows are rooted in the hard economic situation and high rate of unemployment in the majority of Central Asian countries. Labor migration is of crucial importance to many "sending" countries. It alleviates pressure on the labor markets of the countries where the number of youth is growing rapidly (Kyrgyzstan, Uzbekistan, Tajikistan) or where the labor market is "shrinking" (Armenia, Moldova, Ukraine). For example, in 2019, 47% of Tajikistan's entire workforce participated in international labor migration.

Russia is attractive for migrants from the CIS countries because of available job opportunities, historical and cultural proximity, language, large diasporas, level of income, and visa-free regime.

Incoming international labor migration in the Russian Federation is characterized by a large proportion of undocumented migrants and a predominance of low-skilled workers. Unlike the situation in the late 1990s and early 2000s, at present the majority of young labor migrants have very weak knowledge of the Russian language as well as of the Russian laws, rules, and culture.

The migration from Central Asia to Russia is predominantly male. Over 80% of the migrants from Central Asia are males from 20 to 50 years old. They are mostly seasonal migrants. They go to Russia for 10–11 months a year, and then they go back to their home country for 1 or 2 months. This is the only time when they get to see their wives, children, and other relatives.

Many of these migrants are filling a niche in the national labor market by doing jobs that host country citizens are not interested in taking up. According to official data, migrants make up 40% of construction workers, 19% of workers in the trade sector, and 7% in agriculture and food production in Russia.

Remittances sent by migrants back home have become a survival strategy and a financial safety net for their families. Moreover, migrant remittances, coming mainly from Russia, make up a substantial share of GDP of a number of post-Soviet countries, in particular in 2017: 37.4% of Kyrgyzstan's GDP; 28.9% of Tajikistan's GDP; and 21.6% of Moldova's GDP.

The remittance inflows contribute to the reduction of poverty and constitute an important source of financing certain sectors of the economy and a major source of foreign currency supply, exceeding foreign direct investments in the economy of these countries.

## The Government Policy Towards Labor Migration in Russia

Management of labor migration processes remains one of the priorities of the Russian government's both domestic and international policy.

Russia needs labor migrants to compensate for the decline in the working-age population. The country's labor force is shrinking rapidly. During the period 2007–2019, Russia's working-age population (defined as 16–55 years for women and 16–60 years for men) has been diminished by almost 10 million people. Taking into account current demographic trends by the year 2040, the labor force in Russia will have shrunk by 15 million people.

By attracting more workers in the areas of construction and skilled workers in large and small enterprises and machine building, the Russian authorities also aim to reduce the spatial disparities and mitigate the uneven density of population especially in the Far East and Siberia. According to the estimates of the Russian Ministry of Labour and Social Protection, the country will need between 800,000 and 1.5 million migrant workers annually to compensate for its shrinking labor force and maintain economic growth.

During the initial period of formation of the new Russian state in the early 1990s, migration management was not backed up by a comprehensive legal framework and lacked a clear-cut strategy. Between 1998 and 2000, 1.5 million migrants resided in Russia illegally. In an effort to reduce illegal immigration and set up a proper legislative basis for an adequate regulation of migration flows, the Duma adopted two Federal Laws "On the Legal Status of Foreign Citizens" (2002) and "On Migration Registration of Foreign Citizens and Stateless Persons in the Russian Federation" (2006).

The government simplified the procedures for obtaining work permits and registration of temporary residence for migrants from the former Soviet republics. Starting from 2006, citizens of countries with visa-free entry could apply for a permit without a sponsoring employer, while nationals of other states required an employer invitation. Simultaneously quotas for foreign workers have been raised considerably. These and other measures marked liberalization of the Russian government's migration policy (Malakhov 2010).

In 2010, the Russian authorities introduced two new ways to access the labor market: a "patent" system for citizens of former Soviet republics with visa-free entry and simplified rules for the recruitment of highly qualified specialists. The system of patents was targeting mainly migrants from the CIS hired by individuals or families to work in their households. The idea was that those employed by companies or enterprises pay taxes, while those who work in households as nannies, drivers, caretakers, etc. do not; therefore they should pay a special tax upfront.

In June 2012, the president of Russia signed the State Migration Policy Concept of the Russian Federation. The concept outlined the task to facilitate "adaptation and integration of migrants, formation of constructive interaction between the migrants and host society" based on the differential approach to various categories of migrants. The document aimed to make immigration policy more balanced and proactive. The implementation of the concept necessitated the introduction of over 50 legislative changes in the laws on the legal status of foreign citizens, citizenship, entry and exit procedures, etc.

In parallel Russia confirmed its commitment to numerous international agreements in the area of labor migration, both bilateral and collective. In particular, the Russian Federation signed the UN Convention against Transnational Organized Crime and two "Palermo Protocols" against Trafficking in Persons and against Smuggling of Migrants and made a number of respective amendments to the Russian Criminal Code (Voinikov 2013).

On 31 October 2018, Russian President Vladimir Putin signed a decree approving a new "Concept of the State Migration Policy of the Russian Federation for the period 2019–2025." The concept singled out existing problems and

"bottlenecks" in the area of labor migration, namely, prevalence of informal practices of job-seeking and employment; unregistered (illegal) employment of migrants; uneven distribution of migrants across the country; increased burden on the capacities of cities and regions to accommodate migrants; increased risks of dangerous epidemics and criminality; weak control over the implementation of migrants' work contracts; violation of migrants' rights; corruption in the field of migration management; social isolation (self-isolation) of migrants; and ethnic-based tension in the areas of high concentration of migrants.

A strategy of addressing the abovementioned issues was elaborated, which provided in particular for setting up migrants' adaptation centers across the country; encouraging and supporting NGOs to work with migrants; tougher penalties for the organization of illegal migration; introduction of the Russian language, legislation, and history tests for newly arrived migrants; and allocation of additional funding to the local authorities dealing directly with the labor migrants.

In spite of existing problems common to many countries, which deal with large-scale labor migration, there are also positive trends in the examined area. For example, the findings of a recent survey generally confirm that the ethnic second-generation migrants from Transcaucasia and Central Asia are on average: (1) equally advanced compared to the locals in terms of the level of education and income; (2) have ethnically mixed social ties but stick to the monoethnic marriages; and (3) their ethnic self-identification does not conflict with the Russian one as well as with the statement that Russia is their home.

## Conclusion

Notable differences in living standards, prevailing demographic trends, and situations on national labor markets of the post-Soviet states as well as visa-free regime within the Commonwealth of Independent States create incentives for large-scale labor migration to the Russian Federation.

International labor migration has become an important factor of the domestic and foreign policy of the Russian Federation and the CIS countries – suppliers of labor force to the former "parent state." It proved to be equally beneficial for both the "sending" and "receiving" countries.

Labor emigration plays a significant role by contributing to the reduction of poverty and by supporting economic development especially in those countries where migrant remittances from Russia constitute a significant amount relative to GDP.

At the same time, international labor migration allowed Russia to compensate for almost 60% of the natural population loss experienced following the collapse of the Soviet Union.

In spite of a number of problems in this area, common to many countries, which accept labor migrants, overall the balance is positive. For example, recent studies of the situation with second-generation migrants from Transcaucasia and Central Asia (who settled permanently in Russia) demonstrate that the absolute majority of children of the first-generation migrants are equally advanced relative to the young Russians in terms of level of education and income and their ethnic self-identification does not conflict with the statement that Russia is their home.

The perspectives for incoming labor migration in the Russian Federation largely depend on the continuation of economic crisis (to a considerable extent linked to pandemic) and the rate of economic growth in Russia and on the advance of practical realization of current strategies geared to address labor migration issues. Successful implementation of the recently approved concept of the state migration policy of the Russian Federation till 2025 could facilitate the arrival and employment of different categories of law-abiding labor migrants and create the basis for adaptation and integration of those migrants who would like to settle permanently in the country.

# Russia, Legal Regulation of Civil Service

Igor Bartsits
Institute of Public Administration and Civil Service of the Russian Presidential Academy of National Economy and Public Administration, (IPACS RANEPA), Moscow, Russian Federation

## Synonyms

Civil Service Laws; Legal Basis of Public Administration

## Definition

Legal regulation of civil service in Russia is a system of normative legal acts that describe the activities of civil servants in the Russian Federation in performing the functions of state bodies and providing public services. As a rule, the legal norms that form the institution of civil service are divided into two types: legal norms governing the relationship between civil servants and state bodies, which regulate the process of civil service for officials; and legal norms governing the relationship between civil servants and other persons.

## Introduction

As a professional activity of citizens aimed at fulfilling the powers of state authorities, Russian civil service includes several components that form types of civil service. The main criterion for dividing the federal civil service into types is the subject of activity; that is, the duties federal civil servants need to fulfill every day. In the Russian Federation, the unified civil service system includes the state civil service, military service, and some other types.

A distinctive feature of the legal regulation of civil service relations is that this institution is complex and includes the norms of various branches of law: constitutional, international, administrative, labor, and financial. In addition, the legal regulation for civil service is carried out at two levels – federal and regional level of the territory of the constituent entities of the Russian Federation; the regulation has many legal forms, starting with the Constitution of the Russian Federation and ending with different regulatory legal acts of local state authorities. In these conditions, approaches and principles for regulating the state civil service relations must ensure the systemic approach and unity of the relevant legislation, its harmony and consistency, as well as eliminate differences and contradictions in regulatory legal acts at various levels.

The legal basis for the construction and functioning of the civil service system in the Russian Federation are federalism, legality, the priority of human and civil rights and freedoms, equal access to entering the civil service, the unity of the legal and organizational foundations of civil service, the interconnection between state civil service

and municipal service, transparency and accessibility of civil service to public control, professionalism and competence of civil servants, protection of civil servants from unlawful interference in their professional duties (Bartsits et al. 2018).

## The System for Civil Service Legislation in the Russian Federation

The formation of legislation on civil service goes along with the development of Russian legislation and taking into account the continuity of the general concept for improving the civil service at all stages of the formation of the regulatory framework in this area (to date, the decree of the President of the Russian Federation No. 2267 of December 22, 1993, which approved the Regulations on the Federal civil service, Federal law No. 119-FZ of July 31, 1995 "On state civil service in the Russian Federation", etc. have become invalid).

Currently, legal support of Russian civil service is provided by an extensive legal framework, namely: the Constitution of the Russian Federation (part 4 of article 32, paragraph "t" of article 71, part 3 of article 97) and the Federal Laws No. 58-FZ of May 27, 2003 "On the system of the state civil service of the Russian Federation"; No. 79-FZ of July 27, 2004 "On state civil service of the Russian Federation"; No. 25-FZ of March 2, 2007 "On municipal service in the Russian Federation", and other Federal laws; decrees of the President of the Russian Federation; resolutions of the Government of the Russian Federation; normative legal acts of Federal Executive bodies; constitutions (charters), laws, and other normative legal acts of the constituent entities of the Russian Federation; normative legal acts of state bodies.

According to art. 15 of the Constitution of the Russian Federation, commonly recognized principles and norms of international law, as well as international treaties of the Russian Federation are part of the Russian legal system; the analysis of the system governing public-state relations should begin with a study of the basic principles of international law. The concept on reforming the Russian civil service system contains a provision where the legal regulation of the state civil service system is carried out "in accordance with commonly recognized principles and norms of international law, international treaties of the Russian Federation." The study of international legal documents showed that Russia ratified a significant number of international legal acts concerning the status of a civil servant, the procedure for working in the civil service, etc. When creating the regulatory-legal framework of the federal civil service, it is necessary to take into account the obligations of the state under international law and avoid contradictions in acts that are being adopted.

The Universal Declaration of Human Rights, which proclaimed the right of every person to equal access to civil service in their country, should be mentioned as one of the international legal documents that is a legal source in the organization of state civil service. The constitutional right to work was considered to include the right to enter state civil service.

Of great importance for the legal regulation of the state civil service are the following legal documents: art. 3 of the Convention on the Political Rights of Women of March 31, 1953, according to which women, on equal terms with men, have the right to hold positions in the public and civil service and perform all public and civil functions established by national law; the International Covenant on Civil and Political Rights of December 16, 1966 (ratified by the USSR in 1973), enshrines the right of every citizen, without any discrimination, to be admitted to state civil service (article 25); UN General Assembly Resolution 34/169 of December 17, 1979 – "Code of conduct for law enforcement officials"; Resolution of the CIS Interparliamentary Assembly of June 15, 1998 No. 11–5 "On the model law," "On the fundamentals of civil service basics." According to the international law of every democratic country, the state's obligation to its citizens constitute substantive rights and obligations of civil servants to civil society, thus, determine the structure of functions of state civil service to the people for maintaining its state (public) affairs.

The system of Russian legislation on civil service includes Federal normative legal acts and legal acts of the constituent entities of the Russian Federation, which form a single hierarchical system based on the legal force of legal sources.

1. *The Constitution of the Russian Federation*

   Constitutional law plays an essentially important role in the legal regulation of the federal civil service. Firstly, the norms of constitutional law that establish the principles of the political structure of the state, the system of government bodies, the jurisdiction and powers of the Federation and its constituent entities, etc., determine the initial parameters for the formation and functioning of the federal civil service. Secondly, the norms of constitutional law governing public relations in the implementation of civil service and the process of its implementation are the subject of the activities of the federal civil service.

   In the Constitution of the Russian Federation, the category "civil service" is mentioned three times: paragraph 4 of art. 32 states that "citizens of the Russian Federation have equal access to civil service," in paragraph "t" of art. 71, according to which "Federal civil service" is under the jurisdiction of the Russian Federation; paragraph 3 of art. 97, states that "the deputies of the State Duma cannot participate in the civil service." The Constitution of the Russian Federation and its provisions related to the state civil service (paragraph 4 of art. 32, paragraph "t" of art. 71 of the Constitution of the Russian Federation) are having the supreme legal force, operate and applied throughout Russia, form the basis for legislation on the state civil service. They correspond to requirements of paragraph 1 of art. 15 of the Constitution of the Russian Federation, which prohibits the publication of laws and other legal acts that contradict constitutional norms. Additionally, the constitutional regulation of public relations sets limits beyond which any normative legal act adopted on the territory of the Russian Federation cannot go.

   In addition to the principle of the supremacy of the Constitution of the Russian Federation and federal laws over other regulatory legal acts and job descriptions, it is necessary to mention the principle of the priority of human and civil rights and freedoms, the right of citizens to enter the civil service, and others, well-known and described in the legal literature principles, arising from the implementation of state civil servant's duties and ensuring their rights. The establishment of the institution of federal civil service (paragraph "t" of art. 71) obliges the legislator: firstly, to regulate this institution by law, and secondly, to ensure control and management of the state civil service as a fully independent subject under the jurisdiction of the Russian Federation.

2. *Federal laws*

   (a) *Federal Law No. 58-FZ of May 27, 2003 "On the system of the civil service of the Russian Federation"* determines the legal and organizational basis for the civil service system of the Russian Federation, including the management system for the civil service of the Russian Federation. This law establishes the type classification of the civil service, the organizational and legal separation of the state civil, military, and other types of service.

   Articles of this document establish: positions in the state civil service (positions of the federal state civil service) (art. 8); registers of positions (art. 9); registers of civil servants (art. 15); the legal status of a federal civil servant (paragraph 4 of art. 10); the formation of the civil service personnel (art. 11); admission to the state civil service, its duration and termination (art. 12); class ranks, diplomatic ranks, military and special ranks (art. 13); seniority (total duration) of civil service. Personal data of state civil servants (art. 14); governing the state civil service (art. 16); personnel reserve for filling civil service positions (art. 17); financing of the state civil service, as well as programs for its reform and development (art. 18). In fact, the Federal Law "On the system of the civil service of the Russian Federation" has general

nature and is statewide. It establishes common principles and basic provisions for the legal regulation of the state civil service and eliminates serious contradictions in the legislation that have arisen in recent years. This document is the basis for the adoption of "specific" Federal laws on civil service, including on the state civil service and on the state civil service of the constituent entities of the Russian Federation.

The Federal Law "On the system of the civil service of the Russian Federation" identifies, legally describes, and logically defines the main subinstitutions of the state civil service: the classification of positions, the procedure for the employment, certification, retraining and personnel reserve of civil servants, and their legal status and other provisions traditional for modern civil service.

(b) *Federal Law No. 79-FZ of July 27, 2004 "On the state civil service of the Russian Federation"* regulates issues of state civil service as one of the types of state service of the Russian Federation.

The law mentions topical legal problems in reforming the civil service, defines its principles, the legal status of a federal civil servant and a state civil servant of a constituent entity of the Russian Federation, presents the classification of positions and qualification requirements for state civil service positions, describes the procedure for entering the state civil service and the work process, including working conditions, shows the mechanism for resolving conflicts of interest in the state civil service, as well as some other issues related to the state civil service.

Many provisions of the Federal Law of July 27, 2004 No. 79-FZ were introduced for the first time, in particular:

- The state civil service is carried out not in a separate state body but is a kind of state service to ensure the powers of the Russian Federation or a constituent entity of the Russian Federation. At the same time, the powers of the employer acting on behalf of the Russian Federation or a constituent entity of the Russian Federation are exercised by the heads of state bodies, persons holding public positions, or their representatives.
- The establishment of four categories of positions in the state civil service –managers, assistants (advisers), specialists, and supporting specialists, makes it possible to develop requirements, clarify job responsibilities, the level of remuneration, and social guarantees.
- The application of competitive selection procedures for admission to the state civil service.
- The main form of agreement for recruitment is a service contract (signed for an indefinite period (unlimited) or fixed-term); as a rule, fixed-term service contracts are provided for managers, their deputies, and assistants (advisers).
- In order to increase responsibility among civil servants, as well as to raise efficiency in the performance of official duties, an official regulation was introduced; it regulates performance and includes qualification requirements, a list of issues when a civil servant has the right to make decisions independently, a list of public services provided to citizens and organizations, performance indicators, etc.
- To determine the qualification of the state civil servant, a mandatory attestation was introduced; the certification commission must include independent experts of at least one-quarter of the total number of commission members.
- The introduction of class ranks; as a rule, the assignment of a rank is carried out individually after the examination. The President of the Russian Federation can assign only the class ranks of the actual state adviser of the Russian Federation of the 1st, 2nd, and 3rd classes.

- The special mechanism was proposed for resolving conflicts of state and personal interests in the civil service, including the formation of commissions with the participation of independent experts.
- Determination of the procedure for informing the public about the work of the state civil service through the use of information resources, internet technologies, and other types of electronic infrastructure.
- It is stated that it is necessary to establish a unified procedure for the formation of a personnel reserve consisting of the most promising employees for better functioning of the state civil service; this is achieved through professional and advanced training in order to fill senior and mid-level positions by appropriate candidates, as well as to promptly resolve the issues of appointment to vacant positions.
- To prevent corruption, it is mandatory to provide information about income, property, expenses, and property obligations of the civil servants, as well as income, property, and property obligations of their family members to the personnel service; after dismissal from the civil service, restrictions are introduced for a certain period of time to hold positions in organizations, if they were in some way connected with the direct official duties of the state civil service employee;
- Taking into account the effectiveness of the actions of the state body, the procedure for compensating for the official duties of civil servants is being carried out, as well as a set of material and moral incentives and awards for impeccable and effective service.
- To attract highly qualified specialists from among graduates of higher and secondary specialized educational institutions to the civil service, there is a possibility to carry out a specific agreement between the employer's representative, the educational institution, and the student so that the latter undergoes special training and in the future, such a graduate will be obliged to enter the state civil service for a specified period of time.
- The grounds for sending a civil servant for professional retraining and advanced training were established. It is assumed that the progress of state civil servants in the field of additional education will directly affect their career growth, which, in turn, should increase their motivation to undergo training. A unified procedure for planning and placing state orders for additional education of civil servants is being introduced for state bodies.

Amendments to the law establish that when signing a service contract with a citizen entering the state civil service for the first time, there is a probationary period of up to one year to verify his/her compliance with the state civil service position. Additionally, to increase the professionalism and competence of civil servants, the effectiveness of the selection of personnel and the professional development of state civil servants, qualification requirements for entering the state civil service positions have been introduced, taking into account the field and types of activities of civil servants (the Handbook of qualification requirements for applicants filling the positions of state civil servants and actual state civil servants).

The official (service) regulation of a state civil servant should be especially noted. It is the main legal act regulating the official activities of a state civil servant, including his/her official and service rights, duties, and responsibilities. Using this regulation, each employee knows the cleared list of decisions he/she can make independently, the terms of consideration, and the procedure for their adoption. Thus the official regulation includes the

functions, tasks and powers of a state civil servant, regulates the procedures of interaction between a state body and a citizen, the participation of applicants in decision-making, determines the civil servants' area of responsibility, and contains information on mechanisms and procedures for resolving disputes and conflicts (The term "official" is presented in the legislation of many countries of the world; however, it is not used in modern Russian law. In the mass media, this term is broadly used to refer to any government representative. In most cases, it has a negative connotation. Experts prefer to designate as "officials" exclusively state civil servants.).

As a result after adopting the law, the implementation of the fundamental Concept on reforming the state civil service system of the Russian Federation was initiated; its meaning lies in the public-legal nature of the civil service, its definition as an institution designed to ensure the regulation of relations between citizens and state bodies, and not only the execution of the state's powers (Borshchevsky 2016).

At the same time, this Concept contains the potential for building open and democratic civil service; however, it is not fully implemented in the current legislation, and this makes it necessary to continue reforming the civil service.

(c) *Other federal laws, including those that regulate the financing of the state civil service* (for example, budget and tax legislation), the procedure for professional education (legislation on education, on higher and postgraduate education, etc.), property legal relations in the state civil service (civil legislation), the legal responsibility of state civil servants (administrative and criminal legislation), etc.

Studying the components of the legal basis of the state civil service, it is also important to consider the legislation governing the military and civil service of other types. This is necessary not only because all types of service are included in the unified system of the civil service of the Russian Federation but also because modern legislation proceeds from the unity of all legal and organizational foundations of the civil service, which implies a unified approach to the organization of the civil service. Because of this, the state civil servant has the opportunity to change one type of service to another.

Currently, the Military Service is regulated by the Federal Law "On conscription and military service." Citizens in military service are military personnel and have a special status established in the Federal Law "On the status of military servicemen." The unified federal law on other types of civil service, provided for by Federal Law No. 58, has not yet been adopted, therefore it is recommended to pay attention to the current laws that regulate the procedure for performing service in other types of civil service (for example, the Federal Law "On bailiffs," Federal Law "On the police," the Federal Law "On operational investigative activities," the Federal Law "On the prosecutor's office of the Russian Federation," etc.)

3. *The Decrees of the President of the Russian Federation*

Decrees, acts, and orders of the President of the Russian Federation play a significant role in regulating relations connected to the civil service. To implement federal laws, the President of the Russian Federation adopted the following decrees:

- No. 110 "On the attestation of state civil servants of the Russian Federation" of February 1, 2005;
- No. 111 "On the procedure for passing the qualification exam by state civil servants of the Russian Federation and assessing their knowledge, skills and abilities (professional level)" of February 1, 2005;
- No. 112 "On the competition for filling a vacant position in the state civil service of the Russian Federation" of February 1, 2005;

- No. 1474 "On additional professional education of state civil servants of the Russian Federation" of December 28, 2006;
- No. 557 "On the approval of the list of positions of the federal civil service, upon appointment to which citizens and upon replacement of which, federal civil servants are required to submit information about their income, property and property obligations, as well as information about income, property and property obligations of their spouse (wife or husband) and minor children" of May 18, 2009;
- No. 403 "On the main directions of development of the state civil service of the Russian Federation for 2016 – 2018" of August 11, 2016;
- No. 16 "On the qualification requirements for the duration of service in the state civil service or work experience in a specialty, the direction of training, which is necessary to fill positions in the federal state civil service" of January 16, 2017;
- No. 288 "On the main directions of development of the state civil service of the Russian Federation for 2019 – 2021" of June 24, 2019, etc.

As a rule, the decrees of the President of the Russian Federation contain norms and actions, which are meant to be implemented at the federal and regional levels of the civil service. Decrees of the President of the Russian Federation are issued in accordance with the provisions of the federal laws "On the system of state service of the Russian Federation" and "On the state civil service of the Russian Federation."

*Acts of the Government of the Russian Federation* are included in the legal and organizational framework for applying the laws on state civil service and decrees of the President of the Russian Federation regarding the issues of state civil service. In fact, these are acts of the daily management of the civil service. The adoption of a series of decrees and orders of the Government of the Russian Federation are normatively enshrined in the provisions of federal laws. For example, art. 61 of chapter 13 of Federal Law No. 79 "Formation of the state civil service personnel" describes the need to adopt regulatory legal acts that provide training, retraining, advanced training, and internship for civil servants. Additional professional education for federal civil servants, its volume and structure, is approved by the Government of the Russian Federation after the adoption of the federal law on the state budget for the corresponding year (paragraph 4 of art. 63).

A large group of normative legal acts on the state civil service is made up of acts of federal government bodies that regulate the characteristics of the working process in the state civil service.

Additionally, the legal acts regulating the organization of the state civil service include the acts of the Supreme Court of the Russian Federation, decisions of the Constitutional Court of the Russian Federation, and other judicial bodies.

In the regulation of the state civil service of the constituent entities of the Russian Federation, along with acts of international law and federal legislation, a significant role is also assigned to the normative legal acts of the constituent entities of the Russian Federation. During the development and adoption (publication), the state authorities of the constituent entities of the Russian Federation must proceed from the basic principles of the civil service established by paragraph 2 of art. 4 of the Federal Law No. 79, which allows for the unity of the legal and organizational foundations of the federal civil service and the civil service of the constituent entities of the Russian Federation.

The structure of laws on the state civil service of the constituent entities of the Russian Federation includes provisions common to all constituent entities of the Russian Federation: (1) basic concepts, as well as sources for regulation of the civil service; (2) the classification of civil service positions, qualification requirements for civil servants, the register of positions, class ranks, personal data and the formation of personnel; (3) the legal status of a civil servant, his/her basic rights, obligations, incentives, responsibilities, guarantees, the provision of information concerning income, property and liabilities of a property nature, salary; (4) the activities of the personnel

service of a state body and issues of maintaining personal data of a civil servant; (5) the issues of financing and development of the civil service.

An analysis of the laws of the constituent entities of the Russian Federation on the state civil service shows that, in some parts, they duplicate the provisions of the federal law. Thus such laws have weak regulatory power. Some constituent entities of the Russian Federation prefer to focus on regulating issues that are primarily within their competence (Bartsits et al. 2018).

Normative legal acts regulating specific issues of organizing the state civil service of the constituent entities of the Russian Federation include acts of legislative (representative) bodies, acts of senior officials, and executive bodies of the constituent entities of the Russian Federation. For example, the Decree of the Mayor of Moscow of November 7, 2008, No. 91-UM "On maintaining the Register of state civil servants of the city of Moscow"; the resolution of the Government of Moscow of February 22, 2012, No. 64-PP; the order of the Chief of Staff of the Mayor and the Government of Moscow of September 9, 2009, No. 25-DPR "On establishing the Commission under the Staff of the Mayor and the Government of Moscow on the classification of the automated system 'Personnel of the Moscow State Civil Service' containing personal data,", etc. Similar legal acts have been adopted in other constituent entities of the Russian Federation.

## Characteristics of Legal Support for Managing the State Civil Service of the Russian Federation

At the federal level, the issues of managing the state civil service fall within the competence of a number of state structures, which are formed by decisions of the President of the Russian Federation. They include the Commission under the President of the Russian Federation on the reform and development of the state civil service, approved by the Decree of the President of the Russian Federation of February 09, 2013, No. 126. The important role in managing the state civil service is held by the Department of the President of the Russian Federation for state civil service and personnel and the Department of state civil service and personnel of the Government of the Russian Federation.

Currently, in the Russian Federation, the initiatives for forming a unified management system within the entire system of state civil service are not being carried out. In the "Main directions of development of the state civil service of the Russian Federation" (2016), the Ministry of Labor and Social Protection of the Russian Federation was empowered to form the state policy and legal regulation of the civil service (Barabashev and Prokofiev 2015).

Experts say that at present, among the federal bodies, currently performing certain management functions of state civil service, one could name the Ministry of Finance of the Russian Federation, which is responsible for the remuneration of civil servants, and departmental quasi-bodies, which perform certain functions of managing the civil service; because according to some decrees of the President of the Russian Federation, the functions of managing the civil service body before its formation are performed by the federal state bodies (for example, the formation of commissions aimed at holding competitions for filling job vacancies, attestations, qualification exams) (Borshchevsky 2016).

At the level of the constituent entities of the Russian Federation, particular bodies for managing the civil service are created; they are endowed with their own powers. In some constituent entities, such bodies are created in the form of commissions (councils), in others they are created as structural subdivisions of government bodies. Quite often, such bodies are in charge of managing the civil and municipal services.

## Main Directions and Development Programs Aimed at Improving State and Municipal Services

The professionalism and competence of state civil servants are one of the foundations of the civil service system as a whole and the activities of civil servants in particular; this was prescribed in

the Concept for reforming the system of the state civil service of the Russian Federation (approved by the President of the Russian Federation on August 15, 2001). This principle is repeated in the regulatory legal framework and doctrinal documents, and this gives it undoubtedly great importance. The following were also adopted:

- The federal program "Reforming the state civil service of the Russian Federation" (2003–2005) which lasted until 2007. As it was indicated in the document, the need to reform the state civil service was largely due to "violating the principle of unity of the state civil service and its management system at the federal and regional levels."
- The federal program "Reforming and developing the system of the state civil service of the Russian Federation (2009 – 2013)" which was aimed at creating the management system for the state civil service. Due to the absence of such a system, the authors of the program saw the inefficiency of the entire system of state and municipal management. There were also serious drawbacks in the work of structural divisions of state bodies that implemented the legislation of the Russian Federation on state civil service.

Since 2016, the main directions aimed at the civil service development are determined by the decrees of the President of the Russian Federation of August 11, 2016, No. 403 (for the period 2016–2018) and of June 24, 2019 (for the period 2019–2021).

In this way, the Decree of the President of the Russian Federation of June 24, 2019 No. 288 "On the main directions for developing the state civil service of the Russian Federation for 2019 – 2021" contains the following directions:

- Improvement of the procedure for appointing citizens of the Russian Federation and state civil servants of the Russian Federation to positions of the state civil service of the Russian Federation.
- Stimulation of civil servants to increase the efficiency of their professional activities, development of the system of state legal and social guarantees in the civil service.
- Introduction of new forms of professional development of civil servants, including the use of information and communication technologies.
- Accelerated introduction of information and communication technologies in government agencies to improve the quality of work.

Among the main tasks is the introduction of motivation systems aimed at improving the quality of personnel work, systems of professional training, and development of state civil servants (Kalmykov and Krasnopolskiy 2016).

Improving the legal regulation of federal and regional personnel policies, delineating competencies, and determining the subject area of joint jurisdiction of state bodies at various levels remains an urgent task. The great importance of this issue becomes clearer if we consider that the majority of state civil servants are employed not in the central but in the regional bodies of the federal executive power, almost quarter of them work in parliamentary, judicial, prosecutorial, and control-accounting structures.

## Conclusion

The analysis shows that the existing system of normative-legal regulation of the state civil service is a complex of acts of different legal power and various affiliations: some of them apply to all state civil servants, others – to a certain group of people, most often employed in a specific field and at a specific level of government.

The main directions aimed at improving the efficiency of the state civil service are:

1. Transformational changes in the organizational structure and management processes. State civil servants work in structures with a strict hierarchy. Government structures and business processes need to be regulated because only in this case, there is a possibility for government officials to work together and innovate. The main problem that may arise is to achieve

balance of responsibility, honesty, and accountability, especially in terms of financial management and public procurement.
2. Improvement of the organizational culture of civil servants.
3. Improvement of personnel policies, including recruitment procedures, efficient systems of remuneration, and promotion systems. The Decree of the Government of the Russian Federation No. 397 of March 31, 2018 approved a unified methodology for holding competitions for filling vacant positions in the state civil service of the Russian Federation and including in the personnel reserve of state bodies. Recruitment mechanisms, including exams and interviews, need to be improved to facilitate the recruitment of employees with new competencies and skills. Assessment methods should consider not only knowledge but also the attitude and behavior of an official in state civil service. Job descriptions should not restrict or hinder the initiative of a state civil servant. Remuneration systems should be improved to reward those civil servants who are particularly effective and innovative.
4. Modernization of the education and training system for state civil servants.

Advanced training of civil servants; Professional development of civil servants; Professional retraining of civil servants; Qualification upgrade of civil servants; Upgrade training of civil servants

## Definition

The system of civil servants training in Russia is a system that provides a framework for continuous professional and personal development of civil servants for the public administration system and includes various levels of professional education and professional development to be carried out in compliance with special educational standards in the sphere of public administration and municipal administration.

## Introduction

The system of professional training of civil servants in Russia is directly influenced by the national professional education system and the

system of professional development, as well as by the existing system of civil service positions (grading system). In the view of this, it is necessary to note that there are several levels of professional education in Russia: secondary vocational education (usually education at a college for those who do not study for a degree), Bachelor's level, Specialist's level, Master's level, Postgraduate's level (for those who want to receive a research degree, an analog of PhD). At the same time, professional development can be in form of professional training (short training programs) or professional retraining (educational programs above 500 academic hours).

Obviously, citizens with different educational backgrounds (in spheres of management, law, economics, political science, etc.) can join civil service. But in this study, the analysis is focused on specialized training for the system of public administration.

## Professional Education of Civil Servants

An important distinctive feature of the professional education in Russia is that it is carried out in accordance with federal educational standards, while some leading educational institutions have the right to adopt their own educational standards (the requirements should be not less than in federal standards). Federal educational standards are approved by the governmental authority responsible for the development of public policy and legal regulation of the corresponding level of educational system (these functions are performed by the Ministry of Science and Higher Education in case of higher education programs in Russia). A federal educational standard establishes the timing of programs, the areas of professional activity of graduates, the types of formed professional skills (competences), the program structure requirements, and the requirements for the execution of the program, including the qualifications of the teaching staff.

There are two key federal educational standards for the professional education of the public administration personnel. These standards have the same name – "Public and Municipal Administration," but these standards are different documents with different content and requirements for Bachelor's (2014) and Master's (2014) programs. There are no specialized governmental standards of civil servant professional education for the level of secondary vocational education, as well as for postgraduate studies.

Higher educational institutions in Russia (academies, universities, institutes) regularly (every 6 years) undergo accreditation to confirm compliance with the requirements of federal educational standards. The accreditation procedure is carried out by a specially created governmental authority – the Federal Service for Supervision of Education and Science.

School graduates usually enter the bachelor's educational level programs after studying for 11 years at school level. The admission is based on the results of the Unified National Exams to be passed by school graduates. To start higher educational programs in sphere of "Public and Municipal Administration," an applicant needs to provide the results of Unified National Exams in several disciplines (usually three), the most common are "Russian language," "Social studies," "Mathematics," "Foreign language," or "History." The term of study at full-time bachelor's program is 4 years. In addition to studying process, undergraduate students usually undergo internships in governmental structures, sometimes starting from the very first year of education.

After the completion of the bachelor's programs, students have the opportunity to take entrance tests to be admitted to the master's level. There are no Unified National Exams after bachelor's programs and thus each institution sets its own admission examinations independently. The term of full-time study at master's level is 2 years. It is important to note that a master's level program in sphere of "Public and Municipal Administration" can have the students who previously received bachelor's education in another sphere, e.g., in sphere of economics, etc. During the process of education at master's programs, many students already start their civil service careers (master's degree classes that usually take place in the evening contribute to this).

It should be noted that professional educational programs of higher education at the bachelor's and master's levels can be organized in full-time, part-time and distance forms, with a corresponding increase of the total duration of the program.

Education can be funded both from the government budget or paid by students independently. Form of education funding is determined by the results of the competitive entrance examinations. Those students who study at the expense of the government budget receive additional scholarships.

A special form of interaction between a student, an educational institution, and a future employer is targeted training. In this case a tripartite agreement is concluded, which, on the one hand, provides for the funding, for example, by a state body, of a student's educational process, and on the other hand, the student's obligation to work after the graduation for that public body for a certain period.

As it was mentioned above, there is no specialized program in spere of "Public and Municipal Administration" for the postgraduate level, although the possibility to create such a program has been discussed for a long time. At the same time, there is a number of areas for postgraduate studies that have public administration implication (e.g., legal sciences, especially in fields of constitutional law and administrative law; national economy; political science; sociology of management, etc.). Despite the fact that a postgraduate degree is not acting as a specialized qualification requirement to fill a top civil service position, more than 10,000 civil servants in Russia have it (there is subdivision of postgraduate degrees in Russia into so-called candidate of sciences and a doctor of sciences).

## The System of Civil Service Positions and Educational Qualification Requirements

The legislation of the Russian Federation, when defining the state civil service, directly indicates that this service is professional, i.e., should be carried out with appropriate professional education. Moreover, this goal is also set forth within the basic principles of the civil service, one of which is "the professionalism and competence of civil servants."

There is a direct interrelation between the classification of positions of civil service and the educational qualification requirements in Russia. All positions of the civil service in Russia are divided into groups and categories. Categories are "heads," "assistants (advisors)," "specialists," "supporting specialists," and characterize each civil service position in terms of the essence of the tasks performed. Groups (in descending order, direct translation of terms) are "highest," "main," "leading," "senior," and "junior" and characterize each position in terms of its place in the national hierarchy of public administration. Thus, each position belongs to a certain category and a group at the same time, e.g., "Leading Specialist."

To fill the civil service positions of such categories as "heads," "assistants (advisers)," "specialists" of the highest or main groups, it is necessary to have a higher education not lower than the level of a specialist or master. To fill the civil service positions of such categories as "heads," "assistants (advisers)" of the leading group of positions, the category "specialists" of the leading and senior groups of positions, as well as the category of "supporting specialists" of the main and leading groups of positions, a candidate should have at least a bachelor's degree. To fill civil service positions of the category of "supporting specialists" in the senior and junior groups of civil service positions, at least secondary vocational education is required.

It is not always enough to have a certain level of education to fill a position in the system of public administration; it is also necessary to have some work experience that corresponds the received professional education. The requirements for professional experience or length of service are established by presidential decrees and depend on the group to which a position belongs. For leading, senior, and junior positions,

there are no professional experience requirements, a candidate for main group positions should have 2 years of professional experience; for highest group, 4 years of professional experience.

Every civil service position also has a prescribed list of spheres of professional education that a candidate for such position should have. Usually, such list includes professional education in sphere of "Public and Municipal Administration," but also can foresee specialized professional education requirements in particular sphere, e.g., legal education for a civil servant of a legal department. The Ministry of Labor and Social Protection establishes recommended professional education requirements to fill various positions in the public administration system.

## Professional Development of Civil Servants

The professional development of a civil servant is carried out on a systematic basis throughout the entire period of a civil service career and foresees acquisition of new knowledge and skills, development of professional and personal qualities, and is aimed at maintaining and improving the qualification level that is necessary for the proper performance of official duties by civil servant.

The main principles for qualification improvement and professional additional training imply that such courses are obligatory, frequent, and target oriented (Eroyan et al. 2015).

The main directions for the development of civil service are approved by presidential decrees on a regular basis. For the period till 2021, one of the key areas of such development is the introduction of new forms of professional development of civil servants, including forms that provide for the use of modern information and communication technologies. The major measures to achieve the goal of presidential decree are usually set forth within a "road-map," which is adopted by the Cabinet. The current road-map foresees the creation of a national web-platform for professional development of civil servants, as well as working out updated guidelines for monitoring the quality of educational programs for civil servants.

The professional development of a civil servant may include:

(a) Additional professional education.
(b) Seminars, trainings, master classes, other activities aimed primarily at accelerating the acquisition of new knowledge and skills by civil servants.
(c) Conferences, round tables, internships, other activities aimed at experience exchange and studying of advanced public administration technologies.
(d) Independent study of educational materials and distant courses that are offered by national educational platform for civil servants.

Professional development programs for civil servants may be organized on off-the-service or on-the-service basis. Also, the professional development of civil servants can be carried out both within Russia or abroad.

The results of civil servant professional development activities can be taken into account when reviewing a civil servant performance, adopting a decision to send a civil servant to another professional development program or promoting to a higher position.

Additional professional education can be carried out in forms of short professional training programs, with a term of at least 16 academic hours (1 academic hour – 45 astronomical minutes), or professional retraining programs, the duration of which is at least 500 academic hours.

There are different grounds for sending a civil servant to participate in professional development activities:

1. The decision of an employer.
2. The results of performance review.
3. The appointment of a civil servant to another position in case of position reduction or in the event of the abolition of a public agency.

4. The promotion of a civil servant to a high-ranking position for the first time.
5. Admission of a citizen to the civil service for the first time.

The professional development of civil servants may be organized by the means of:

1. Public procurement of professional development programs for civil servants.
2. Public assignment (a special governmental task to a publicly founded institution to organize the process of education).
3. Educational certificate.

Planning of the professional development of federal civil servants is performed by the Ministry of Labor and Social Welfare and this process is based on the requests from other federal agencies to be filed no later than July 1 of the year preceding the planned.

The Ministry of Labor and Social Welfare also negotiates annually with the Presidential Administration and the Cabinet Office the priority areas of professional development of civil servants. The Ministry submits proposals to the Cabinet on the organization of centralized training for civil servants, as well as the amount of funding to be spent through the public procurement procedures, public assignment, and educational certificates.

An educational certificate for additional professional training is a relatively new way of professional development of civil servants. Such certificate serves as a personalized document confirming the appropriate right of a civil servant to undergo training in an educational organization included in the special register. Training of a civil servant who have received educational certificate is carried out during the year in which the educational certificate is received. The choice of an educational program financed by a certificate is performed by a civil servant in agreement with an employer or an immediate supervisor.

Other professional development activities may include mentoring and internship opportunities. Mentoring is carried out by persons with extensive experience in a particular field, and carried out to raise awareness of civil servants on the scope of activities and objectives of the governmental agency, the current challenges, as well as the acceleration of adaptation of a civil servant, who is admitted for the first time to the civil service or of a civil servant, who has civil service experience, but is new to this governmental authority. Mentoring is also intended to develop civil servant's skills to independently, efficiently, and in due way perform functions, maintain long-term professional performance.

It is important to note that a civil servant cannot be mentored by his immediate supervisor. The mentor is appointed from among the most reputable, experienced and efficient civil servants. A mentor should not have disciplinary or corruption offenses, and should not be subject to an internal audit. A mentor can simultaneously mentor up to two civil servants.

The functions of a mentor include:

(a) Assistance in familiarizing the civil servant with the conditions of civil service.
(b) Presentation of recommendations to a civil servant on issues related to the performance of his official duties.
(c) Identification of mistakes made by a civil servant and assistance in their elimination.
(d) Transfer of accumulated experience, professional skills, demonstration, and explanation of the most rational methods of executing of official duties.
(e) Providing a civil servant with methodological assistance when he applies for professional advice.

An internship is an experience exchange activity aimed at learning of the best practices in the relevant area for the professional development of a civil servant. An internship can take place both in another governmental agency and in the same one. An internship can be organized both individually and for a group of up to 20 civil servants. The duration of the civil servant's internship may not be less than 5 days and more than 6 months. For the period of an internship, a civil servant retains the position and is paid the salary.

## Formation of Personnel Reserves, Training of Reservists and National Competitions for Public Administrators

The fundamental changes that are currently taking place in the Russian Federation in the economic and social structure and aimed at creating an innovative economy, require the emergence of new leaders, the influx of a new generation of highly professional and motivated management personnel in all spheres of public life. The issues of a better governmental personnel policy, the effective use of the professional and personal abilities of young specialists are especially acute (Ivanova and Negashev 2019). One of the most important tasks in the formation of a talent pool is to carry out targeted work to improve the professional level of persons included in personnel reserves (Suk Kim and Kotchegura 2017).

The Russian Federation has a unified system of personnel reserves at various levels. It includes a reserve of personnel under the patronage of the President of the Russian Federation; federal reserve of public administration personnel; regional reserves of administrative personnel; municipal reserves of personnel. District personnel reserves may be also created at the level of federal districts.

Personnel reserves are created primarily for promotion appointments. The presence of a citizen in a reserve, formed mainly on a competitive basis, serves in the future as the basis for an appointment without competitive procedures.

Citizens and civil servants can be included into the personnel reserves by several ways: according to the results of a competition, according to the results of performance review (certification), in the event of a reduction in positions in a governmental agency or termination of a service contract due to circumstances beyond the control of the parties (e.g., conscription of a civil servant for military service).

Taking into account the principle of continuous improvement of the personal and professional resources of reservists, they may undergo professional development programs.

Priority for participation in training programs and educational activities is given to persons planned for promotion or with the highest level of managerial potential.

In order to reach the indicated tasks of improving the organization of work with the national reserve of administrative personnel the federal program "Training and retraining of the reserve of administrative personnel (2010–2021)" was adopted in 2010. In accordance with this program, the national reserve is subdivided into the highest level (includes representatives of the presidential reserve, as well as the leadership of governmental agencies of federal and regional levels, as well as top-management of state corporations and organizations), basic level (administrators of the middle level of governmental agencies of federal and regional levels, as well as public corporations and organizations), and prospective level (civil servants, as well as employees of public corporations and organizations under the age of 35).

Since that time more than 2.7 thousand people has taken part in different activities under the national reserve training personnel program. The personnel reserves of federal agencies comprise about 96.6 thousand people, the regional reserves of administrative personnel consist of about 9.6 thousand people.

The key indicators of the effectiveness of the personnel reserve's usage are the number of appointments made from reserves, as well as the ratio of the total number of appointments and number of appointments from reserves.

The breakthrough project aimed at the formation of the pool of the most talented and promising public administrators is called "Russia – the country of opportunities." Within the framework of that project, many different competitive events for various age and professional groups are held. The most significant are national managerial competition "Leaders of Russia" (which just in a few years embraced literally hundreds of thousands of leaders from across the country), as well as the All-Russian competition for students "I'm a Professional" in sphere of "Public and municipal administration." The winners of these competitions receive advantages for professional promotion and career development, in particular, the finalists of the "Leaders of Russia" competition receive an educational certificate for about

14 thousand US dollars, which they can use to study at almost any educational program; the winners of the "I'm a Professional" competition receive funding benefits for consequent education.

## National School of Public Administration

Training of personnel for the public administration system and their professional development are impossible without creation of a national scientific and professional educational center. Undoubtedly, there are many higher educational institutions that train personnel for the public administration system in the Russian Federation – these are large regional universities, leading educational institutions of the federal level (e.g., Moscow State University, St. Petersburg State University), and a number of universities subordinate to one or another governmental agency (e.g., the Financial University under the Cabinet of Russia, the Moscow State Institute of International Relations under the Ministry of Foreign Affairs of Russia). However, the only one higher educational institution under the President of the Russian Federation is the Russian Academy of National Economy and Public Administration (RANEPA).

Currently RANEPA is the largest educational institution in Russia with 54 branches in 8 federal districts of the Russian Federation covering 47 regions of the country. More than 180,000 people are being trained at RANEPA across Russia. The total number of students in its regional branches is more than 81,000, of which 67,000 are in the bachelor and specialist programs, about 9,000 are master's students, and over 5,500 are in vocational degree programs. More than 1,700 foreign students are enrolled with the regional branches of the Academy. The number of its full-time employees is about 6,500 in Moscow and about 7,500 in regional branches. Overall, RANEPA employs 6,100 academic staff: nearly 780 Full Professors, 2,500 Associate Professors, and almost 5,200 holders of advanced degrees, including 1,600 Doctors. The Academy delivers professional degree programs including 113 bachelor's programs, 11 specialist's programs, nearly 150 master's programs, and 7 vocational degree programs. RANEPA has developed and is implementing more than 500 additional professional education programs.

The Academy offers postgraduate and doctoral programs in 10 areas of study. From September 1, 2017, the Academy is authorized to establish advanced degree awarding boards (including doctoral). The Academy's research and expert activities as the largest consultant for development projects and programs implemented by federal and regional authorities, corporations and public organizations, contribute to continuous improvement and updating of the educational process.

RANEPA is the ideologist and project developer of the continuous education system in Russia (Safronova and Kosareva 2016). The Academy has developed a concept for the modern system of continuous education for civil servants, to help modernize the system of advanced training and retraining of civil servants in the Russian Federation.

In accordance with the order of the Government of the Russian Federation, the Academy was appointed as the sole contractor for the program of training and retraining the above-mentioned top-level administrative personnel reserve. The Academy also cooperates with the regional governments in training civil servants and implementing programs aimed at developing the national economy.

The Presidential Academy is often the initiator and pioneer in the use of advanced foreign experience in organization of personnel training for the public administration system. In 2008, RANEPA launched its first Master of Public Administration (MPA) program within the Institute of Public Administration and Civil Service, and this program has already received a number of prestigious Russian and international accreditations.

The accumulated experience for professional training and retraining of public administration personnel, as well as the request for educational programs for high-ranking officials, where they could significantly deepen and rethink existing knowledge, develop new soft-skills as well as

conduct work under scientific research projects – have created grounds for the initiation of the first Doctor of Public Administration (DPA) program in Russia that also started within RANEPA in 2019. At the same time, taking the international DPA approach as a basis, the Presidential Academy supplemented it with new approaches to the architecture of the educational process, the approach to the selection of experts and speakers, supplementing the program with the practice of mentoring from prominent governmental official, as well as advanced requirements for research and publication activity. One of the existing prospects and trends in the development of MPA and DPA programs in Russia is their further deeper synchronization with traditional Russian master's and postgraduate's programs.

## Conclusion

There is a complex system of selection, training, retraining, and professional development of civil servants for the system of public and municipal administration in the Russian Federation. This system embraces various categories of citizens, starting literally from school graduates and up to interaction with the top public administration officials. The promising trends of the professional training of civil servants are the digitalization (Sidorenko et al. 2019) of the educational process with more active use of distance learning technologies, individualization of educational trajectories of professional development, the wider use of soft skills, mastering the project management approach, the development of "case libraries," as well as stopping the traditional system of civil servants training "every three years" and the transition to more flexible and tailored short-term training programs.

R

## Synonyms

Crisis management; Economic crisis; Public crisis governance; Public crisis management; Sustainable development

## Definition

*Public crisis management* is an approach to economic crisis overcoming based on the domination of operative, reactive measures with selective support of beneficiaries.

*Public crisis governance*, on the contrary, includes strategic, long-term mechanisms, systemic approach to government support of economics (based on unified legal system and regulating institutions of development instead of selective funding), and long-term policy aimed at sustainable development, i.e., support of adequate standard of living for the present generation and no decline in living conditions for the next generations.

## Introduction

In the later decade, Russia faced two severe economic crises. The first crisis of 2008–2009 was triggered by global economic fluctuations, but as a result Russia was one of the most affected economies: in 2009 gross domestic product (GDP) in Russia decreased by 7.9% (while in Japan by 6.1%, in Europe by 4%, in the USA by 3%). Such key economic indicators as industrial production, investments, real wages, and real household incomes also demonstrated negative dynamics (Aganbegian 2018). These dramatic consequences were the result of cumulative deformations of the Russian economy's structure, high dependence on exports of natural resources, low competitiveness of non-resource industries, immaturity of the financial system, and market institutions as a whole (Bobyleva et al. 2011, 11).

After the short period of economic rehabilitation and slow growth till the end of 2012, the next crisis of 2014–2015 occurred. It was provoked by both external factors and internal reasons. Geopolitical conflict followed by international economic sanctions, significant drop in world oil prices coupled with remaining cumulative deformations, and only partial implementation of government stabilization measures (monetary policy aimed at inflation targeting and contraction of money supply, currency devaluation, increase of key interest rate, etc.) have led to the deep recession.

The government had to react to each crisis taking into account its nature and specific consequences. Policies of crisis overcoming had to include both urgent actions to "put out the fire" and long-term measures aimed at restarting economic growth.

According to the authors' idea of crisis management as a built-in stabilizer of sustainable economic development, plans of crisis management at the public level should provide long-term sustainability, but acute crisis also demands an appropriate reactive response to arising challenges. This paper examines the process of reconciling public governance and economic development for overcoming crises and justifies that current Russian public crisis policy includes majorly short-term stabilizing measures without a general systemic strategy of long-term sustainable economic development, i.e., "public crisis management" prevails over "public crisis governance."

## Tasks and Instruments of Public Governance for Crisis Overcoming

Public crisis governance is usually aimed at providing maintenance of the market environment, the functioning of the monetary mechanism, production of public goods, managing inflation and unemployment, and the stimulation of economic growth. The main public tasks here include creating a highly competitive economy, economic restructuring, ensuring social protection and increasing the standards of living, increasing the sustainability of the financial and banking systems, strengthening the position of the country in the international community, and personnel retraining at all levels (to adapt to market conditions to workers who have lost jobs due to economic restructuring).

Concrete tasks of public management in the acute phase of crisis include:

- Facilitation of access to financial resources
- Reducing the tax burden for business
- The development of special crisis management programs and plans on federal and regional levels
- Boosting the internal demand
- Strengthening social protection and support of unemployed and poor people

In general, the key elements of public crisis governance can be considered as follows:

- Forecast of changes in the phases of the macroeconomic cycle and their impact on the organizations' activity
- Development of management models and technologies for action during organizational crises
- The use of macroeconomic technics for enterprises in all phases of the cycle to moderate the transformational period and crisis
- Identification and assistance for distressed companies that can be recovered along with effective bankruptcy proceeding conduction of indebted companies beyond the economic rescue
- Control over the organizations' activities both directly in the period of crisis and at all stages of macroeconomic cycle by determining the zone of the main indicators' volatility

As a whole, methods of public economic regulation applied to prevent and overcome crisis can be divided into two groups:

- *Administrative methods* imply direct impact on the economics through the development of legislative framework, control over the activities of economic entities, and the usage of sanctions
- *Economic methods* include market instruments of influence on business entities through fiscal and monetary policy, currency regulation, impact on property relations, State participation in companies' capital, etc.

Application of each group depends on the phase of economic cycle. During the growth period, the State policy should prevent a possible "overheating" of the economy and improve social protection using fiscal policy. In the recession phase where a decrease in production volumes occur, public governance is aimed at boosting business activity and the development of new production and technologies by usage of both soft, indirect economic methods and direct administrative influence. In the crisis phase, public crisis management is realized through activation of both administrative and economic methods.

The main instruments of public crisis management include:

- Monetary policy
- Tax (fiscal) policy
- Currency regulation
- Relationship with foreign capital
- Property relations
- Insolvency regulation

## Monetary Policy During Crisis

Monetary policy is aimed at the achievement of economic growth, stable prices, full employment, increase of real production level, and sustainable account balance. The main tools include management of interest rates, rates of mandatory reserves, and open-market operations.

During crisis the central bank usually provides "easy monetary policy" by decreasing interest rates, rate of mandatory reserves, and buying securities of commercial banks. These measures increase liquidity of bank system, provide expansion of crediting, and improve investment conditions which leads to the production and employment increase. However central banks usually quite rapidly exhaust possibilities of traditional market tool application, while the crisis becomes deeper or the stagflation appears.

The crisis, which took place in 2014–2015, was provoked by both external factors (geopolitical conflict followed by international economic sanctions, significant drop in world oil prices, etc.) and internal reasons, including the abovementioned remaining cumulative deformations and only partial implementation of government stabilization measures (monetary policy aimed at inflation targeting and contraction of money supply, currency devaluation, increase of key interest rate, etc.). The Russian government had to react to each crisis taking into account its nature and specific consequences. Anti-crisis policies had to include both urgent actions to "put out the fire" and long-term measures aimed at restarting economic growth.

**Russia: Reconciling Public Governance and Economic Development for Overcoming Crisis, Table 1** Distribution of measures and funding between industries in public crisis management Programs 2009–2010 and Plans 2015–2016

| Criteria | Program 2009 | Program 2010 | Plan 2015 | Plan 2016 |
|---|---|---|---|---|
| Blocks of measures | Number of measures (sum of financing, bln rub) | | | |
| Social support of population | 43 (695.8) | 2 (19.2) | 9 (296.2) | 11 (38.3) |
| Financial system (banks) | 13 (495) | 1 (1) | 15 (1960) | 9 (21.85) |
| Innovations/import substitution | Innovations: 10 (–) | – | Import substitution: 5 (4) | Import substitution: 4 (–) |
| Business support (including SME development) | 44 (633) | 7 (–) | 2 (–) | 2 (2.2) |

In particular, actions of the Bank of Russia within crisis of 2014–2015 were opposite: due to the national currency devaluation and increase of currency speculations, the Bank of Russia increased the key rate up to the critical level of 17.5% which led to the short positive effect. Bank system liquidity was supported by huge direct financial injections to increase their capitalization and foreign currency obligations repayment (Table 1).

## Budgetary and Fiscal Crisis Management Instruments

The main instruments of the public fiscal policy are government spending, taxes, and transfer payments which help to regulate cumulative demand. Depending on the phase of the cycle, the State implements a certain type of fiscal policy. During crisis with slack economy and production recession as a consequence of insufficient effective demand, the State usually realizes policy of cumulative demand expansion.

Taking into account that investment and consumption are the main components of cumulative demand, an increase in government spending (financing and lending to private entrepreneurs from the state budget, facilitating of government procurement of goods and services, transferring inter-budgetary payments for reduction inequalities of wealth and support of poor people) leads to the facilitation of investment and the propensity to consume.

Reducing business taxes stimulates economic growth, allows companies to leave more funds for development, and leads to an increase in the supply of factors of production and an increase in economic potential, while reducing taxes for the population increases consumer demand.

The crisis of 2008–2009 triggered new changes of the tax system in Russia: a reduction in the profit tax rate from 24% to 20% and changes in VAT payment on technological equipment imports, but the impact of these measures was not fully realized. One of the most discussed tax measures of Plan 2015 was providing an opportunity for regions to decrease tax rate within a simplified taxation regime, but in many regions financial problems were so great that they could not afford to reduce budget incomes in such a way.

During 2000–2014 the federal budget was steadily growing and increased more than 12 times due to the high oil prices and the so-called "tax maneuver" (Bobyleva 2015, 7; Lvova 2015, 69). The prevailing concept of financial and economic sustainability growth was to provide a budget surplus. Rosstat (Russian Federal State Statistics Service "Rosstat") data shows that this directive was realized from the middle of the 1990s and was interrupted only by short periods of 1995, 2009–2010, and 2013–2015 when a fiscal deficit took place (Russia in figures 2011, 2014, 2015). It should be noted that the trend of economic development with a budget deficit does not necessarily indicate negative economic dynamics: economies of many countries successfully function having fiscal deficit. However, taking into account relative isolation of Russia from the external world

nowadays and uncertainty of additional fund attraction, control of fiscal deficit and appropriate management become an important task for increasing of sustainability.

## Real Sector of Economy: Large and Small-/Medium-Sized Enterprises (SMEs) Support

A special feature of the Russian economy is an overwhelming domination of large enterprises: nowadays their share is about 82% (Statistical Yearbook of Russia 2018). It is primarily explained by the resource structure of economy: the presence of large mineral deposits lead to the existence of appropriate large-scale extracting and refining enterprises.

The dependence of the economy on large-scale business led to the formation of special conditions for their sustainability support. In particular, in the end of the 1990s, the so-called "strategic" and "city-forming enterprises" were selected, and then "system-forming enterprises" were introduced in 2008. They receive priority support from the government and strive to obtain such status. It should be emphasized that such categories of enterprises are indicative only for the Russian economy and certain post-soviet countries. In developed economies similar enterprises are full participants of the market economy and global competition; they generate level of profit appropriate for development or go bankrupt.

The Russian concept of large business sustainability is based on significant participation of the State in their equity, selection of strategic and system-forming enterprises, foundation of State corporations, and providing them with financial support in different forms.

A necessary component of the country's economic sustainability increase is the development of small and medium entrepreneurship (SME) which plays an important role in employment performance and social tension diminishing. Thus, from the beginning of the transition, programs of SME support were declared as priority projects and were included in the public system of economic sustainability growth. The government provided the following main measures: simplified rules for accounting and reporting; implemented special conditions for SMEs' participation as suppliers and contractors within government procurement; rendered financial support for SMEs and its infrastructure development (business incubators, techno parks); and simplified tax mechanisms through patent system expansion.

In general, indicators of the real sector of economic development during the first 20 years of reforms illustrate growth (except for the crises periods of 2008–2009 and 2015–2016). Nevertheless, the influence of the crises led to a reduction in turnover dynamics and financial result in the real sector (Statistical Yearbook of Russia 2011, 2014, 2015). The low indicators of the real sector resulted from many factors: underdevelopment of Russian institutions "responsible for sustainability," the global economic situation, volatility of demand and prices level, etc.

Special attention should be given to such factors of low growth as a high degree of fixed asset depreciation (achieved 49% in 2014 from 37% level in the beginning of the 2000s (In main revenue-generating (extraction and refining) industries, depreciation is even higher (up to 54%) along with 20% of fully depreciated assets. Ratios of renovation and retirement of fixed assets confirm this trend: renovation ratio does not exceed 5%, while retirement ratio during the last 6 years achieved less 1% level.)) and high investment needs (Russia in figures 2011, 2014, 2015). Increased depreciation resulted from low growth rates of capital inflow and reduction of long-term investments into the economy. To support economic sustainability, the government considers an increase of the share of budgetary financing, but there are not enough funds for this.

In conclusion, the study of indicators of the real sector of economic development along with the abovementioned indicators of living standards and GDP dynamics confirms that during the research period, budgetary funds were transferred primarily not for economic development and long-term sustainability but for immediate consumption and social stability provision. Real wages were growing without simultaneous growth of effectiveness and workforce

productivity. So, the conditions for long-term sustainability were not established in full during this period.

## Comparative Analysis of Public Crisis Management Programs 2009–2010 and Plans 2015–2016

Crisis management strategy of the government can be illustrated through the analysis of certain Programs and Plans and their contribution to sustainable development. It should be evaluated which of the measures can be considered as effective ones in long-term perspective in terms of sustainability improvement; which of the measures can be applied in the most volatile periods to get immediate results; and which of the measures are still relevant and which of the measures should be rejected.

The comparison of formal attributes and technical differences shows that the Program 2009 was developed in more detail than later documents: the number of its pages twice exceeds the Plan 2016 and is three times more than the Plan 2015. However, the number of measures in Program 2009 and Plan 2016 is almost the same (120 and 123 consequently). It can signify that measures of Plan 2016 are named but defined less thoroughly than in Program 2009.

Program 2010 generally goes along the lines of the previous one of 2009 and includes similar measures, but it is not informative and hard for perception: it contains only 12 pages; the structure of data is the worst among all of the reviewed documents. The program seems declarative: concrete mechanisms, responsible authorities, time periods for implementation, and required financing are not specified.

A positive distinguishing feature of the Plans 2015 and Plan 2016 is the setting of strategic goals: their titles include "sustainable development" (2015) and "stable social economic development" (2016), while the Program 2009 was aimed at reactive "crisis" response.

The volume of funding and chosen priorities constitutes the principal difference of all reviewed documents. The largest investments were provided for Program 2009 and Plan 2015 (more than 2.2 bln rubles each) as they were adopted in the critical periods of crises. Nevertheless, in real terms the sum of financing in 2009 was the largest (approximately 50% more than in 2015) taking into account the average inflation rate and drop of purchasing capacity of Russian currency during 2009–2016.

Comparison of blocks of measures illustrates that the main priorities in public crisis regulation in Russia were changing during this period, while "social stability maintenance" was common for all the documents but to a varying degree. In the Program 2009 social support of the population, performance of social commitments, and human capital development (social security, education, healthcare) are announced as the main priorities with maximum financing. In 2015 primarily bank system support was preferred due to devaluation of the national currency. In 2010 the main financing was addressed to the development of military-industrial complex, in 2016 to inter-budgetary lending. Such a change in the priorities of financing can illustrate either erratic escalation of the crisis in certain directions or inconsistence of public policy, absence of strategy, and choice of "patching the holes" tactics. So, in Russia stable repetitive crisis measures prevail, but they do not improve sustainability, while tactics changes, the strategy remains the same.

Each Program and Plan suggested certain industries for priority support and highlighted concrete beneficiaries of financial support which confirms the presence of both systematic and selective measures (Table 2).

So, in accordance with the Program 2009, a major part of finance was spent on selective support of the Russian automobile producer PJSC "AvtoVAZ." The automotive industry as a whole is declared as a concrete beneficiary in three of four considered documents. Almost a similar set of protectionist measures for system-forming automotive producers is considered by the Plan 2015 and by the Plan 2016. Another main beneficiary of public financing during the crises is PJSC "Russian Railways." It is financed both directly (compensation of lost earnings) and indirectly (prolongation of 0% VAT rate for passenger carriage services by suburban traffic).

**Russia: Reconciling Public Governance and Economic Development for Overcoming Crisis, Table 2** Support of large-scale business in public crisis management Programs 2009–2010 and Plans 2015–2016

| Criteria | Program 2009 | Program 2010 | Plan 2015 | Plan 2016 |
|---|---|---|---|---|
| Blocks of measures | Number of measures (sum of financing, bln rub) | | | |

As a whole Programs of 2009–2010 declared activation of modernization vector, but, in reality, financing of industries and businesses was provided mainly by writing-off bad debts, allocation of subsidies, and lending at preferential rates. A set of measures shows that public support to business was considered as a means of preventing the collapse and activity termination. In general, neither formation of conditions for innovations nor science and technologies development was specified by concrete measures in spite of declared priorities.

In 2015 the main tool of large business support became the provision of public guarantees of loans or federal loan bonds (10% of the whole funding of the Plan). On the one hand, this opportunity was available only for certain companies or

borrowers selected by the government. The guarantees were intended for project realization, but financing current debts restructuring was also allowed. Plan 2015 identified only three concrete beneficiaries of direct financing which is less than in all other years (Table 2) but suggested broad public guarantees at loans for system-forming enterprises, support of airlines and civil aircraft producers, etc. In practice a certain part of funding for bank system recapitalization announced by Plan 2015 was transferred to strategic enterprises – for example, in 2015 PJSC "United Aircraft Corporation" received a capital increase by the State of 100 bln rub.

Plan 2016 contained less measures addressed to large business support. They were also short-term and imply subsidizing of industrial enterprises as compensation of interest payments and enlarging working capital and (or) financing of current activity.

In all crises, public measures of SME support mainly concerned organizational and legal aspects: elimination of administrative barriers, reducing the frequency of inspections, adjustments to the mandatory quota for SMEs in public procurement, and strengthening of anti-corruption activities. In 2009, the important vector of SME development became the program of its financial support through commercial banks. Program 2010 supposed active involvement of SMEs in modernization and innovative activities, but most of measures were not fully realized.

In crisis of 2015 SME support included mainly grants to small innovative enterprises in total volume of 2 bln rubles. However, this part of Plan 2015 contained the most concrete measures and resulting indicators: extended basic requirements to receive SME status to make it more popular and legalize citizens' commercial activity and extended access to public procurement. In Plan 2016 SME support suggested new measures of business pressure reduction: decrease of government control of entrepreneurs by setting limits on the frequency of examinations and extension of legal opportunities to apply suspended sentence for first-time economic offences.

As a whole an analysis of public crisis management programs and plans shows that they are similar in many aspects and illustrate stable policy: the main financing is provided to large companies or banks, and business support is primarily aimed at helping "strategic" and "system-forming" enterprises; SMEs are mainly stimulated by tax preferences which depend on the decision of regional authorities and are not realized in full.

Plan 2016 considered as much measures as the sophisticated Program 2009 but had three times less financing due to the current deficit of public funds. Hard financial limits also explain declared strengthening of control and cost reduction policy: introduction of cost audit measures for natural monopolies and infrastructural companies, implementation of the "benefit-to-cost" principle to appraisal of capital intensive projects, performance audit of special economic zones, adjustment of public programs from the point of financial efficiency, and budgetary expenses reduction.

However, the majority of experts notice the absence of systematic reaction to the crisis: both Programs of 2009–2010 and Plans of 2015–2016 were aimed at quick prevention of the most acute crisis consequences by taking a selective, countervailing measure in the absence of a common strategy for improving sustainability. This is in contrast with Western countries.

## Conclusion

The strategy and tactics of public crisis governance may vary depending on the following conditions:

- The level of development of the economy
- National traditions
- Phases of the macroeconomic cycle
- The level of globalization and the international division of labor
- The degree of concentration and centralization of capital
- Budgetary, credit, and investment possibilities of the State and the financial and banking systems

During all the reviewed periods, the crises in Russia were overcome thanks to high oil and gas

revenues, significant imports (currently compromised by geopolitics and sanctions), and inter-budgetary transfers. However, the Russian economy remains unsustainable, dependent on the global situation, suffers from relative technological gap, and has exhausted its development model based on overdependence on extractive industries (Mau 2017). The mainstream crisis management policy in Russia was relatively stable, but it does not always contribute significantly to the long-term sustainability.

In general, sustainability criteria are incompatible with sustainability and describe the frequency of crises, the degree of dependence of the economy on external factors, the degree of the budget deficit, the level of economic independence of the regions, the effectiveness of the tax system, the level of performance of the State functions in the financial sector, and the diversification of the economy.

However, the last crisis management programs and plans in Russia contain addressed financial assistance to traditionally ineffective industries and ignore the tasks of economic diversification and long-term innovative development. The real steps to public crisis governance in the strategic perspective are still needed: shift from direct financial aid to ineffective companies to financing based on expected performance of each measure to overcome crisis.

# Russian Federation, Anti-corruption Policy

Igor Bartsits
Institute of Public Administration and Civil Service of the Russian Presidential Academy of National Economy and Public Administration, Moscow, Russian Federation

## Synonyms

Anticorruption laws; Anticorruption policy; Combating corruption

## Definition

Anticorruption activities include the activities of federal authorities, state authorities of the constituent entities of the Russian Federation, local self-government bodies, civil society institutions, and individuals who, acting within their powers, intend to: prevent corruption, including prevention and elimination of the causes of corruption (prevention of corruption); identify, prevent, stop, investigate, and solve corruption offences

(combating corruption); and mitigate and/or remedy the consequences of corruption offences (Federal Law No. 273 of 25 December 2008 "On Combating Corruption").

Fight against corruption is a universal value of constitutional law development, one of the top priorities of the internal and external policy of the state, and a critical contributor to the shaping of efficient systems of administration based on a universal approach to treating people within such systems across the globe and to their legal status – i.e., a complex of rights, duties, prohibitions, and restrictions that apply in the context of state service, public functions, elective positions, and current policy.

## Introduction

Combating corruption as a universal constitutional principle is defined by J.D. Savage (1994) and Z. Teachout (2009, 2014), as well as by a number of Russian authors such as T.Y. Khabrieva (2015) and V.I. Lafitsky (2019).

According to the United Nations Convention against Corruption (UNCAC) of 2003, not only governments, but also businesses should work against corruption (The Ten Principles of the UN Global Compact).

Most states adopt anticorruption strategies stipulating key focus areas of combating corruption, including: (a) introduction of measures designed to regulate civil service functions and public administration systems, including through ensuring transparency of public authorities and the public sector of the economy, regulating public service, and improving administrative justice; (b) criminalization of corrupt practices in the private sector based on understanding that corruption is particularly damaging where the interests of public administration and private business meet; (c) universalization of the principles of combating corruption as applied to the public and private sector, including openness and transparency of public administration, public and private sectors of the economy; prevention of conflicts of interests in both public and private sectors; introduction of codes of ethics for public officials and business corporations; independent audit of both government organizations and private businesses.

In other words, it is a modern anticorruption trend to counter systemic corruption in the sphere of public administration with a universal approach all nations should pursue in relation to bribery, profiteering, abuse of authority, and influence peddling. Previously perceived as an internal affair of individual states, corruption is becoming a reason to shape a new philosophy of governance – open and transparent, based on explicit rules that are understandable and enforceable, and with a reasonable system of punishment for offenders.

## Legal Foundations of the Anticorruption Policy of Russia

Russia made its first attempt to adopt a framework for anticorruption law in 1993 and then repeated it in 1995, 1997, and 2002. However, none of these bills has ever been finalized or passed.

A number of anticorruption measures were provided for by Federal Law No. 79 of 27 July 2004 "On Public Service of the Russian Federation." Thus, the law covers some moral and ethical aspects of public service (Article 4, Principles of Public Service; Article 18, Requirements of Conduct of a Public Servant, etc.).

In 2006, the Russian Federation ratified the UN Convention against Corruption of 31 October 2003 and the European Criminal Law Convention on Corruption of 27 January 1999. The Federal Law ratifying the UN Convention against Corruption of 31 October 2003 contains reservations concerning the excluded articles and paragraphs of the Convention. Thus, Russia did not ratify Article 20 "Illicit Enrichment," Article 26 "Liability of Legal Persons," Article 54 "Mechanisms for Recovery of Property through International Cooperation in Confiscation," and Article 57 "Return and Disposal of Assets." Besides, Russia has acceded to the Council of Europe Convention on Laundering, Search, Seizure, and Confiscation of the Proceeds from Crime of 1990 (2001), joined the Council of Europe GRECO (Group of States against Corruption) (2007), acceded to the OECD

Convention on Combating Bribery of Foreign Public Officials in International Business Transactions of 1997 (2012), and became a member of the Financial Action Task Force (FATF) (2003).

Having ratified international agreements on combating corruption, Russia put in place contemporary anticorruption legislation, which has in its core Federal Law No. 273 of 25 December 2008 "On Combating Corruption" (hereinafter FZ No. 273), the National Anticorruption Strategy (approved by Decree of the President of the Russian Federation No. 460 of 13 April 2010), and the annual National Anticorruption Plans.

Federal Law FZ No. 273 establishes key principles of combating corruption, prescribes corruption prevention measures, and sets a legal and organizational framework for management of corruption and minimization of the consequences of corruption offences. Later, by-laws were passed to concretize and amplify some of the provisions of the Law. The Law also gives legal definitions to terms, such as "combating corruption," and lists the principles of anticorruption policy, including: (1) recognition, safeguarding, and protection of fundamental human and civil rights and freedoms; (2) openness and transparency of government and local self-government authorities; (3) unavoidability of punishment for corruption offences; (4) use of comprehensive political, organizational, educational, socioeconomic, legal, special, and other measures; (5) high priority of anticorruption measures; (6) cooperation between the state, civil society institutions, international organizations, and individuals.

Federal Law FZ No. 273 also lays an administrative foundation for combating corruption, defines corruption prevention measures, and identifies the areas state authorities must focus on to improve the efficiency and effectiveness of anticorruption efforts.

Federal Law FZ No. 273 provides for international cooperation in the area of countering corruption, namely, between Russia and the United Nations Organization (UN), Organization of Economic Cooperation and Development (OECD), Group of States against Corruption (GRECO), Organization for Security and Cooperation in Europe (OSCE), and Asia-Pacific Economic Cooperation (APEC) forum.

Thus, pursuant to its international agreements and/or based on the principle of reciprocity, Russia counters corruption in cooperation with foreign states, their law enforcement agencies and special services, as well as international organizations in order to:

- Identify persons suspected/accused of corruption offences, locate them, as well as other persons involved in corruption-related crimes
- Identify property derived from corruption-related crimes or used to commit such crimes
- Provide, as necessary, objects or substances for examination or forensic analysis
- Exchange corruption-related information
- Coordinate anticorruption activities

There are other laws that play an important role in countering corruption, including: Federal Law "On Anticorruption Review of Laws and Drafts of Laws" (FZ No. 172 of 17 July 2009), Federal Law "On Control of Conformity between Expenses and Income of Public Officials and Other Persons" (FZ No. 230 of 3 December 2012) and Federal Law "On Prohibiting Certain Categories of Persons to Open and Detain Bank Accounts (Deposits), Keep Cash and Securities in Foreign Banks Outside the Territory of the Russian Federation, Possess or Use Foreign Financial Instruments" (FZ No. 79 of 7 May 2013).

Most anticorruption activities are conducted in the framework of the National Anticorruption Strategy approved by Decree of the President of the Russian Federation No. 460 of 13 April 2010 and six National Action Plans for Combating Corruption – of 2008, 2010, 2012, 2014, 2016, and 2018. Effective today is the National Action Plan for Combating Corruption in 2018–2020 approved by Decree of the President of the Russian Federation No. 378 of 29 June 2018. This Plan focuses on the problem of conflict of interests and extents the personal scope of application and list of control mechanisms.

The National Action Plan for Combating Corruption provides for declaration by public officials and their close relatives of their income and

property; forfeiture of illegally gained assets; repatriation of undeclared external assets; harsher punishment for corrupt business practices and bribes to employees of commercial firms; fines for transferring shares or other assets to public officials; strict regulation of employment by private firms of persons retired from public offices; enhancement of legal and social guarantees for public officials, etc.

Some anticorruption measures are provided for by RF laws on public service. Thus, Decree of the President of the Russian Federation No. 261 of 10 March 2009 approves a 5-year federal program of reforming and developing Russia's system of civil service. The priorities of the program are: prevention of corruption; creation of a mechanism for timely identification and resolution of conflicts of interests; strengthening control of corrupt practices; improving the selection of public office candidates; and prompt removal of inefficient employees from public and municipal offices.

High priority is given to measures such as improvement of the system of professional training; development of procedures for investigation of corrupt practices; and optimization of the system of labor remuneration and financial incentives for professional development and efficient work.

Corruption prevention measures are defined by provisions of the Presidential Decrees "On Commissions for Compliance with the Code of Conduct of Public Officials of the Russian Federation and Resolution of Conflicts of Interest" and "On the Urgent Measures Aimed at Removing Administrative Barriers to Entrepreneurship," as well as by the Standard Code of Ethics and Conduct of State Officials of the Russian Federation and Municipal Officials (approved by resolution of the Presidium of the Anticorruption Council under the President of the Russian Federation of 23 December 2010), which serves as basis for development by state agencies of the Russian Federation and bodies of local self-government of their respective codes of ethics and official conduct.

The constituent entities of the Russian Federation have established their own committees and adopted their own programs for combating corruption (in some regions, such programs are part of their administrative reform efforts). Special attention is paid to countering corruption in government procurement, staffing, banking, education, and healthcare.

Since 1 January 2018, Russia has had a law on putting in place a register of former public officials removed from office due to loss of confidence through violation of anticorruption legislation. This register is publicly available at: https://gossluzhba.gov.ru/reestr

One of the key anticorruption measures is the adoption of anticorruption strategies and programs by individual enterprises. Russian enterprises, primarily major oil & gas and energy sector companies, such as ROSNEFT, RUSSNEFT, ROSSETI, and EVRAZ, have engaged in adopting corporate policies for fighting corruption. In developing their anticorruption programs companies also rely on recommendations of international organizations, such as the World Economic Forum, Transparency International, and others. International experience shows that anticorruption programs of businesses are becoming an important management tool capable of improving business efficiency, minimizing corruption risks, and improving business security.

More generally, according to the Corruption Prevention and Countering Guidelines, approved by the Ministry of Labor and Social Protection of the Russian Federation 8 November 2013, anticorruption policies of an organization should comprise a complex of consistent principles, procedures, and activities designed to prevent, detect, and stop corruptive practices within the organization. Moreover, an anticorruption program should represent a significant portion of such policies comprising specific procedures and activities intended to prevent and stop corruption offences within the organization.

All in all, the anticorruption legislation of the Russian Federation has opened a new avenue in the development of social relations by setting uniform requirements to the institutions of the state, not-for-profit sector and businesses, including respect for law, high quality and availability of services, and openness and transparency. This trend – i.e., setting standard and uniform rules

for all – is key and shapes a new image of democracy where the state and its organs play a significant role but are not treated as privileged or indisputably credible – they are neither immune to regulation nor overregulated.

## Russia's Anticorruption System

Public authorities of the Russian Federation that are in charge of implementing the state policy in the field of countering corruption include the following:

- The President of the Russian Federation identifies key priorities of the anticorruption policy of the state and defines the scope of competence of subordinate executive authorities in the area of countering corruption. Acting under the President of the Russian Federation is the Council for Countering Corruption; the Presidential Administration also has the Office of the President of the Russian Federation on Anticorruption Issues.
- The Government of the Russian Federation assigns anticorruption functions to its subordinate executive authorities.
- The Federal Assembly (Parliament) of the Russian Federation, including the State Duma Security and Anticorruption Committee.
- Federal organs of executive power, and primarily the Ministry of Justice of the Russian Federation; the Federal Security Service of the Russian Federation; the Ministry of Labor and Social Protection of the Russian Federation; and the Ministry of the Interior of the Russian Federation. Playing an important role in coordination of anticorruption activities, the Ministry of Justice of the Russian Federation together with the Office of the Prosecutor General of the Russian Federation, federal executive authorities, research organizations, and civil society institutions prepares proposals concerning organizational and legal framework for monitoring of anticorruption law enforcement. Among other functions, the Ministry of Justice analyzes the existing practice of anticorruption review of laws and draft laws and accredits independent experts authorized to conduct anticorruption review of laws and draft laws.
- Organs of state power of constituent entities of the Russian Federation and organs of local self-government.
- The Office of the Prosecutor General of the Russian Federation. The Prosecutor General of the Russian Federation and subordinate prosecutors oversee the anticorruption activities of the Ministry of the Interior, Federal Security Service, Federal Customs Service, and other law enforcement agencies of the Russian Federation and exercise other anticorruption powers as per Russian law.
- The Accounts Chamber of the Russian Federation performs auditing, analytical, information, and other functions and carries out centralized control over execution of the federal budget and use of federal non-budgetary funds.
- Other bodies may be established by decision of the President of the Russian Federation to coordinate anticorruption activities.

On 3 September 2004, the National Anticorruption Council of the Russian Federation was established to perform studies and implement applied research projects included in the anticorruption programs of the Russian Federation (the National Anticorruption Council, an independent not-for-profit organization). On 19 April 2005, the Agency for Countering Corruption in the Russian Federation, and independent not-for-profit organization, was founded to provide the President of the Russian Federation, heads of federal authorities, state authorities of the constituent entities of the Russian Federation, and bodies of local self-government with civil support in improving state anticorruption policies, removing roots and causes of corruption, eradicating corrupt practices, stopping abuse of power, enforcing compliance by public servants with the existing standards of official conduct, and creating a favorable environment for the country's economic development.

Russia has a network of centers, institutes, and community councils focusing on the issues of

administrative reform, corruption, and shadow economy. Their key activities include sociological surveys, expert examination, training and education programs, pilot projects, etc. Researchers and experts are engaged to create multifunctional centers for provision of legal services, including introduction of project and result-based management, development of administrative regulations, drafting amendments to state and municipal service laws, etc.

One of the priorities is performing on a permanent basis anticorruption review of government decisions. Independent media, and investigative journalism, in particular, play an increasingly important role in fighting corruption. Investigations conducted by journalists help attain many ends, such as finding out corrupt officials; preventing corruption through revealing enablers of corruption offences; imposing pressure on public authorities in order to improve their transparency and accountability; and promoting public awareness of corruption and combating corruption.

Another important activity is creation of a network of centers providing free legal and social aid to citizens.

## Key Focus Areas in Combating Corruption

In Russia, corruption is considered as a result of excessive government intervention in the economy. At the same time, there is understanding that limiting such intervention will not eradicate corruption. Corruption will only change its forms and adapt to the conditions of self-regulating organizations and requirements of the business community. Therefore, to counter corruption a complex of measures is required going far beyond the public sector and public administration domain.

For experts in public administration, one of the priorities is monitoring of legislation in order to identify laws that may provoke corruption, both at the stage of law and managerial decision-making and at the stage of law enforcement.

One of the first drafts of the Concept of Administrative Reform (1998) proposed as one of the key approaches to combating corruption a "transition to all-out anticorruption efforts." Each and every transformation program was expected to have an anticorruption component comprising the following items: (a) reducing electoral consequences of corruption; (b) strengthening law-enforcement authorities; (c) adopting departmental anticorruption programs; (d) pushing anticorruption narrative; (e) taking proper legislative measures (passing new laws on lobbying, liability for legalization of criminal proceeds, forfeiting of assets and proceeds deriving from illegal transactions, state control over conformity between big consumer spending and declared income, reporting of income and property by top government officials and public servants, etc.).

At present, the Russian Federation prevents corruption through the following measures:

- Encouraging intolerance of society for corrupt behavior.
- Conducting anticorruption review of laws and draft laws.
- Examining law enforcement practices in order to design and take measures intended to prevent offences and eliminate their causes.
- Setting candidate qualifying requirements for state or municipal government positions and for public service jobs at the state or municipal level; checking the data provided by candidates.
- Using violations, such as failure to disclose details of income, expenses, assets and liabilities or disclosure of deliberately misleading or incomplete data as grounds for dismissal from a state or municipal office.
- Introducing personnel administration policies that favor long, flawless, and efficient performance by state and municipal officials of their duties and require that such performance always be taken into account for the purpose of promotion, appointment to a higher grade or rank, or otherwise award.
- Developing institutions of public and parliamentary control over compliance with anticorruption laws of the Russian Federation.

Key priorities for combating corruption in the Russian Federation are as follows:

1. Ensuring transparency of the organs of government, including regulation of their activities and ensuring their availability for public scrutiny.
2. Giving priority to the principle of declaration (not licensing, which means granting permission) in the regulation of business activities by the state bodies.
3. Simplifying the system of state control and oversight while making it more effective and efficient. More specifically, getting rid of duplication of various oversight functions (e.g., licensing, accreditation, and certification).
4. Improving the judicial system.
5. Enhancing the role of mass media in public control.
6. Anticorruption review of laws.
7. Special education programs.
8. Control of the income and expenses of public officials and politicians.

Key measures taken by the government authorities in order to increase the efficiency of their anticorruption efforts include the following:

1. Pursuing unified state policy in countering corruption.
2. Putting in place a mechanism for efficient interaction between law enforcement and other government authorities and public and parliamentary anticorruption commissions, citizens, and civil society institutions.
3. Taking legislative, administrative, and other measures to ensure deeper engagement of state and municipal officials as well as citizens in countering corruption and encourage within society a negative attitude toward corrupt behavior.
4. Improving the system and structure of government authorities while creating mechanisms of public control of their activities.
5. Introducing anticorruption standards, i.e., a system of prohibitions, restrictions, and permissions applying to a certain activity area and preventing corruption in this area.
6. Unifying the rights of public and municipal servants, government officials of the Russian Federation, government officials of constituent entities of the Russian Federation, heads of municipalities, and employees of municipalities as well as the duties of the said persons and the prohibitions and restrictions applying to them.
7. Enabling public access to information about the activities of federal authorities of the Russian Federation, government authorities of constituent entities of the Russian Federation, local self-governments, etc.

Russia continuously updates its key priorities at different stages of implementation of its national anticorruption plans. Thus, the activities of the National Plan for 2018–2020 are intended to achieve the following:

- Improving the system of anticorruption prohibitions, restrictions, and requirements, including restrictions on gifts for certain categories of public and municipal officials; developing criteria for classification of failure to comply with anticorruption prohibitions, restrictions and requirements as minor corruption offences entailing dismissal from office, etc.
- Improving the efficiency of the mechanisms intended to prevent and resolve conflicts of interests, e.g., through updating the application form for government, public, and municipal office candidates, namely, its section concerning the spouses of the applicant's brothers and sisters and the brothers and sisters of the applicant's spouse, in order to identify potential conflicts of interests.
- Improving anticorruption measures in the area of government and municipal procurement of goods, works, and services.

The current anticorruption plan proceeds from the necessity to expand the list of property of public officials liable to confiscation if there is proof that such property was obtained illegally or in violation of Russia's anticorruption law.

The document also specifies measures of countering corrupt behavior in the area of education and research.

## International Evaluation of Russia's Anticorruption Efforts

The Russian Federation has undergone four rounds of evaluation by the Group of States against Corruption (GRECO): the Joint First and Second Evaluation Round in 2008, the Third Evaluation Round in 2012, and the Fourth Evaluation Round in 2017.

The first two evaluation rounds were devoted to the various aspects of work of anticorruption agencies, grounds for granting immunity from prosecution to some categories of public officials, identification and confiscation of corruption proceeds, and other issues.

In December 2010, GRECO approved the report of the Russian Federation on compliance with the recommendations of this international organization. Of the 26 recommendations given to Russia, 9 were found fully implemented, 15 partly implemented, and 2 not implemented. Speaking about those not implemented, one should pay special attention to the recommendation to introduce to the legal system of Russia the institution of criminal liability of legal persons.

Although the Council of Europe Criminal Law Convention on Corruption recommends to introduce liability of legal persons, the participating states are free to select specific types of liabilities at their discretion. Russian experts in anticorruption law engaged in a debate concerning the possibility of introduction of such a measure, so unusual for Russia's legal system, and found the institution of criminal liability of legal persons being contrary to the principles of Russian law. The legislation of the Russian Federation only provides for public, financial, and administrative liability of legal entities.

In 2013, after the Third Evaluation Round, which covered two themes, namely, "Incriminations" and "Transparency of Party Funding," GRECO published a comprehensive report, in which all recommendations are split into two categories: "dealt with in a satisfactory manner" and "partly implemented." The report concludes that, of the 26 obligations undertaken by Russia, the country dealt with 15 in a satisfactory manner, while 11 recommendations were "partly implemented." It is noted that, in the past 18 months, the Russian Federation achieved significant results – the country has adopted 14 Federal Laws on combating corruption and 750 other regulations, including 11 Presidential Decrees. It is also noted as a positive anticorruption factor that Russia has centralized the function of prosecution for corruption offences by vesting it in the Investigation Committee of the Russian Federation.

The Fourth Evaluation Report is devoted to corruption prevention in respect of members of parliament, judges, and prosecutors and covers 22 recommendations. Based on the results of the Fourth Evaluation Round, GRECO recommended, among other things, that the Russian Federation increase the transparency of its legislative process, adopt a code of ethics for parliament members and develop anticorruption guidelines. In addition, the experts insisted on strengthening the system of declaration by the members of both chambers of the Russian parliament of their incomes, as well as on publication of verifiable information about the incomes of members of the State Duma and senators.

At the same time, the Russian Federation is still highly dissatisfied with its corruption rating – e.g., in 2019, Russia's score in Transparency International Corruption Perception Index (CPI) was 28 out of 100, and it ranked 137th among 180 countries (https://www.transparency.org/news/feature/cpi_2019_global_highlights). In 2018, the country's "control of corruption" score in the WorldWide Governance Indicators (WGI-2018) was 21.15 out of 100, which placed it on the second position in the second hundred of countries (https://data.worldbank.org/data-catalog/worldwide-governance-indicators).

Although the Russian Federation still rates pretty modest in international corruption indices, there are visible positive trends. The country sees less illegal business activities, the number of hostile business takeovers is shrinking, and the

law-enforcement system is becoming increasingly effective and efficient, especially in protecting public resources, private businesses, and property of individuals. Russia's anticorruption legislation is brought in line with international standards, proper anticorruption laws and by-laws are adopted along with an anticorruption strategy of the state, the practice of fighting corruption based on national 2-year plans is introduced, mechanisms are put in place to help counter corruption in public service and enforce ethical requirements set for public servants, etc.

## Conclusion

Russia has put in place a broad legal framework designed to counter corruption and encourage ethical behavior of public servants. The country ratified key international treaties on combating corruption and adopted fundamental anticorruption laws.

However, the existence of proper legal and institutional infrastructure per se does not warrant fast eradication of corruption. The future of anticorruption policy depends on the transparency (openness) of administrative decision-making processes and government procurement practices as well as on control over the conformity between incomes and spending of public servants.

To improve Russia's anticorruption policies, a broad range of measures needs to be implemented in the sphere of public administration, as well as in the public and private sectors of the economy. In the context of top-down power structure, anticorruption measures are taken at all levels of public relations: (a) the national (federal) level; (b) the level of constituent entities of the Russian Federation; (c) and the municipal/local self-government level.

Success of anticorruption policy does not only depend on the efficiency of special anticorruption measures, but also on how well they are integrated with more general mechanisms employed to improve the quality of organizational and functional foundations of public authority (Lafitsky 2019, p. 106).

# Russian Federation, System of Public Administration

Igor Bartsits
Institute of Public Administration and Civil Services, Russian Presidential Academy of National Economy and Public Administration, Moscow, Russian Federation

## Synonyms

Political System; Power of the State; System of Government; System of Public Authority

## Definition

**A System of Government** is the totality of government institutions that, acting on behalf of the state and relying on their authority, organize and regulate the life of society in order to streamline it and ensure its development. In a broader sense, government is understood as activities of the government and local self-government bodies, community-based and other government and nongovernment

organizations authorized to exercise powers of authority. Any activities related to public administration are based on laws and regulations. Broadly speaking, all state organs (legislative, representative, executive and judicial) are engaged in public administration in various forms. Key functions of the system of government include goal setting and planning, execution management, coordination and motivation of executing agents, and accounting and supervision of execution.

## Introduction

Reflecting the character and level of political, social, and cultural development of society and its administrative culture, the system of public and municipal administration of the Russian Federation is determined by a number of factors, such as: historical background and geography; economic situation and culture of society; political traditions; influence of globalization processes; and rapid development of information and communication technology.

The political system of Russia, its republican form of government and federal structure are entrenched in its basic law – i.e., the Constitution of the Russian Federation adopted by way of nationwide voting 12 December 1993. According to the Constitution, the political system of Russia is based on the following fundamental principles: rule of the people; national sovereignty; republican form of government; federal structure; division of powers; social, law-bound, secularity of the state; protection of human rights and liberties; local self-government; multiplicity of parties; ideological and political pluralism; rule of law; and diversity of forms of property.

The Russian Federation comprises 85 constituent entities (subjects), including 46 oblasts (regions), 22 republics, 9 krais (territories), 3 federal cities, 4 autonomous districts, and 1 autonomous oblast. At the intermediate administrative level, there are eight federal districts: Central, Northwestern, Southern, North Caucasian, Volga, Urals, Siberian, and Far Eastern. The federal districts were established as macro-regions of Russia in May 2000.

## Division of Powers

The Constitution of the Russian Federation of 1993 says, "The state power in the Russian Federation shall be exercised on the basis of its division into legislative, executive and judicial power. The bodies of legislative, executive and judicial power shall be independent" (Article 10). Article 11 of the Constitution lists all those who exercise state power in the Russian Federation: the President of the Russian Federation, the Federal Assembly (the Council of Federation and the State Duma), the Government of the Russian Federation, and the courts of the Russian Federation. Altogether, these bodies serve as the constitutional foundation of the Russian State (Table 1).

**The Head of the Russian State is the President of the Russian Federation**. The President of the RF is elected for 6 years by citizens of the Russian Federation on the basis of universal, equal, and direct suffrage by secret ballot. In the capacity of the Head of the State the President interacts directly with organs of legislative, executive and judicial power in the execution of their authority. The President of the RF is a backbone of the system of executive power. According to Part 2, Article 80 of the Constitution of the RF, the President of the Russian Federation is guarantor of the Constitution of the Russian Federation, of the rights and freedoms of man and citizen. The President ensures coordinated functioning and interaction of all the bodies of state power and defines key focus areas of Russia's foreign and domestic policy. To this end, the President, on an annual basis, delivers Presidential Address to the Federal Assembly of the Russian Federation.

The office of the President of the Russian Federation (President of the RSFSR) was established by the Supreme Soviet of the RSFSR 24 April 1991 based on the results of the All-Russian referendum that took place on 17 March 1991. Boris Yeltsin, the first President of the RSFSR, was elected for a 5-year term on 12 June 1991. In 1996, after the second round of voting, Boris Yeltsin was reelected for his second term. On 31 December 1999, Boris Yeltsin resigned, and Vladimir Putin, Chairman of the Government of Russia, became acting President of the Russian Federation.

**Russian Federation, System of Public Administration, Table 1** System of Government of the Russian Federation

Vladimir Putin was elected President of the Russian Federation on 26 March 2000 (by 52.99% of votes) and then reelected on 14 March 2004 (by 71.31% of votes). Because the Constitution sets a limit of two presidential terms in a row, Vladimir Putin did not run for presidency in 2008, and on 2 March 2008 Dmitri Medvedev was elected President with 70.28% of votes. Vladimir Putin was elected President of the Russian Federation on 4 March 2012 (63.60% of votes) and then reelected on 18 March 2018 (76.69% of votes).

In the period between 1991 and 1993, the role of the President of Russia was defined as that of the top leader and head of the executive branch of power. In that period, the Constitution provided for the following:

- The President was elected for a 5-year term.
- The President had the right to appoint the Chairperson of the Government, and also to dismiss the Government by agreement with the Supreme Soviet of the RSFSR.
- The President did not have the right to dismiss the Congress of People's Deputies or the Supreme Soviet of the RSFSR, or to suspend them.

The supreme organ of state power in that period was the Congress of People's Deputies of the RSFSR authorized to:

- Define domestic and foreign policy
- Adopt and amend the Constitution
- Change the national political system
- Elect members of the Constitutional Court of the RSFSR
- Repeal any presidential decree.

According to the Constitution of Russia of 1993, the President is the head of the state elected for a 4-year term and guarantor of the Constitution, of the rights and freedoms of man and citizen. The President holds a special place in the system of government and is not part of any branch of power.

The President has the right to define domestic and foreign policy; has discretion to dismiss the Government (to appoint the Chairperson of the Government, an agreement of the parliament is still needed); presents to the State Duma a candidate for the appointment to the position of the Chairperson of the Central Bank of the Russian Federation; and presents to the Federation Council candidates for judges of the Constitutional Court.

In the period between 2008 and 2014, the Constitution of the Russian Federation was amended as follows:

- The presidential term was increased to 6 years (effective from 2012 elections).
- The President obtained the right to appoint up to 10% (17 people) of the members of the Federation Council of the Russian Federation and to present to the Federation Council of the Federal Assembly candidates for judges of the Supreme Court, as well as candidates for the Prosecutor-General and deputies of the Prosecutor-General.

The constitutional reform of 2020 vested the President of the Russian Federation with the authority to:

- Form the State Council intended to ensure "coordinated functioning of the bodies of state power," define key directions of domestic and foreign policy, as well as articulate social and economic policy
- Perform general guidance of the cabinet of ministers and act as chair at the sessions of the Government
- Appoint and dismiss deputies of the Chairperson of the Government of the Russian Federation and federal ministers approved by the State Duma
- Appoint, upon consultations with the Federation Council, and dismiss heads of federal executive bodies (including federal ministers) in charge of the matters of defense, national security, internal affairs, justice, foreign affairs, emergency management, and public safety
- Submit to the Federation Council proposals to dismiss, in accordance with the Constitution, judges of the Constitutional Court of the Russian Federation, judges of the Supreme Court of the Russian Federation, and judges of courts of cassation and courts of appeal, should a judge commit misconduct discrediting their honor and dignity as well as in any other cases, as per federal constitutional law, incompatible with the capacity of a judge, etc.

The Presidential Executive Office of the Russian Federation is an executive body that supports the President of the Russian Federation and enables exercise by the President of the Russian Federation of constitutional powers. The Presidential Executive Office of the Russian Federation also supports the State Council and other councils and commissions under the President of the Russian Federation.

An important competency and authority of the Presidential Executive Office is enabling legislative activities of the President of the Russian Federation. It is known that, in pursuance of presidential authority, the President of the RF issues decrees and orders (Article 90, Constitution of the RF). Besides, the President has the right to submit bills (Article 84). Preparation of these documents, and their verification and submission to the Federal Assembly is one of the most important duties of the Presidential Executive Office.

According to Article 83 (g) of the Constitution of the Russian Federation, the President of the RF forms and acts as the head of the Security Council, an advisory body under the President of the RF comprising standing members and members appointed by the President of the Russian Federation. Standing members of the Security Council are the Chairperson of the Government of the Russian Federation and the Secretary of the Security Council. Besides, standing members may be the Minister of Defense, the Minister of Foreign Affairs, and the Director of the Federal Security Service of the RF. In the recent years, the Security Council has also had as its members the Chairperson of the State Duma and the Chairperson of the Federation Council of the Federal Assembly of the RF, and Presidential Plenipotentiary Envoys to Federal Districts of the Russian Federation. The Security Council prepares decisions of the

President of the Russian Federation in the field of national security.

**The legislative branch of the Russian Federation** includes the Federal Assembly of the Russian Federation, which consists of two chambers – the Council of Federation of the Federal Assembly of the RF and the State Duma of the Federal Assembly of the RF. These chambers differ in terms of status, scope of authority, and method of forming. It also includes legislative bodies of the constituent entities of the Russian Federation.

A member of the Council of Federation represents a legislative (representative) or executive body of a constituent entity of the Russian Federation and is vested with authority for a term equaling the term of his/her authority in the respective body of the constituent entity of the Russian Federation.

The Constitution of the Russian Federation delimits jurisdictions of the chambers of the Federal Assembly of the RF and assigns to the Council of Federation and the State Duma clearly defined matters.

According to Article 102 of the Constitution of the Russian Federation, the jurisdiction of the Council of Federation includes the following: approval of changes in borders between subjects of the Russian Federation; approval of the decrees of the President of the Russian Federation on the introduction of a martial law or state of emergency; deciding on the possibility of using the Armed Forces of the Russian Federation outside of the territory of the Russian Federation; appointment of elections of the President of the Russian Federation; impeachment of the President of the Russian Federation; appointment of judges of the Constitutional Court of the Russian Federation and of the Supreme Court of the Russian Federation; appointment and dismissal of the Prosecutor-General of the Russian Federation and deputies of the Prosecutor-General of the Russian Federation; appointment and dismissal of the Deputy Chairperson and half of the auditors of the Accounting Chamber. The Council of Federation adopts resolutions on the issues referred to its authority.

Since the adoption of the Constitution of the Russian Federation, the procedure of forming the Council of Federation has been changed several times. According to the initial procedure (1994–1996), members of the Council were elected from dual-member constituencies for a 2-year term. The next version of the procedure (from January 1996 to December 2001) provided for granting membership of the Council of Federation to the heads of executive and legislative organs of constituent entities of the Russian Federation. Moreover, the members of the Council performed their duties on a part-time basis and only met for regular sessions of their respective committees and commissions. At the next, third stage (from January 2002 to December 2012), instead of governors and heads of legislative bodies, members of the Council of Federation were appointed representatives working professionally on a full-time basis (one of them was appointed by the governor and the other one by the legislative body of the region). This procedure deprived the heads of regional executive and legislative authorities of their parliamentary immunity. Since December 2012, pursuant to Federal Law №229-FZ of 03 December 2012 "On the Procedure for Formation of the Council of Federation of the Federal Assembly of the Russian Federation," only a deputy who is a representative of the legislative (representative) body of the state authorities of a constituent entity of the Russian Federation may be nominated candidate for the conferral of the powers of a member of the Federation Council. Candidates are nominated by the Chairperson, faction, or group of deputies. The decision is taken by simple majority of votes. Representatives of regional executive authorities are elected in accordance with the following procedure: in the course of election of a representative from a constituent entity, each candidate submits a list of three nominees the first of whom, should the candidate be elected, will be granted the powers of a member of the Council of Federation (the second one on the list will have a chance to become a senator if the first one is dismissed prematurely, and the third one will have this chance, if the second one is dismissed prematurely). The decision to confer powers is made by the new elected highest official of the respective constituent entity of the Russian

Federation on the next day after his/her inauguration. Neither the governor nor the legislative body of a region may recall a senator before time. Grounds for early termination of powers of a member of the Council of Federation are the same as for a deputy of the State Duma.

According to the 2020 amendments to the Constitution of the Russian Federation, the Council of Federation consists of two representative from each constituent entity of the Russian Federation – i.e., one from the legislative (representative) organ and one from the executive authority, respectively; representatives of the Russian Federation appointed by the President of the Russian Federation – their share may not exceed ten present of the total number of members of the Council of Federation (Russian Federation senators) representing legislative (representative) and executive organs of constituent entities of the Russian Federation.

According to Par. 3, Article 95 of the Constitution of the Russian Federation of 1993, **the State Duma of the Federal Assembly of the Russian Federation** consists of 450 deputies. The State Duma has deputies' associations – factions and groups.

The key focus area of the State Duma of the Russian Federation is adopting federal constitutional and federal laws and laws on amendments to the Constitution of the Russian Federation. To this end, the State Duma establishes deputies' committees (e.g., for economic policy, agriculture, geopolitical issues, etc.), the credentials commission to count secret votes, verify data on events and officials' credentials, and other commissions for in-depth consideration of various issues; it also performs detailed review of bills within the scope of competency of its specialist units. The headcount of each committee is decided by the State Duma, but it cannot be less than 12 or more than 35 chamber deputies.

The electoral procedure for the State Duma candidates is defined by the Federal Laws "On Election of Deputies of the State Duma of the Federal Assembly of the Russian Federation," "On Fundamental Guarantees of Electoral Rights and the Right of Citizens of the Russian Federation to Take Part in Referendums," and some other federal laws. These laws establish the principle of election of deputies by citizens of the Russian Federation on the basis of universal equal and direct suffrage right by way of secret ballot. Participation of Russian Federation citizens in elections is free and voluntary.

Since 1993, the Law on Election of the Deputies of the State Duma has been amended several times. Each new version of the Law introduced changes to the electoral procedure that changed the role of political parties; the procedure for nomination of candidates; the shares of deputies elected on the first-past-the-post (FPTP) and proportional vote basis; and the election threshold for the proportional vote elections (Table 2).

In addition to its key legislative function, the State Duma has the right to make decisions on other matters in its jurisdiction as per the Constitution of the Russian Federation, including appointing and dismissing the Chairperson of the Central Bank of the Russian Federation; appointing and dismissing the Human Rights Commissioner of the Russian Federation, and the Chairperson and one half of the auditors of the Accounting Chamber of the Russian Federation; giving consent to the appointment of the Chairperson of the Government of the Russian Federation by the President of the Russian Federation

**Russian Federation, System of Public Administration, Table 2** The State Duma convocations

| Convocation | Term | FPTP seats | Proportional vote seats | Election threshold |
|---|---|---|---|---|
| 1st State Duma 12.12.1993 | 2 years | 225 | 225 | 5% |
| 2nd State Duma 12.12.1993 | 4 years | 225 | 225 | 5% |
| 3rd State Duma 19.12.1999 | 4 years | 225 | 225 | 5% |
| 4th State Duma 7.12.2003 | 4 years | 225 | 225 | 5% |
| 5th State Duma 2.12.2007 | 4 years | 0 | 450 | 7% |
| 6th State Duma 4.12.2011 | 5 years | 0 | 450 | 7% |
| 7th State Duma 18.09.2016 | 5 years | 225 | 225 | 5% |

and deciding the issue of confidence in the Government of the Russian Federation; proclaiming amnesty; advancing of charges against the President of the Russian Federation for his impeachment, etc.

The amendments to the Constitution of the Russian Federation made by way of popular vote of 1 July 2020 extend the jurisdiction of the State Duma authorizing it to:

- Hold consultations on presidential nominees for heads of federal executive organs (including federal ministers) dealing with matters of defense, national security, domestic affairs, justice, foreign affairs, emergency management, and public safety.
- Dismiss, on a submission from the President of the Russian Federation and in accordance with the Constitution, judges of the Constitutional Court of the Russian Federation, judges of the Supreme Court of the Russian Federation, and judges of courts of cassation and courts of appeal, should a judge commit misconduct discrediting their honor and dignity, as well as in any other cases, as per federal constitutional law, incompatible with the capacity of a judge, etc.

## Structure of the Executive Branch

In the past decades, the structure of executive authorities of the Russian Federation has undergone significant changes and transformations and may appear to have been finalized. However, it would be a mistake to say so, because some elements intrinsic to the executive branch of power continuously change trying to adequately respond to the challenges normally faced by the government machinery. Having learnt from international best practices, the executive authority of the Russian Federation developed numerous Russia-specific features that can be explained by the period of transition in the establishment of new Russia and by its federal structure.

In the mechanism controlling the executive branch of power, a special role belongs to the President of the Russian Federation who, not being part of any of the branches, exercises significant authority in relation to all of them. Moreover, most of it is the authority over the executive branch.

One of the most significant 2020 amendments to the Constitution of the Russian Federation provides that the President of the Russian Federation exercises general oversight over the Government of the Russian Federation (Par. 1, Article 110).

Legal foundations for interaction between the President of the Russian Federation and the executive authorities are entrenched in Chapters 4 and 6 of the Constitution of the Russian Federation and in Federal Constitutional Law № 4-FKZ "On the Government of the Russian Federation" of 6 November 2020. The Federal Constitutional Law specifies the right of the President to act as a chairperson at sessions of the Government and its Presidium, explains how the President carries out leadership in relation to certain federal executive authorities (primarily those of the "security wing"), and deals with matters such as reversal by the President of Government resolutions, temporary performance of presidential functions by the Chairperson of the Government, dismissal and resignation of the Government.

Prior to constitutional amendments of 2020, the President of the Russian Federation had the right to form the Government of the Russian Federation but with one provision: the nominee for Chairperson of the Government required approval by the State Duma. The other members of the Government were appointed at sole discretion of the President of the Russian Federation, although the Constitution of the Russian Federation obliged the Chairperson of the Government of the Russian Federation to nominate candidates for deputy chairpersons and federal ministers, and to propose the system and structure of federal executive authorities. The constitutional amendments of 2020 introduced significant changes to this procedure.

In addition to constitutional mechanisms of presidential control over the Government, new forms of interaction were introduced into the practice of governance. Thus, Article 83 (b) grants the President the right to chair the sessions of the Government. However, the President only enjoys this right in exceptional cases. Normally, the President holds meetings with members of the Government at which the Chairperson and all deputies

are present, as well as federal ministers who are invited on an as-needed basis depending on the topic of the meeting.

It is one of the key features of the administrative and legal framework of functioning of the federal executive authorities in the Russian Federation that no federal law concerning the bodies of executive power of the Russian Federation" has ever been adopted and the system and structure of such organs is defined by executive regulations issued by the President of the Russian Federation. This peculiarity is entrenched in the constitutional amendments of 2020.

According to Article 110 of the Constitution of the RF, the executive power in Russia is exercised by the Government of the Russian Federation (After the dismantling of the USSR, President B.N. Yeltsin directly headed the Government of the RSFSR. From 15 March 1992 to 15 December 1992, Y.T. Gaidar was Acting Chairperson of the Government. After him, the office of the Chairperson of the Government was held by V.S. Chernomyrdin (from 14 December 1992 to 23 March 1998), S.V. Kirienko (from 24 April to 23 August 1998), V.S. Chernomyrdin (August–September 1998), E.M. Primakov (from 11 September 1998 to 12 May 1999), S.V. Stepashin (from 19 May to 9 August 1999), V.V. Putin (from 16 August 1999 to 7 May 2000), M.M. Kasianov (from 17 May 2000 to 24 February 2004), M.E. Fradkov (from 5 March 2004 to 12 September 2007) V.A. Zubkov (from 14 September 2007 to 7 May 2008), V.V. Putin (from 8 May 2008 to 7 May 2012), D.A. Medvedev (from 8 May 2012 to 15 January 2020), and M.V. Mishustin (from 16 January 2020).). The Government of the RF is a federal executive body with general competence covering areas such as economic development, social and cultural activities, administrative and political issues, and law enforcement. As a collective executive, the Government of the Russian Federation consists of the Chairperson of the Government of the Russian Federation, Deputy Chairperson of the Government of the Russian Federation, and federal ministers (Par. 2, Article 110 of the Constitution of the RF).

The legal status and procedures of the Government of the Russian Federation are governed by Chapter 6 of the Constitution of the Russian Federation, Federal Constitutional Law № 4-FKZ of 6 November 2020 "On the Government of the Russian Federation," federal laws and numerous bylaws of which particularly important are the decrees and orders of the President of the Russian Federation, orders and other acts of the Government of the Russian Federation and other federal executive organs.

Since the adoption of the previous version of the Federal Constitutional Law in 1997, numerous amendments to it have been passed, which provide for the following:

- In the context of anticorruption measures, changes were made in Article 10 obliging not only members of the Government of the Russian Federation but also their spouses and minor children to declare their property and income (2008).
- The procedure and timeline for submission by the Government of the Russian Federation of the federal budget and budget execution report to the State Duma of the RF were changed (2010).
- The chambers of the Federal Assembly of the Russian Federation have the right to summon members of the Government of the Russian Federation to their sessions to provide information on issues of high priority (2013).
- The Government must submit to the chambers of the Federal Assembly of the Russian Federation information about progress and tentative timelines of issuing regulations, which must be developed and adopted according to federal law (2013).
- The Government has the right to establish government commissions to investigate causes of emergency situations and manage such emergency situations (2013).
- Members of the Government are banned from opening accounts (making deposits), holding cash or valuable assets in foreign banks located outside of the Russian Federation, hold and/or use foreign financial instruments (2013).
- Members of the Government of the Russian Federation are bound with additional obligations intended to prevent and resolve conflicts of interests (2015).

– Decisions can be made without convening meetings (2016).

Federal Constitutional Law "On the Government of the Russian Federation" of 6 November 2020 sets a new procedure for formation of the Government, which takes into account the constitutional amendments of 4 July 2020. All in all, the Federal Constitutional Law "On the Government of the Russian Federation" reflects these constitutional novelties; however, it has clarifying provisions intended to rule out divergent interpretation. For example, while Article 110 of the Constitution says that "the executive power in Russia shall be exercised by the Government of the Russian Federation," the corresponding article of Federal Constitutional Law FKZ № 4 of 6 November 2020 amplifies, "The executive power in the Russian Federation shall be exercised by the Government of the Russian Federation and other federal executive organs according to the structure of federal executive authority and under general oversight of the President of the Russian Federation, as well as executive organs of constituent entities of the Russian Federation."

The appointment procedure for the Chairperson of the Government was changed: the President can only appoint the Chairperson after the approval of the nominee by the State Duma. Previously, it was enough to get deputies' agreement. If the State Duma declines the nominee thrice, the appointment can be made at President's discretion.

The appointment procedure for members of the Government was also changed: the President appoints security-wing ministers upon consultations with the Council of Federation; the other ministers are appointed by the State Duma on the nomination of the Chairperson of the Government. Candidates for Chairperson's deputies and ministers can be nominated three times. Should the State Duma decline them thrice, the appointment can be made at President's discretion.

Another important novelty is that dismissal of the Chairperson of the Government does not automatically entail resignation of the Government. The President can replace the Chairperson while keeping the cabinet members. The structure of the Government is defined by the head of state, as before.

As to the system of federal executive authorities, in 1993–2000, the model of administration was based on a permissive approach to defining their types and structure exemplified by Decrees of the President of the Russian Federation "On the Structure of Federal Bodies of Executive Power" № 66 of 10 January 1994, № 1176 and № 1177 of 14 August 1996, and № 867 of 17 May 2000. These documents did not define any types of executive organs, and, when a specific system of executive authorities was formed, both composition and types of ministries and agencies were decided based on a very light touch. For example, The Decrees of the President of 14 August 1996 (Decree № 1176 "On the System of Federal Bodies of Executive Power" and Decree № 1177 "On the Structure of Federal Bodies of Executive Power") say that the system of federal executive authorities comprises ministries of the Russian Federation (federal ministries) and other federal organs of executive power. The latter could be state committees, federal services, Russian agencies, federal inspectorates, and other types of executive bodies.

Decree of the President of the Russian Federation № 314 of 2004 "On the System and Structure of Federal Bodies of Executive Power" was an important milestone in the development of the system of executive authorities of Russia. This Decree clearly defined three types of executive organs: (1) federal ministries; (2) federal agencies; and (3) federal services.

Federal ministries develop state policies for their respective areas of responsibility and regulate these areas, coordinate and control their subordinate federal services and federal agencies, and coordinate public non-budgetary funds.

Federal services control and oversee their respective areas of responsibility and perform special functions in the sphere of defense, national security, national border control, crime prevention, and public safety.

Federal agencies provide public services, manage public property, and enforce the law.

Later, the Government of the Russian Federation approved provisions on federal executive

bodies and passed resolutions on functioning of new and reorganized federal executive authorities, as well as on the headcount of their deputy heads and numbers of their structural units. However, these changes are not final, and the process of reorganization continues.

The composition of the Government of the Russian Federation also has some peculiar features. Thus, the initial concept of administrative reform entrenched in the very first version of Decree № 314 provided that the Chairperson of the Government can only have one deputy (Par. 8). This model of plural executive was intended to strengthen personal responsibility and significance of federal ministers. However, over time, the number of deputies of the Chairperson of the Government increased: from one in 2004 to three in 2005, five in 2007, eight in 2008, and nine in 2020. Currently, each deputy is in charge of a certain number of public administration issues and controls federal executive authorities responsible for those issues.

Another peculiarity of the Government of the Russian Federation is the "dual subordination" of some ministers who report to both the Chairperson of the Government as the one who heads the Government, identifies its key focus areas and allocates duties to Government members (Article 24 of Federal Constitutional Law № 2-FKZ of 17 December 1997) and the President of the Russian Federation as the one who, pursuant to Article 32, leads the "security wing" of the federal executive branch and provides guidance to the organs that are part of this branch, both directly and through federal ministers.

Quite notable are the powers of the Chairperson of the Government in making staffing decisions. Thus, in the process of forming the Government of the Russian Federation the Chairperson of the Government can present nominees to the President, as well as propose dismissal of existing Government members. However, the Chairperson does not have discretion to dismiss members of the Government. It is worth adding that, from the checks and balances perspective and in the context of interaction between the executive and legislative branches, the State Duma does not have the right to directly change the composition of the Government once it has been formed. The State Duma can pass a no-confidence motion against the Government or summon any member of the Government to deliver report, but only the President of the Russian Federation has the right to dismiss the Government or a member of the Government.

It may be quite interesting to compare the number of federal executive bodies at the initial stage of the new system of executive authority and today. Thus, in accordance with Decree of the President of the Russian Federation № 1177 of 14 August 1996 "On the Structure of Federal Bodies of Executive Power," there were 24 ministries, 19 state committees, 18 federal services, 3 Russian agencies, and 2 federal inspectorates – in total 67 federal executive organs including the Government. Currently, according to Decree of the President of the Russian Federation № 21 of 21 January 2020 "On the Structure of Federal Bodies of Executive Power," there are 21 federal ministries, 30 federal services, and 21 federal agencies – in total 72 federal organs of executive power. Moreover, recently, this number shrank even more in the context of optimization of the public administration system amid a difficult financial and economic situation.

No less interesting is the change in the number of federal ministries: while in 1996 and 2020, there were 24 and 21 federal ministries, respectively, the first version of the abovementioned Decree № 314 of 2004 provided for having only 14 federal ministries – 5 in the "security wing" and 9 in the "social and economic wing." Therefore, it is in the context of the 2004 administrative reform that a serious attempt was made to optimize the administration apparatus. However, the subsequent developments in the sphere of public administration resulted in further increase in the number of both federal ministries and other federal organs of executive power.

One of the objectives of federal executive branch transformation was clearer allocation of the functions related to the development of state policy and legal regulation, delivery of public services, and state control and oversight to federal ministries, agencies, and services. However, with the issue of Decree of the President of the Russian

Federation № 1274 of 24 September 2007 "Questions of the Structure of Federal Bodies of Executive Power" the system based on three types of executive authorities was distorted: Par. 4 of the Decree provided for establishment of state committees, a type of federal executive body combining all the above functions. This undermined the logic of transformation of the system of executive power. In 2007, two state committees were established: "Rosrybolovstvo" (State Committee for Fishery) and "Rosmolodezh" (State Committee for Youth Affairs). However, after a short period of time, with the issue of the Decree of the President of the Russian Federation № 724 of 12 May 2008 "Questions of the System and Structure of Federal Bodies of Executive Power," both were transformed into federal agencies.

Creation of ministries on a "territorial" basis significantly contributed to increasing the number of federal ministries: Ministry of North Caucasus Affairs, Ministry for Development of Russian Far East, and Ministry of Crimea Affairs – this was yet another trend in the development of the structure of federal executive branch. All these ministries were established to concentrate public administration resources for the purpose of development of individual groups of Russian regions. Most likely, however, these ministries were designed as temporary and were expected to be disbanded upon achievement by their respective territories of a certain level of social and economic development. Of all "territorial" ministries, only the Ministry for Development of the Russian Far East has been kept. The other two were disbanded and their functions were transferred to the Ministry of Economic Development (Zanko 2016).

Analyzing the development trends and peculiarities of the system of federal executive power, one can conclude that it has been changing and transforming relatively fast, even though the Russian state in general is characterized by government continuity and high level of political stability.

It is deemed necessary to take measures to make the functions of executive authorities more complex and detailed, open the door for persistent and consistent shaping within the system of major "administration building blocks" in the form of modular units of federal ministries and agencies as well as for comprehensive approach to the tasks set by the Government. The reform of the ministries is based on the principles of "collective governance" where the ministers bear political responsibility for their respective areas and the scope of interministerial coordination is limited.

The constitutional amendments of 4 July 2020 provide for a large-scale revision of approaches to the arrangement of executive authorities and formation of the Government of the Russian Federation. Thus, they grant the President of Russia the right to carry out general guidance of the Government, approve and modify the structure of federal bodies of executive power proposed by the Chairperson of the Government; in the structure of federal executive authorities, identify those reporting to the President of the Russian Federation, and those subordinate to the Government of the Russian Federation. At the same time, should the President dismiss the Chairperson of the Government, the new Chairperson of the Government is not supposed to propose to the President a new structure of federal executive authorities. In a sense, the said constitutional amendments enshrine the existing practice of interaction between the President and the Government.

The constitutional amendments significantly modified the procedure of formation of the Government of the Russian Federation. From now on, the "security-wing" ministers will be appointed upon consultations with the Council of Federation, and the deputies of the Chairperson of the Government and the "socioeconomic-wing" ministers upon approval by the State Duma. The amended Constitution also provides a legal mechanism preventing any delays in the formation of the Government by setting timelines for approval by the State Duma of candidates for positions in the Government, as well as the allowed number of nomination rejections and the course of action in the event a significant number of nominations have been rejected.

**The judicial system of the Russian Federation** is instituted under the Constitution of the Russian System and Federal Constitutional Law № 1-FKZ of 31 December 1996 "On the Judicial System of the Russian Federation." Creation of

special courts is not allowed. All judges are independent and only subject to the Constitution and federal laws of the Russian Federation. Currently, the judicial system of Russia comprises general jurisdiction courts and courts-martial, courts of arbitration and constitutional (charter) courts. The system of federal courts includes general jurisdiction courts and courts of arbitration with the Supreme Court of the Russian Federation and Constitutional Court of the Russian Federation at the top. The court system of constituent entities of the Russian Federation also includes justice of the peace courts and constitutional (or charter) courts.

Table 3 shows key milestones in the development of the judicial system of Russia.

The constitutional amendments of 1 July 2020 grant the Council of Federation more powers to dismiss, on a submission from the President of the Russian Federation, judges of the Constitutional Court of the Russian Federation and judges of the Supreme Court of the Russian Federation, should a judge commit misconduct discrediting their honor and dignity, as well as in any other cases, as per federal constitutional law, incompatible with the capacity of a judge (Article 102 (k)). The number of judges of the Constitutional Court is reduced from 19 to 11. When required by the President of the Russian Federation, the Constitutional Court will test laws, both federal and regional, for constitutionality prior to their signature.

The Russian Federation has authorities (institutions and agencies) that are not part of any branch of power. These authorities include: the Office of the Prosecutor General of the RF, the Central Bank of the RF, the Accounts Chamber of the RF, the Central Elections Commission of the RF, the Human Rights Commissioner of Russia, etc.

**Russian Federation, System of Public Administration, Table 3** The Judicial branch of power in the Russian Federation

| Period | Characteristics |
|---|---|
| 1991–2001 | Concept of the judicial reform in the RSFSR:<br>Key laws are adopted defining the status of judges, the court procedure, and the structure of the court system |
| 2002–2006 | Federal Target Program "Development of the Judicial System of Russia in 2002–2006:<br>All types of courts provided by the law were established.<br>The procedural legislation was brought in line with the provisions of the Constitution of the RF<br>The procedural codes were adopted (the Criminal Procedural Code of the RF, the Civil Procedural Code of the RF, and the Arbitration Procedure Code of the RF)<br>Nisi prius courts were institutes<br>Justice of the peace courts were reinstituted |
| 2007–2013 | Federal Target Program "Development of the Judicial System of Russia in 2007–2012":<br>Multiple important federal laws designed to further improve the court procedure and court system were adopted |
| 2014–2018 | The Supreme Arbitration Court of the Russian Federation was excluded from the list of federal courts<br>The Supreme Court of the Russian Federation was vested with additional powers and became the only supreme judicial authority with jurisdiction over administrative, civil, criminal, and other cases as well as economic disputes |
| From 2019 to the present day | Reform of the system of general jurisdiction courts and changes in the rules of procedures:<br>Courts of appeal and courts of cassation were transformed into dedicated supraregional courts<br>Courts can have fully authorized permanent benches in locations other that their main facilities<br>The structure, territorial jurisdiction, and names of courts-martial were changed. The system of courts-martial was brought in line with the existing geography of military districts of the Russian Federation<br>"Total cassation" was introduced – i.e., each and every cassation appeal must be heard in a court of cassation by a panel of judges<br>The number of cases heard summarily was increased, including through increasing case values<br>Since 1 October 2019, individuals can file class action lawsuits to protect their rights and legitimate interests |

## The Management System of the Constituent Entities of the Russian Federation

For the government of Russia, managing a country located on two continents and inhabited by numerous ethnic groups has always been a difficult task. The effectiveness of governance has always depended on what powers and state function the central government will retain and what will be exercised by the regional authorities. In Russia, various models have been used to solve this problem. The federal principle in the Russian state is present due to the decentralization through the delineation of powers between the center and the regions.

The economic, ethnic, social, geographic, climatic, and other features of the regions of the Russian state have become the reason for the use of a complex, multilevel system of the state structure of the country, as well as a variety of methods for regulation of public relations in its regions.

For the Russian state, the characteristic of state-legal ties testify to the level of execution of the centralization of power, shows the relationship between the constituent entities of the federation, and reveals the issue of the delineation of powers between the federal government and the power of the constituent entities of the Russian Federation. In Russia, one of the main tasks in creating an effective system of state power is the regulation of relations between federal and regional governing bodies as well as the organization of executive power in the constituent entities of the Russian Federation. Delineation of powers is complex and an ongoing process.

Before the adoption of the Constitution of Russia in 1993, which enshrined the federal form of state structure, the Federal Treaty of 31 March 1992 was signed – an agreement on the delineation of powers between the bodies of state power of the Russian Federation and its constituent entities.

The Constitution of the Russian Federation of 1993 included the content of the Federal Treaty and replaced the contractual delimitation of powers with the constitutional; Article 76 stipulates that the further delineation of powers between the federal government and the authorities of the constituent entities of the Federation will be carried out by law.

After the Federal Treaty was signed, its text was included in the Constitution as an integral part of it, but in the text of the Constitution of the Russian Federation of 1993, it is mentioned only as one of the treaties regulating the delimitation of powers between the bodies of the state power of the Russian Federation and bodies of state power of its constituent entities (Part 3 of Article 11 of the Constitution of the Russian Federation). This clause makes it possible to conclude special bilateral agreements between the Russian Federation as a whole and some of its regions.

The Constitution of the Russian Federation provides for the possibility of concluding two types of agreements:

- Agreements between the Russian Federation and a constituent entity of the Russian Federation on the delimitation of jurisdiction and powers (part 3 of art. 11)
- Agreements between the executive authorities of the Russian Federation and the constituent entity of the Russian Federation on the transfer of part of the powers (Parts 2, 3, Article 78).

During the period between February 1994 and mid-1998, 42 agreements on the distribution of powers and subjects of jurisdiction were concluded with 46 constituent entities of the Russian Federation, after which this practice was stopped. Currently, they all have ceased to operate.

Prescribed in the Federal Treaty of 1992, and then in the Constitution of the Russian Federation of 1993, the distribution of powers is based on dividing all issues of public life into three groups:

- Subjects of jurisdiction of the Russian Federation;
- Subjects of joint jurisdiction of the Russian Federation and constituent entities of the Russian Federation;
- Subjects of the jurisdiction of a constituent entity of the Russian Federation.

The delimitation of powers is as follows: the Constitution defines the sphere of powers of the federal government and the sphere where the federation and its subjects are empowered; outside of these spheres, the constituent entities have full state power. Sometimes, through special agreements, the powers of the federation and its constituent entities can be redistributed, which, in turn, gives the system the necessary flexibility.

The federal structure of Russia is based on the fundamental principles of:

1. State integrity
2. Unity of the system of state power
3. Delimitation of the scope of authority between federal bodies of state power and bodies of state power of the constituent entities of the Federation
4. Equality and self-determination of the people

The establishment of general principles for organizing the system of state bodies of the constituent entities of the Russian Federation is attributed by the Constitution of the Russian Federation (clause "n," Part 1 of Article 72) to the joint jurisdiction of the Russian Federation and the constituent entities of the Russian Federation. Part 1 of Article 77 of the Constitution of the Russian Federation states the following: "The system of bodies of state authority of the republics, territories, regions, cities of federal importance, autonomous regions or autonomous areas shall be established by the constituent entities of the Russian Federation independently and according to the principles of the constitutional system of the Russian Federation and the general principles of the organization of representative and executive bodies of state authority established by federal law."

For the system of public administration of the Russian Federation, the differentiation between federal and public authorities of the constituent entities of the Russian Federation is of great practical importance. In Part 1 of Article 11 of the Constitution of the Russian Federation, the list of bodies exercising state power in the Russian Federation is exhaustive, then, concerning the bodies of state power of the constituent entities of the Russian Federation, Part 2 of the same article establishes only the general principle: "State power in the constituent entities of the Russian Federation shall be exercised by the bodies of state authority created by them."

However, until 19 October 1999, such a system was formed in the regions based on provisions enshrined in their own constitutions and statutes. With the adoption of the Federal Law of 6 October 1999, No. 184-FZ "On the general principles of organization of legislative (representative) and executive bodies of state power of the constituent entities of the Russian Federation" (hereinafter – FZ-184), the requirement of Article 72 of the Constitution of the Russian Federation, as well as the necessary conditions for creating and organizing activities of legislative and executive bodies in the regions were fulfilled.

According to Article 2 of the FZ-184 "the system of state power bodies of the constituent entity of the Russian Federation consists of: the legislative (representative) body of state power of the constituent entity of the Russian Federation; the supreme executive body of state power of a constituent entity of the Russian Federation; other government bodies of a constituent entity of the Russian Federation, formed according to the constitution (charter) of a constituent entity of the Russian Federation. The constitution (charter) of the constituent entity of the Russian Federation may establish the position of the highest official of the constituent entity of the Russian Federation."

In the federal state, the establishment of effective interconnections between federal state bodies and state bodies of the constituent entities of the Russian Federation is of particular importance. It is known that in the 1990s, the practical and legal support of such interaction was an intractable problem. In the absence of a unified system of state power, the relations of the federal bodies of state power with the bodies of state power of the constituent entities of the Russian Federation were characterized as a "war of laws," which often led to political confrontation between the federal center and regional political elites. Only after the administrative reform, the unity of the system of state power ("the vertical of power") was restored, and the necessary conditions for legal regulation

of the interconnection between the federal center and its constituent entities emerged.

A significant role in this process was played by the introduction of a new procedure for empowering the heads of the constituent entities of the Russian Federation – the highest officials of the regions, which led to new opportunities in the interaction between the Russian Federation and its constituent entities. The empowerment of the heads of the constituent entities of the Russian Federation by the President established a new format of interconnection with the regional leaders, thus adding not only mechanisms of accountability and responsibility but also mutual trust.

The legislative (representative) body of state power of the constituent entity of the Russian Federation is the only acting supreme body of legislative power of the constituent entity of the Russian Federation. Its name and structure are established by the constitution (charter) of the constituent entity of the Russian Federation, taking into account the historical, national, and other traditions of the constituent entity of the Russian Federation. The names of regional legislative bodies can vary, among them: legislative assemblies, regional dumas, state assemblies, state councils, khurals, and population assemblies.

In the constituent entity of the Russian Federation, a system of executive authorities is established with the dominant supreme executive body of state power of the constituent entity of the Russian Federation. The structure of the executive bodies of state power of the constituent entity of the Russian Federation is determined by the highest official of the constituent entity of the Russian Federation (the head of the highest executive body of state power of the constituent entity of the Russian Federation) following the constitution (charter) of the constituent entity of the Russian Federation.

According to Clause 3 of Article 18 of FZ-184, the highest official of the constituent entity of the Russian Federation (the head of the highest executive body of state power of the constituent entity of the Russian Federation) is elected by the citizens of the Russian Federation residing on the territory of this constituent entity of the Russian Federation and having active suffrage, based on universal equal, and direct suffrage by secret ballot. However, on 9 March 2016, Federal Law No. 66-FZ amended the Federal Law FZ-184. This way, Clause 3.2 of Article 18 also provides for the second way of electing the highest official of the constituent entity – by the deputies of the legislative (representative) body of state power of the constituent entity on the proposal of the President of the Russian Federation in accordance with the list of proposed candidates (party's lists of candidates must be allowed to distribute deputy mandates). Thus, the President of the Russian Federation submits to the legislative (representative) body of state power of the constituent entity of the Russian Federation a proposal on the candidacy of the highest official of the constituent entity of the Russian Federation from among the candidates presented by the political party, including those who are in the federal reserve of management personnel.

One of the organizational innovations during the Presidency of Putin V.V. was the creation of federal districts and the introduction of the Institution of Plenipotentiary Representatives of the President of Russia in the federal districts. For the Constitution of the Russian Federation, at the present stage of development of Russian statehood, this is a new mechanism for reforming the system of public administration and not a change in the state structure of the country or the territorial organization of state power. Since the "formation" of federal districts does not always take into account the historically established economic zoning of the country and the economic potential of the regions, the list and composition of federal districts have changed several times (Bartsits 2019).

The formation of the Institution of Plenipotentiary Representatives of the President of Russia caused several changes in the structure and methods of management of federal executive bodies on the level of federal districts. Thus, there was a kind of synchronization in some activities of the public administration system. In federal districts, the Institution of Plenipotentiary Representatives of the President of Russia has created prerequisites for effective interdepartmental coordination and for addressing urgent tasks that could be

solved best at the level of territorial communities that make up each federal district.

## Organization of Local Self-Government: Interaction of Public Authorities at Different Levels

The most important stage in the formation and organization of the public administration system was the adoption of the Law of USSR on 9 April 1990, No. 1417-I "On general principles of local self-government and local economy in the USSR." Initially, the law had only 27 articles, and it was difficult to imagine its significance; despite the brief text, the law not only proclaimed for the revival of local self-government but also restored the very concept of local self-government and determined the main direction of its activity – communal (municipal) property.

The legal status of local self-government was supplemented by the Law of the RSFSR on 6 July 1992, No. 1550-I "On local self-government in the Russian Federation." Its adoption was associated with the introduction of a specific provision into the existing Constitution of the RSFSR that local Councils are no longer included into the unified system of representative bodies of state power. However, attempts to gradually transform local Councils into local self-government bodies have not been successful. In September–October 1993, the President of the Russian Federation adopted decisions that led to the elimination of not only Soviet statehood but also the emerging elements of local self-government. Nonetheless, local Councils were not disbanded throughout the state.

Although the changes of 1990–1993 did not lead to the formation of a system of local self-government, they made it possible to change the approach to established practice and lay the legal basis for future municipal reform. In those years, there were many discussions about the fate of local self-government in Russia; it was at this time that the gradual formation of the Russian model of local self-government took place, which was enshrined in the constitutional act. The Constitution of the Russian Federation consolidated local self-government in Article 3 as a form of democracy, and in Article 12 – as the basis for the constitutional system. It included a whole chapter No. 8 on "Local self-government," as well as other constitutional provisions regulating the main issues of the local community:

- The right to municipal property, including land and other natural resources (articles 8, 9)
- The legal status of a citizen in the system of local self-government (Articles 18, 24, 32, 33, 40, 41, 43, 46). Art. 18 establishes that the rights and freedoms of man and citizen determine the activities of local self-government; Article 32 stipulates that all citizens of Russia are granted the right to elect and be elected to local self-government bodies, as well as to participate in a referendum; Article 33 states that citizens have the right to apply personally, as well as to send individual and collective appeals to local governments; Article 40, 41, and 43 determine the directions of activity of local governments in the field of housing construction, medical services, basic general, and secondary vocational education.

The issues on local self-government are mentioned in 19 articles of the Constitution of the Russian Federation and are norms of direct action, obligatory for application, including by the judicial authorities.

Article 12 of the Constitution of the Russian Federation establishes that local self-government is independent within the limits of its authority. However, the Constitution of the Russian Federation establishes only some of the administration subjects of local self-government. In Clause 1 of Article 132 of the Constitution of the Russian Federation, it is enshrined that local governments independently manage municipal property; form, adopt, and implement the local budgets; introduce local taxes and dues; ensure the protection of public order; and also resolve other issues of local importance.

The Constitution of the Russian Federation became the basis for the development of the Federal Law of 28 August 1995, No. 154-FZ "On

general principles of organization of local self-government in the Russian Federation"; after the adoption of this law, Russia joined several international acts. On 28 February 1996, Russia signed the European Charter of Local Self-Government, on 20 March 1998, it was ratified; thus, Russia has undertaken the obligations of the Charter to observe the principles of organizing local self-government. In 1992, in Strasbourg, the member states of the Council of Europe adopted the European Charter of Cities as a kind of code of "good" city governance, as well as the European Declaration of the Rights of Cities, which included all the basic rights, the observance of which should ensure the development of local self-government.

An important leap in the development of local self-government was the adoption of the Federal Law of 6 October 2003, No. 131-FZ "On general principles of organization of local self-government in the Russian Federation." The launch of a large-scale municipal reform in 2013 had a strong influence on the system of the local self-government; as a result of the reform, the organizational and legal foundations of local self-government were improved, the powers of local authorities were clarified, information and methodological support of the municipal reform were strengthened, specific issues of the organization and implementation of local self-government in the Russian Federation were improved, including state registration of the charters of municipalities, etc.

According to the amendments of 2017, the format of the work of local self-government bodies has changed. Now it is carried out through elected or other bodies of local self-government, which have separate state powers that are granted to them by federal or regional laws. Also, governors and deputies at all levels were empowered to change the status of urban districts, urban and rural settlements, bypassing the procedure of direct voting of the population.

In the Russian Federation, local self-government is exercised in the territories (municipalities), which are defined by law: urban, rural settlements; municipal areas; municipal districts, urban districts; urban districts with intracity division; intracity areas; and intracity territories of cities of federal importance.

Local self-government bodies and local self-government officials play a significant role in resolving issues of local importance. Local self-government is the representative body of the municipality, the head of the municipality, the local administration (executive and administrative body of the municipality), the control body of the municipality, other bodies and elected officials of local self-government provided for by the charter of the municipality and having their own powers to resolve issues of local importance.

The structure of local self-government bodies must necessarily include a representative body, the head of the municipality, and the local administration (executive and administrative body of the municipality); this does not apply to rural settlements, where the number of residents eligible to vote is less than 100 and the powers of a representative body are exercised by a gathering of citizens.

The procedure for the formation, powers, term of office, accountability, controllability of local self-government bodies, as well as other issues of the organization and activities of these bodies, are determined by the charter of the municipality. The names of the representative body of the municipal formation, the head of the municipal formation, the local administration (the executive and administrative body of the municipal formation) are established by the law of the constituent entity of the Russian Federation, taking into account historical and other local traditions.

The issues of local importance are resolved through the use of forms of direct implementation by the population of local self-government and forms of participation of the population in the implementation of local self-government. The economic basis of local self-government is constituted by the municipal property, funds from local budgets, as well as property rights of municipalities.

During the 30 years after the collapse of the USSR, we can see a complex, multistage process of formation of the organizational, economic, institutional, legal, and territorial foundations of Russian local self-government. In the 1990s, the country lost its territorial integrity, and now, a new, more effective territorial organization is

being created that does not contradict the federal foundations of the Russian state. On the contrary, the years of reforms have shown that the absence of a capable executive power cannot contribute to the development of federalism. The contradictions between the center and the regions, between the regions themselves, greatly hampered the economic revival, political stability, social guarantees for citizens, protection of human rights and freedoms (Bartsits 2019).

Understanding the above, it all defined the adoption of the amendments to the Constitution of Russia (2020), which state that "local self-government bodies and state authorities are part of the unified system of public authority in the Russian Federation and interact for the most effective resolving of problems in the interests of the population living in the relevant territory" (Clause 3 of Article 132).

## Constitutional Changes in the System of Governing Bodies

During the term of the Constitution, it was amended to provide for:

- Increasing the terms of office of the President to 6 years and the State Duma to 5 years (2008)
- The obligation of the Government to submit an annual report to the State Duma (2008)
- A merger of the Supreme Court and the Supreme Arbitration Court, exclusion of references to the Supreme Arbitration Court of the Russian Federation (2014)
- Expanding the powers of the President to appoint prosecutors (2014)
- Introduction to the Federation Council of additional representatives of the Russian Federation, appointed by the President of the Russian Federation, and constituting no more than 10% of the remaining members of the Federation Council (2014)
- In the Presidential Address to the Federal Assembly of the Russian Federation on January 15, 2020, the President of the Russian Federation V.V. Putin proposed the amendments to the Constitution of the Russian Federation concerning substantial changes in the political system and the work of the executive, legislative, and judicial branches. The amendments were made following the results of the all-Russian vote on 1 July 2020, and provide for enshrining in the Constitution the following provisions:
- Mandatory requirements (citizenship and residence period) for persons holding positions critical to ensuring the security and sovereignty of the country (the President of the Russian Federation; heads of the constituent entities of the Federation; members of the Federation Council; deputies of the State Duma; the Prime Minister, his deputies; federal ministers; heads of other federal bodies; judges). For candidates for the post of President of the Russian Federation, the requirements include the absence of foreign citizenship or a residence permit in another state, not only at the time of the elections but at any time before, as well as a permanent residence in Russia for at least 25 years;
- A unified system of public authority aimed at improving the interaction between state and municipal authorities (expanding and increasing the powers and real capabilities of local self-government)
- Social obligations (introduction of a minimum wage rate that cannot be lower than the subsistence minimum of the working-age population; regular indexation of pensions)
- The status and role of the State Council, which would provide an opportunity for a professional, comprehensive, and high-quality consideration of the most significant issues for citizens and the country
- On non-execution in the Russian Federation of decisions of interstate bodies contradicting to the Constitution of the Russian Federation
- Strengthening the role of the Constitutional Court: empowering the Court to verify the constitutionality of draft laws adopted by the Federal Assembly at the request of the President before they are signed by the head of state

## Conclusion

In Russia, the development of the system of state administration is aimed at increasing its

efficiency, resolving the challenges facing the state and society. The administrative reform, like a number of some other changes, carried out in Russia in recent decades, has led to visible improvements in the functioning of the state apparatus, the use of new management technologies in state regulation, and the provision of public services. Some of the problems remain relevant, and some are escalating in the time of increased global competition. In the face of growing geopolitical tension, to neutralize these threats, it is necessary to increase the efficiency of public administration, especially in the socioeconomic field, as well as to search for new sources of economic development to increase national competitiveness.

In this regard, the Russian public administration system is subject to special requirements from society and business structures for its functioning as a well-coordinated system of institutions belonging to various branches and levels of government. At the same time, the main elements of such a system should be active and permanent managerial relationships between citizens, the business, expert community and public authorities. This requires further administrative reformation of the state apparatus with all its elements and interconnections, as well as updating the relevant rules (norms) of state-official activities.

This presupposes the implementation of the following set of tasks for the development, first of all, of the system of Executive power:

1. Optimization of the structure and work process of federal executive bodies. First of all, it is necessary to carry out a significant reform of the structure of the state apparatus to exclude parallelism and duplication of functions of ministries, services, and agencies, as well as a more clear distribution of activities between federal structures. Over the years, the authorities have repeatedly tried to delimit the spheres of competence and interconnections between the Administration of the President of the Russian Federation, the Security Council of the Russian Federation, and the Government of the Russian Federation as well as optimize the functions of the President of the Russian Federation and the Government of the Russian Federation in the economic sphere (for example, the formation of a three-tier system of federal executive bodies authorities: "ministry – service – agency"). Over the years, the authorities have repeatedly tried to demarcate the spheres of competences and responsibilities between the Administration of the President of the Russian Federation, the Security Council of the Russian Federation, and the Government of the Russian Federation as well as optimize the functions of the President of the Russian Federation and the Government of the Russian Federation in the economic sphere (for example, the formation of a three-tier system of federa executive bodies: "ministry – service – agency"). However, the existing level of interface requires further "polishing" of administrative processes and combining them with new technologies that are broadly used by citizens and businesses.
2. It is necessary to improve the process of interaction between various institutions of power, to provide optimal conditions for the President of the Russian Federation to exercise his constitutional powers in order to ensure the coordinated functioning and interaction of public authorities, as well as to ensure the optimal mechanism for making state decisions. In addition to that, the strengthening of the subordination of the structures of the executive branch requires special attention.
3. Strengthening the procedures for responsibility of officials and civil servants. It is planned to legislatively establish exact criteria, principles, and procedures for determining the areas of responsibility for members of the Government of the Russian Federation to the President of the Russian Federation and the Federal Assembly (parliament) of Russia, as well as to strengthen the basic principles of responsibility in the public administration system.
4. For effective centralized management of the constituent entities of the Russian Federation, it is planned to reorganize and improve the system of federal districts and the functions of plenipotentiary representatives of the President of the Russian Federation. To solve this problem, it is proposed to legislatively establish a system for organizing territorial executive

bodies, taking into account the system of federal districts, universalizing the system of managerial, organizational, and other interconnections between the center and regions as well as a more definite delineation of the competence and powers of the federal center and the constituent entities of the Federation. At the legislative level, it is necessary to consolidate the principles and procedures for delineating the spheres of competence, responsibility, and accountability of territorial structures of federal executive bodies and executive bodies of the constituent entities of the Federation.

## Synonyms

Form of government; Particular form of government; Set of government principles and laws; System of politics

## Definition

A coordinated set of principles, laws, ideas, and procedures relating to a particular form of government or the form of government itself. It is compared to the legal system, economic system, cultural system, and social systems.

## Introduction

Russia is a democratic federal republic with the president as the head of the state. Following the basic principles of democracy, the constitution provides for the separation of powers into legislative, executive, and judicial branches, which are to be independent. The executive power is split between the president and the prime minister, but the president is the dominant figure. The legislature is represented by the Federal Assembly of Russia. It has two chambers: the State Duma (the lower house) and the Federation Council (the upper house). The judicial power is vested in courts and administered by the Ministry of Justice. Unlike most of the contemporary republics, the president of Russia does not belong to the executive or any other branch of power, although he has enough authority to influence governmental activities. According to the *Constitution of the Russian Federation*, the president ensures coordinated functioning and interaction of all the bodies of state power.

### History of Establishment of Presidency in Russia

For the first time, the idea for establishment of presidency in our country gained the upper hand during the soviet "perestroika" in 1990 when the Office of the President of the USSR appeared. A short time later, the institution of presidency was introduced in Russian Soviet Federative Socialist Republic as a result of the all-Russian referendum. The status of the president had been significantly changed with the adoption of the Constitution of the Russian Federation in 1993 which proclaimed the president the head of the state.

The 12th of July 1991 become the day of the elections of the first *president of Russia*. Boris Yeltsin had held this position till 2000 when he had sent in his resignation and announced his successor Vladimir Putin. On December 31, 1999, he became acting president. On March 26, 2000, Putin was elected president of Russia and was inaugurated on May 7, 2000. On March 14, 2004, he was elected president of Russia for the second term. Since May 8, 2008, Vladimir Putin is a prime minister of Russia. Dmitriy Medvedev was president of Russia in 2008–2012. On March 4, 2012, Putin was elected president of Russia and inaugurated on May 7, 2012.

### Functions of President

The president's main function is to act as a guarantor of the constitution and of the rights and freedoms of humans and citizens. He takes measures to protect the sovereignty of Russia and determines the guidelines of the internal and foreign policies of the state.

The institution of presidency itself is sufficiently new for our country. Its evolution and development in Russia has been highly influenced by various national and historical features, such as stable tradition of strong individual power vested in tsars, emperors, and general secretaries in different periods of Russian history.

The president of Russia does not belong to the executive or any other branch of power, although he has enough authority to influence governmental activities.

The president is a guarantor of the constitution and of the rights and freedoms of humans and citizens. He takes measures to protect the sovereignty of the Russian Federation, its independence, and state integrity and ensures coordinated functioning and interaction of all the bodies of state power. He also determines the guidelines of the home and foreign policies of Russia and represents the Russian Federation within the country and in international relations.

Any citizen of the Russian Federation not younger than 35 years of age and with a permanent residence record in Russia of not less than 10 years may be elected president. The president is elected for 6 years on the basis of universal, equal, direct suffrage by secret ballot. One and the same person may not be elected president of Russia for more than two terms running.

When taking office, the president of the Russian Federation takes the following oath of loyalty to the people:

> I swear in exercising the powers of the President of the Russian Federation to respect and safeguard the rights and freedoms of human and citizen, to observe and protect the Constitution of the Russian Federation, to protect the sovereignty and independence, security and integrity of the State, to faithfully serve the people.

This oath is taken in a solemn atmosphere in the presence of members of the Council of the Federation, deputies of the State Duma, and judges of the Constitution Court of the Russian Federation.

### Authority of the President of Russia

The president of Russia possesses vast authority in government. By agreement with the State Duma, he appoints the chairman of the Government of the Russian Federation, appoints all the federal ministers, and decides on their resignation.

The president presents to the Council of the Federation candidates for appointment as judges of the Constitution Court, the Supreme Court, as well as a candidate for the post of the procurator-general of the Russian Federation, and appoints judges of other federal courts.

The president is also the commander in chief of the Armed Forces of the Russian Federation.

The president has certain powers in his relations with the legislative branch. Thus, he may introduce bills to State Duma, he has the right to veto laws adopted by the Federal Assembly, and he is also empowered to dissolve the State Duma in case it rejects three times the candidates for the post of the chairman of the government.

The president of the Russian Federation may cease to exercise his powers short of the term in case of his resignation, in case of stable inability to exercise the powers vested in him because of health reasons, or in case of impeachment.

The president may be impeached by the Council of the Federation only on the basis of the

charges of high treason or another grave crime, advanced by the State Duma and confirmed by the conclusion of the Supreme Court on the presence of the elements of crime in the actions of the president and by the conclusion of the Constitution Court confirming that the rules of advancing the charges were observed.

### The Parliament

The bicameral Federal Assembly makes federal law, approves treaties, declares war, and has the power of the purse. Both its chambers are located in Moscow. The legislative and representative body of the Russian Federation is the Federal Assembly. The Federal Assembly consists of two chambers – the Council of the Federation and the State Duma. The Federation Council of Russia is the upper house of the Russian Parliament. Created by the 1993 constitution, it acts as a voice of Russia's federated entities. The Council has explicitly stated that no political factions are to exist in the upper house. Unlike the State Duma, the Council is not directly elected. It consists of representatives of Russia's federal entities – each has two. One is elected by the entity's legislature; the other is nominated by the entity's head. The terms of the members are not nationally fixed but depend on the terms of the regional bodies that chose them.

### The Council of the Federation

The Council of the Federation includes representatives from each subject of the Russian Federation, while the State Duma is an elected chamber containing 450 deputies. The executive power in Russia is represented by the Government of the Russian Federation which consists of the chairman of the government, deputy chairman of the government, and federal ministries. The president of the Russian Federation appoints the chairman of the Russian Government with the consent of the State Duma.

Establishing the judicial power the Constitution emphasizes that justice in the Russian Federation shall be administered by courts alone. The judicial power in Russia is exercised by means of constitutional, civil, administrative, and criminal proceedings. The fundamental institutions of the Russian judicial system are the Constitution Court and the Supreme Court of the Russian Federation. The Constitution Court plays the major role in the whole system of government as it considers cases on the correspondence of legislation and regulations at all levels of government to the Constitution of the Russian Federation.

The Constitution establishes certain provisions for the mechanism of "checks and balances" to be put into effect. Thus, the president may veto laws adopted by the Federal Assembly, but the majority of two thirds of the total number of the members of the Council of the Federation and of the deputies of the State Duma can override the veto.

The President of the Russian Federation presents to the Council of the Federation candidates to be appointed as judges of the Constitution Court, the Supreme Court, as well as a candidate for the post of the procurator-general of the Russian Federation and appoints judges of other federal courts.

He is also empowered to dissolve the State Duma in case it rejects three times the candidates for the post of the chairman of the government. At the same time, the jurisdiction of the State Duma includes bringing an accusation against the president of the Russian Federation for his impeachment.

### The State Duma

The term Duma comes from the Russian "dumat" ("to think"). Compared to some European democracies, the Russian Duma is quite a youngster. Founded in 1906, it did not survive the 1917 revolution. But it bounced back in 1993, when Russia's first president, Boris Yeltsin, introduced a new constitution. The State Duma may also express no confidence to the Government of the Russian Federation, and the president shall be free to announce the resignation of the government or to reject the decision of the State Duma. In case the State Duma again expresses no confidence to the government during 3 months, the president may accept this or dissolve the State Duma.

As a federal state, the Russian Federation consists of 85 regions called "subjects (jurisdictions) of federation." These are republics, krais (territories), oblasts (regions), autonomous okrugs

(areas), and three cities of federal importance – Moscow, St. Petersburg, and Sevastopol (since 2014).

The subjects of federation are declared to be equal. They are empowered to adopt their own legislation within the frameworks determined by the Constitution. They also establish their own systems of regional government independently though in a strict accordance with the principles of the constitutional system of Russia.

The Judiciary

Three types of court make up the Russian judiciary:

- The courts of general jurisdiction (including military courts), subordinated to the Supreme Court
- The arbitration court system under the High Court of Arbitration;
- The Constitutional Court (as well as constitutional courts in a number of federal entities)

The municipal court is the lowest adjudicating body in the general court system. It serves each city or rural district and hears more than 90% of all civil and criminal cases.

## Conclusion

Russia is a federal presidential republic where the executive power is split between the *president* of the Russian Federation and the prime minister, but the president is the dominant figure. According to *Constitution of the Russian Federation*, the state power in the Russian Federation is exercised on the basis of its division into legislative, executive, and judicial power. The bodies of legislative, executive, and judicial power are independent. The legislature is represented by the Federal Assembly of Russia. The judicial power is vested in courts and administered by the Ministry of Justice.

## Same-Sex Marriage as Social Policy

Jaegoo Lee
Jackson State University, Jackson, MS, USA

### Synonyms

Opposite-sex couple: heterosexual couple; Same-sex couple: homosexual couple, gay, and lesbian couple; Sexual orientation: gender identity; Statutory language: lawful, legal, or judicial language

### Definition

*Marriage* is much more than a permit allowing two individuals to make a commitment to each other or a legally sanctioned contract between a husband and wife. Under a marriage contract, the legal status of both parties gives the husband and wife new rights and obligations as well as benefits, such as tax relief, medical decision-making power, and state spousal benefits. Until the recent Supreme Court ruling, the term *marriage* was restricted to the legal union of a man and woman.

*Same-sex marriage* refers to a legally recognized marriage between two spouses of the same gender, having the same rights and benefits as legally married opposite-sex couples.

*Civil unions* are legally recognized unions of a same-sex couple with rights similar to those of an opposite-sex married couple.

*Domestic partnerships* are a form of relationship that gives limited state rights to both same-sex and opposite-sex couples who live together but wish to remain unmarried.

### Introduction

After decades of states' resistance to allowing individuals of the same sex to marry, on June 26, 2015, the US Supreme Court finally ruled that marriage is a constitutional right protected by the 14th Amendment. States could no longer deny any couple that right, including same-sex couples (Liptak 2015). Such ruling concluded the debates on not only the human right of same-sex couples but also the definition of marriage as an intimate relationship. Due to the legal definitions of marriage and spouse, same-sex couples faced a challenge to marry and form a family. Such challenge to same-sex couples was resolved by the 2015 Supreme Court decision.

The revolution of same-sex marriage as social policy based on the 2015 US Supreme Court's ruling implies that the definition of marriage has been changed. The court has always thought of marriage as both an individual right and a positive social good – as the foundation of the family and

of society. However, legalizing same-sex marriage represented that love and intimacy is more important to form a family, and sexuality is not the basis of forming a legal marital union. As a result, same-sex couples are granted the rights and obligations of a legal couple regardless of sexuality.

## Brief History of Same-Sex Marriage

While the civil rights campaign took place in the 1960s, the public national discussion on same-sex marriage first began in 1993 when the Hawaii Supreme Court ruled that laws denying same-sex couples the right to marry violated state constitutional equal protection rights unless the state could show a "compelling reason" for such discrimination (Baehr v. Lewin 1993; Karger and Stoesz 2013). The ruling led to federal actions, as well as actions by several states, to restrict marriage to opposite-sex couples, in particular the Defense of Marriage Act (DOMA 1996). After Hawaii's decision raised the possibility that states could recognize same-sex marriage, 32 state legislatures adopted statutory language that defined marriage as a relationship between a man and a woman. Nebraska adopted a constitutional provision limiting marriage to relationships between a man and a woman. As a result, 40 states had statutory and/or constitutional provisions limiting marriage to opposite-sex couples by the end of 2000 (Karger and Stoesz 2013).

Starting in 2000, some states began recognizing same-sex relationships. For example, Vermont approved landmark legislation to recognize civil unions between same-sex couples, granting them virtually all the benefits, protections, and responsibilities that married couples have under Vermont law. The Vermont legislation was a result of the state Supreme Court ruling in Baker v. Vermont (1999) that said same-sex couples are entitled, under the state constitution's "Common Benefits Clause," to the same benefits and protections as married opposite-sex couples (Goldberg 2000). The court ruled that the Vermont General Assembly must decide how to provide these benefits and protections, either by legalizing marriage for same-sex couples or by establishing an alternative system. The Vermont General Assembly decided to preserve marriage as the "legally recognized union of one man and one woman," but at the same time created a parallel system, civil unions, for same-sex couples that went beyond existing "domestic partnership" and "reciprocal beneficiaries" (Baker v. Vermont 1999).

From then to 2015, various lower court decisions, state legislation, and popular referendums legalized same-sex marriage to some degree in 38 of the 50 US states, in the US territory Gaum, and in the District of Columbia. As a result of the Massachusetts Supreme Judicial Court ruling in Goodridge v. Department of Public Health (2003), the state of Massachusetts became the first state to legalize marriage for same-sex couples. In 2003, the Massachusetts Court ruled that it was unconstitutional under the Massachusetts constitution to allow only opposite-sex couples to wed. The court concluded, "Segregating same-sex unions from opposite-sex unions cannot possibly be held rationally to advance or preserve" the governmental aim of encouraging "stable adult relationships for the good of the individual and of the community, especially its children" (Burge 2003). Under this decision, the state of Massachusetts legalized same-sex marriage to begin issuing marriage licenses to same-sex couples on May 17, 2004.

In the same year, the US Supreme Court ruled in Lawrence v. Texas (2003), which was a landmark decision by the US Supreme Court (McBride 2006). The Court struck down the sodomy law in Texas and, by extension, invalidated sodomy laws in 13 other states, making same-sex sexual activity legal in every US state and territory. Since then, several states enacted a state law providing civil unions to same-sex couples, including Connecticut (2005), New Jersey (2006), and New Hampshire (2007). Such approach shows the redefining of marriage. For example, the New Jersey Supreme Court ordered the legislature to redefine marriage to include same-sex couples or to establish a separate legal structure, such as civil unions, to give same-sex couples the same rights as opposite-sex marriage couples (Lewis v. Harris 2006). The New Jersey legislature chose to create civil unions in 2007,

which gave same-sex couples the same legal rights as married, opposite-sex couples. Until 2009, a few state Supreme Courts ruled that same-sex couples should have the right to marry and that a ban against same-sex marriage was in violation of the equal protection clause in the state constitution. In 2009, the Connecticut General Assembly passed a statute allowing same-sex marriage and ending civil unions (Connecticut General Assembly 2015).

The pace of state legislative action quickened in 2012 in several states, including Washington, New Jersey, Maryland, and Maine. For example, the Washington state legislature and governor approved legislation establishing same-sex marriage, and then the law and same-sex marriages began on December 6, 2012. Such legislative actions supporting same-sex marriage continued in 2013. Delaware passed same-sex marriage legislation, and Governor Markell signed the bill into law. The law converted civil unions to marriage, and recognized civil unions and same-sex marriage from other jurisdictions (Ramseyer 2013).

In 2013, the US Supreme Court overturned a key provision of DOMA, declaring part of it unconstitutional – the provision of DOMA, passed in 1996, that limited federal recognition of marriages to different-sex couples. The Windsor v. United States ruling prompted an unprecedented wave of lawsuits in every state where same-sex couples were not permitted to marry (Windsor v. United States 2013). After numerous rulings in these cases affirming the right of same-sex couples to marry in a series of states, the Supreme Court's June 2015 decision meant that same-sex couples could marry anywhere in the country.

In addition to the legislation at the state level, the US Supreme Court decided to challenge the federal DOMA law that limited over one thousand federal benefits to marriages defined as a relationship between a man and a woman. It ruled that the restriction violated equal protection and due process for married same-sex couples. The decision emphasized the dominance of state law defining marriage and required the federal government to recognize same-sex marriages granted under state law.

## Marriage as a Fundamental Right

As the 2015 US Supreme Court concluded the decades-long debate or battle over same-sex marriage, the decision confirmed that same-sex marriage is a fundamental human right regardless of sexuality. The US Court has always thought of marriage as both an individual right and a positive social good as the foundation of family and of society (Goetting 2013). The right to intimate association for same-sex couples – protecting the dignity of same sex relationships from the stigma of criminal prosecution – does point toward the fundamental right of the people to marry (Goetting 2013). Accumulated US Court cases such as Romer v. Evans (1996), Lawrence v. Texas (2003), and Windsor v. United States (2013) have confirmed that same-sex couples are meant to be included more fully and equally into the same constitutional protections. Finally, Judge Anthony M. Kennedy, citing Loving v. Virginia case (1967), argued that marriage is a foundational right to all people regardless of gender or sexual orientation:

> A first premise of the Court's relevant precedents is that the right to personal choice regarding marriage is inherent in the concept of individual autonomy. This abiding connection between marriage and liberty is why Loving [v. Virginia] invalidated interracial marriage bans under the Due Process Clause. (Obergefell v. Hodges 2015, p. 12)

> A second principle in this Court's jurisprudence is that the right to marry is fundamental because it supports a two-person union unlike any other in its importance to the committed individuals. (Obergefell v. Hodges 2015, p. 13)

## Marriage No Longer Tied to Sexuality but Now Tied to Love

The long discussion between states and same-sex couples to form legal marriage came to conclude that marriage is no longer inherently tied to sexuality or sexual orientation. US District Court Judge Wright Allen came to a similar conclusion in her ruling against Virginia's banning of same-sex marriage (Harris v. Rainey 2014). The judge argued that gay and lesbian individuals, like

heterosexuals, should have the same legal rights to form a marriage based on intimate emotional connections:

> Gay and lesbian individuals share the same capacity as heterosexual individuals to form, preserve and celebrate loving, intimate and lasting relationships. Such relationships are created through the exercise of sacred, personal choices – choices, like the choices made by every other citizen, that must be free from unwarranted government interference. (Harris v. Rainey 2014, pp. 22–23)

Judge Allen concluded that the legal definition of marriage should be based on romantic or emotional ties by making connections to the 1967 Loving v. Virginia Supreme Court ruling. The 1967 Supreme Court decision ruled in favor of Mildred and Richard Loving and struck down Virginia's ban on interracial marriage, in citing the equal protection clause of the 14th Amendment to the US Constitution. Also citing the 14th Amendment as a basis for her ruling, Judge Allen made an even stronger connection between her ruling and the previous 1967 case. As a preface to her ruling, Judge Allen quoted the speech that Mildred Loving delivered on the 40th anniversary of the Loving v. Virginia decision:

> . . . not a day goes by that I don't think of Richard and our love, our right to marry, and how much it meant to me to have that freedom to marry the person precious to me, even if others thought he was the "wrong kind of person" for me to marry. I believe all Americans, no matter their race, no matter their sex, no matter their sexual orientation, should have that same freedom to marry. Government has no business imposing some people's religious beliefs over other . . .. (Harris v. Rainey 2014, p. 1)

Judge Kennedy again made connections to the *Loving* case to conclude that marriage is an event between two persons regardless of sexuality: Commitment to marriage is more important than sexuality. Both Judge Allen and Judge Kennedy concluded that the legal definition of marriage should be based on romantic or emotional ties. More importantly, the ruling by Judge Allen, like the Iowa Supreme Court decision, is a rising indication that the legal definition of marriage is changing in response to the institutional and structural changes.

The 2015 decision implied the redefining of marriage from a relationship between one man and one woman to a relationship between two persons, including a relationship between diverse compositions of gender or sexual orientation. In addition, the decision confirmed the change of the legal marriage definition would be based on romantic or emotional ties. Again, this decision presented that the legal definition of marriage does not imply an ability, desire, or premise to procreate. Such decision indicated the importance of a relationship to form a family rather than other functions of marriage. As marriage has become more of a partnership based on romance and love, then the focus is on a collaborative partnership more than on maintaining distinct, separate roles for husbands and wives. If distinct gender roles are no longer inherently required in a marriage, it appears logical that a marital partnership based on romance is not inherently linked to heterosexuality:

> . . . That is not to say the right to marry is less meaningful for those who do not or cannot have children. An ability, desire, or promise to procreate is not and has not been a prerequisite for a valid marriage in any State. In light of precedent protecting the right of a married couple not to procreate, it cannot be said the Court or the States have conditioned the right to marry on the capacity or commitment to procreate. (Obergefell v. Hodges 2015, pp. 15–16)

## Marriage as Key Stone in the Society

Judge Kennedy argued that same-sex marriage can contribute to a society as a legal union: "No union is more profound than marriage, for it embodies the highest ideals of love, fidelity, devotion, sacrifice, and family. In forming a marital union, two people become something greater than once they were (Obergefell v. Hodges 2015, p. 33)." It appears that the judge responded to same-sex couples' argument regarding their beliefs on marriage. According to Judge Kennedy, same-sex couples have demonstrated that

marriage embodies a love that may endure even past death. It would be a misunderstanding to say that these men and women disrespect the idea of marriage. They do respect it so deeply that they seek to find its fulfillment for themselves. Their hope is not to be condemned to live in loneliness, excluded from one of civilization's oldest institutions. They ask for equal dignity in the eyes of the law. The 2015 Court decision grants them that right as expressed below:

> Fourth and finally, this Court's cases and the Nation's traditions make clear that marriage is a key stone of our social order . . . There is no difference between same- and opposite-sex couples with respect to this principle. Yet by virtue of their exclusion from that institution, same-sex couples are denied the constellation of benefits that the States have linked to marriage. This harm results in more than just material burdens. Same sex couples are consigned to an instability many opposite-sex couples would deem intolerable in their own lives. As the State itself makes marriage all the more precious by the significance it attaches to it, exclusion from that status has the effect of teaching that gays and lesbians are unequal in important respects. It demeans gays and lesbians for the State to lock them out of a central institution of the Nation's society. Same-sex couples, too, may aspire to the transcendent purposes of marriage and seek fulfillment in its highest meaning. (Obergefell v. Hodges 2015, pp. 16–17)

## Conclusion

Under the ongoing debates surrounding same-sex marriage, the US Supreme Court ruled that same-sex marriage is legal: No matter their gender or sexual orientation, people can marry whomever they love. As a result of the same-sex marriage ruling, it is obvious that the definition of marriage has changed, specifically that marriage is not related to sexuality and more weight is placed on love to form a family legally, it is consistent with fundamental values of marriage, and the same legal rights are provided to both same-sex couples and opposite-sex couples. This shows the functional and legal changes in defining legal marriage. Legal conditions affect how people live their lives. As society has begun to treat same-sex couples more like opposite-sex couples, it could be that the differences between the two groups have narrowed. Some people still have questions about whether marriage will have the same stabilizing effect on same-sex couples and their families that we have seen with opposite-sex couples. Still, people want evidence that same-sex couples have a strong desire to be married based on love and emotional ties and have views about the purpose of marriage that are similar to those of the opposite-sex population.

# Sampling Methods in Public Administration Research

Mirko Pečarič
Faculty of Public Administration, University of Ljubljana, Ljubljana, Slovenia

## Synonyms

Sampling rate; Sample rate; Sampling frequency; Sampling distribution

## Definition

Sampling methods are techniques in which studied variables or items are selected at random from a population and then used to make inferences on the whole population.

## Introduction

Provided that regulation is one definition of control (Merriam-Webster 2016), it is possible for regulators to be more objective if they have better "control over control" and if they better understand the "meta-importance of control" in the management of public affairs. If we want to analyze the administration's decision-making, special emphasis should be given on the decision's element of control that is present in all the elements (planning, doing, acting) of decision cycle. Given the fact that regulations/future decisions are mostly done by inductive inferring from the past cases on a whole regulated population, this practice must base its decisions on evidence. A focus should be given on the estimation of cases' probabilities in regulated areas through which administrators could talk about the established degrees of control. With this goal in mind, the following lines will address a fundamental difference between the (non)probability sampling plans as the methods of obtaining evidence in the frame of uncertainty and chance. Without being properly elaborated, public (or private) decisions cannot be taken for granted in the context of numerous facts, information, people, and actions. Under these conditions, the classical/logical/intuitive ways of decision-making cannot consistently address complex phenomena. Among factors that can be considered in such conditions are the number and relative size of items (sampling units) in a regulated population, the risk of error, the statistically (tolerable) rate of deviation, stratification, and value-weighted selection. All these notions are tightly connected to control which can be administrated through sampling methods that base their decisions on professionally obtained and analyzed data.

Research based on a population's sample is nowadays commonly accepted approach for the collection of statistical data (Kalton and Vehovar 2001) and the aspect that hardly any approach to psychology and behavioral science can miss or evade (Fiedler and Juslin 2006). Despite this, the role of sampling is not so commonly present in public administration and many times confused with taking individual samples. Samples used in social and commercial surveys are usually less random (often by design) than many people realize. Unless it is understood, this "non-randomness" can compromise the conclusions drawn from the data (Dorofeev and Grant 2006). Decision-makers should be acknowledged with the traps of nonrandom data collection in regulation. Inferences about the population's sample size should be known in advance, so in the following parts, sampling and its methods will be presented to encourage decision-makers for the use of sampling in the administration of public affairs.

## Public Services Can Be Evaluated Through the Quality Control

The ultimate goal of public services is not only to ex post determine the successfulness of rules/services through the review and elimination of "bad" examples but primarily to achieve the ex ante compliance of rules'/services' results with the former. Quality control (QC) must be "implanted" in the administrative *system* as such,

and not (only) in a product/service. Quality cannot be ensured only in the ex post process of review, because it does not address quantity, but a degree of value, i.e., acceptability that must be nonstop present in monitored units. QC is a management technique or group of techniques that ensures the equal and acceptable quality of products/services. Its aim is to establish cost−/value-justified quality standards that are acceptable for administrators and citizens, to analyze trends and the extent of deviation from quality, as well as to find causes for deviations using statistical techniques, to introduce necessary corrective measures to maintain quality at a certain level, and to avoid services with unacceptable quality. QC must not only ensure but keep up certain requirements of a rule/service. It is necessary to establish standards for the latter, delegate a controlling unit, appoint supervisors/examiners, and implement and manage a whole organization toward the wanted results.

Because statistics is the science of collecting, measuring, analyzing, and interpreting masses of facts, it is the "natural candidate" for ensuring the quality of products/services. Statistical QC is used as a technique for using statistical methods based on mathematical *probability* theory (Savage 1954). The aim of using probability theory in sampling is to ensure the equal, representative, and appropriate level of quality standards and to maintain these standards in the most economical way. Statistical methods are based on probability and can assist other procedures that also try to ensure quality in an institution's activities. The former serves for the faster, more objective detection and determination of problems (risk assessment through the representative and random sampling), but it is not reasonable to introduce them to practice if there is no system to manage them (risk management).

## Sampling

Quality control means the use of *statistics* (as inductive reasoning) and *probability* in sampling techniques to determine a level of risk. Likewise, a regulator (as the controller) could apply QC methods to obtain an entire set of data (100% testing or census) or may choose to draw conclusions about the entire set of data (population) from a representative sample of items selected from the data: this procedure is called *sampling.* Due to the lack of time, limited resources, and workload, priorities are created among different goals. Sampling is the application of control procedures to the less than 100% of items within a relevant population so that all units have a chance of selection to provide the auditor a reasonable basis on which conclusions on the entire population can be made. A statistical sampling includes the *random* selection of representative number of sample items, and the use of probability theory to evaluate the sample results, including the measurement of sampling risk (a sampling approach that does not have these characteristics is nonstatistical sampling and should be used with caution). This allows the auditor to determine the sample size, evaluate the results quantitatively, estimate the sampling risk, and thus draw conclusions about the whole population. Sampling requires the use of professional judgment in the planning, testing, and evaluation stages. A controller must always carefully consider whether a nonstatistical sample provides a reasonable basis for drawing conclusions about the population from which they were drawn. Sampling is used in a variety of fields, including for the management and administrative purposes. Samples are dealt with by a special branch of statistics, i.e., inferential statistics.

### Sampling Methods

A population is usually too large for the examiner to survey all of its members/parts. In such cases, a smaller sample can be used to represent the population. A probabilistic sample has to obey quite a simple procedure and does not need carefulness (as the nonrandom samples) to reflect the characteristics of the population from which it is drawn. Control by the collection of samples (sampling inspection) involves a random check of a relatively small number of items from series; based on the sampling results, a decision is made about the acceptance or rejection of the series. Samples can be probabilistic (each has an equal chance of

being selected) or non-probabilistic ((a) goal-oriented, participants with certain properties or quota sampling; (b) ad hoc, voluntary participation within the judgment and snowball sampling). Within the former, each item in the population has a known non-zero probability of being selected (because of the known representative sample number vis-à-vis the total population), while in the latter, items are selected from the population in different nonrandom manners. "The advantage of probability sampling is that sampling error can be calculated. Sampling error is the degree to which a sample might differ from the population" (StatPac, Inc. 2004). Only probability samples can be used for statistical inferences that are the basis for the calculation of confidence intervals.

The best-known sampling models are *simple random sampling with repetition* (the same part can be taken into consideration several times, they all have the same probability of selection, components are mutually independent) and *without repetition* (the same part cannot be taken into consideration more than once, samples are mutually dependent; if the same unit is selected more than once, it may only be used the first time). The choice is a combination of sample size ($n$) from the total number ($N$) and a determination of a threshold for the toleration of mistakes ($m$) or the rejection ($r$) of the sample. There are three types of acceptance sampling plans in general use: single, double, and sequential. To avoid more or less difficult calculations of the values and probabilities for the inspection of attributes, tables with already made calculations can be used, such as the ANSI or AQL (acceptance quality level) military standard table MIL-STD 105E, or other commercial standards. For each amount, the acceptable % of defects can be determined, and then a table gives errors that are (not) acceptable.

*Systematic sampling* is a type of probability sampling method that can be used instead of random sampling (it is also known as the Nth selection technique). After the required sample size ($n$) has been calculated, every Nth item (k) must also be calculated from a whole sheet of population units (N). It is named the sampling interval or simply "skip." It is calculated as $k = N/n$. The advantage over the first technique can be found in its simplicity and the equal probability of selection, although here every possible sample of a certain size does not have an equal chance of being chosen (in the first, the probabilities are the same for each unit, while in the second, they are focused on every Nth unit). Within this method, "sample members from a larger population are selected according to a random starting point and a fixed periodic (sampling) interval. . .is calculated by dividing the population size by the desired sample size. Despite the sample population being selected in advance, systematic sampling is still thought of as random if the periodic interval is determined beforehand and the starting point is random" (Investopedia 2016). Because every Nth element is selected, it is advisable that $N$ is homogenous, i.e., that it does not contain any hidden order by which units are selectively placed on the sheet. If this condition is met, this sampling method resembles the first.

In addition to simple random sampling with which estimates of the population's parameters are the most unbiased, and systematic sampling where each Nth unit is taken based on a pre-established rule, there is also *random stratified sampling* (stratum – a layer; a population that is usually quite varied is divided into homogeneous subgroups, and from them the simple random and/or systematic patterns are formed within groups) as an extension of random sampling, where the population is divided into separate groups, and then a random selection of units from the group is made. After the sample size $n$ is determined, the size is allocated between strata so that each stratum has the same number of units in the sample (even allocation) or the number of units is selected proportionally given the stratum's size in the sample. Based on all the above-given sampling contents, a procedure is proposed that can be tested and subjected to the expert assessment (Fig. 1).

There is no objective certainty; it is therefore crucial that data collection and sampling techniques are carefully chosen for an overall estimation of some field and/or regulation. The model is a reasonable basis for the implementation of control over a specific institution that needs to fill its data into a sampling process. The obtained result

**Sampling Methods in Public Administration Research, Fig. 1** Sampling method (Source: own construction)

of acts' general correctness can give us only the sample's general correctness or the whole group's correctness (to which can be inferred with a certain confidence interval) with no specifics about each tested case or what should be done with it. The system of QC can be better determined from the examination of samples vis- à-vis the classical elimination of errors in adjudication through the normal channels (amendments of a program, a circular with the indication of errors and their solutions) and determination of new regulatory/service foundations.

## Use Sampling with Caution for the Future Cases

Statistical models can be used for the past (adjudication, the testing of hypotheses, explanation) that indicate the strength of relationship (in-sample strength-of-fit) or for the future (regulation, prediction) in which the accuracy of out-of-measurable-sample predictive power can be estimated. For the first methods, the regression analysis (the coefficient of determination or $R^2$) and structural equation models (chi-squared, Akaike information criterion) can be used, while for the second, the predictive analytic tools can be utilized (all statistical models, machine learning, and data mining algorithms that can produce predictions, like the k-nearest neighbor algorithm, random forest, decision tree learning (CART), Monte Carlo method, or Bayesian networks) (Shmueli et al. 2017). A further step from sampling toward the better future decisions is the so-called field of business analytics or data mining.

Regulation is future-oriented, and because of this fact, experts (if they/there are) cannot solve all

problems alone. Adjudication is based on causation and regulation on association. The first is focused on the correct findings of facts, while the second on the probability of emergence of predicted events (the grouped, measured, and averaged data); the first reduces bias, the second captures variance. Regulation should be more based on the extraction of information from the large(r) data sets and a variety of data structures. Alternative dispute resolution is also more forward-looking activity than classic adjudication, so for both parts, there must be found a method that could build its solutions on more numerous and different data.

Without knowledge of the fundamental principles of sampling, the design and analysis of probabilistic models not only suggest greater prudence with their use but no use at all. Sampling errors can reduce or even eliminate the usefulness of results. In the worst case, risks may be even higher than before. Population units should have probabilities known in advance (greater than zero, they can be the same for all or different between units) for the inclusion of units in probability samples. A non-probability sample does not have a known probability (this is its main disadvantage). Inferences from a sample concerning the population can only be made if a probability sample is created by sampling techniques.

## Conclusion

Transparency is a basic ingredient for democratic accountability; the known methods and information that were used to establish the facts are not only an essential part of the decision-making process and the explanation of decisions but also of the evaluation of a decision (and its explanation) by the public. The latter should know how risks were established. This chapter will, therefore, deal with one of the ways by which risks/probabilities can be established, i.e., by using sampling methods. Although regulation encompasses policy choices and values, regulators should strive to establish reality as far as objectively as possible, because they do not only decide on an individual's right or obligation but regulate the rights or obligations for larger groups or the whole society. The representative and random sampling, probability, and statistical analyses of samples are usually absent in draft regulations, despite the importance of legal rules on the whole population. It is advisable to have rules that can more objectively embrace today's more and more complex relations in societies. Regulators must understand peoples' fears, how they respond to risks, and how they should act and manage those risks, while people should understand the regulators' intentions, reasons, means, and tools to achieve goals. And this two-way understanding in the highly technological, modernized, and ever-changing world can be more fully embraced if inferences are made through *deliberation* with stakeholders and by using *probability* statements. The more the latter is subjective, the greater the need to engage with the first. Research based on a sample ($n$) of a population ($N$) is nowadays a widely accepted approach to data collection, and there is no reason not to use this technique in regulation and adjudication in the public administration. Within the first, public administrations can obtain more objective, unbiased, and representative data on the factual states that are a subject of their interest to prepare draft rules for the most relevant – and thus also effective and efficient – level possible. Within the second, application of sampling methods can give similar results vis-à-vis the legality (% of illegality, of the level of confidence) of individual legal decisions in administrative procedures.

The main statement from the introduction of this paper cannot be – despite the cited works from the fields of statistics, psychology, and behavioral science – confirmed (because it was not statistically framed in relations and tested), but it should be nevertheless followed in implementation. Regulation *can* be more objective and representative if regulators use probability sampling in regulatory processes; this approach can confirm the paper's statement in the presence of better results compared with past situations. This paper is an appeal for the more systemically oriented public institutions that will base their decisions on

more professionally obtained and analyzed data. If public institutions systematically plan control, people will not see it as part of authoritative, repressive practices, but as an essential factor for the quality assurance and redefinition of their lives.

# School Bureaucracy

Nevbahar Ertas
Department of Political Science and Public Administration, University of Alabama at Birmingham, Birmingham, AL, USA

## Definition

Refers to the administrative systems governing the public school systems.

## Synonyms

Bureaucracy in school systems; Education bureaucracy; School administration

## Introduction

Bureaucracy is the dominant administrative system governing large institutions, including schools in the United States' (US) education system. Public education is the largest category of state and local spending in the United States and consequently the nation's largest bureaucracy. In fact, Meier et al. (1999) noted that "the model bureaucrat is more likely to grade papers in Des Moines than shuffle them in Washington" (p. 1027), referring to school systems being the largest public sector employers in the country.

The purpose of this entry is to provide a concise overview of bureaucratic features of schools and education systems, focusing on school bureaucracy in primary or secondary education in the United States. The discussion contains a concise review of public administration scholarship related to education in general and school bureaucracy in particular. Finally, the entry concludes with an overview of the nature and role of school bureaucracy in the context of education reform.

## Public Education as a Bureaucracy

In the United States, education is primarily the responsibility of state and local governments. The federal US Department of Education finds its origins in 1867 but did not become a Cabinet-level agency until 1980. The department was originally established to collect information and statistics on schools to assist states. Over time, the federal involvement in education has expanded. In addition to collecting information, the department provides policy guidance by identifying problem areas in education and enforcing civil rights statutes to ensure equal educational opportunity for all students. Lastly, the federal department administers distribution of about 8% of funds to elementary and secondary education and monitors their use. The rest of the financial support is provided by state and local governments, primarily through local property taxes.

Each state has its own State Department of Education, led by a state board of education

and a chief state school officer. Relying on state's constitution and statutes, state education departments interpret and facilitate the development of educational legislation regarding finance, personnel, student conduct, and curriculum and implement legislative mandates relating to education. In most states, the public education system is further divided into local school districts, which are managed by school boards representing the local community. Each school district is a geographical unit for the local administration of elementary and secondary schools. Establishing schools, developing curricula, setting requirements for enrollment and graduation and state education standards, and developing and implementing testing materials are responsibilities of various states and districts and the public and private organizations they contract with.

Due to school and district consolidations, the number of school districts in the United States has shrunk from about 117,000 districts in the 1940s to 13,600 public school districts, which operated 98,300 public schools in 2015–2016 school year (U.S. Department of Education 2017). The size and composition of districts vary widely between states. For example, by 2017, the state of Hawaii had a population of about 1.4 million, and the state of Idaho had a population of about 1.7 million; however the former had a single, statewide *school district, while the latter had 155 school districts* (National Education Association 2018).

Each school district has a superintendent that oversees schools in the district, and each school has a principal that provides leadership for the teachers, staff, and students. Students in the United States typically spend 6–8 years in elementary school and 4–6 years in secondary school and complete grade 12 by age 18 (U.S. Department of Education 2018). K-12 is a term used as a short form for the publicly supported school grades prior to college, starting with kindergarten (K) and the first through the 12th grade. In addition to public school systems, state-certified private schools and approved home school programs also provide compulsory education. About 10% of K-12 students attended private schools in 2015–2016 school year.

Public education in contemporary society contains many features associated with bureaucracy. The origins of the US bureaucracy are also often linked to the idea of administration-politics dichotomy, introduced by the political science scholar and later president Woodrow Wilson in *Congressional Government* and "The Study of Administration," originally published in 1885 and 1887, respectively (Wilson 1966). As a supporter of a merit-based **civil service reform** establishing a civil service bureaucracy based on open and transparent selection, retention, and promotion practices, Wilson advocated separating politics from administration and for social scientific study of administrative action. The idea was to cultivate bureaucratic leadership, to purge government of corruption and political patronage, and to endorse a social scientific approach to study administrative behaviors and activities to discover the most efficient ways to manage organizations. This historical period coincides with the formative period of "Industrial America: 1865–1950s" in the history of American education (Bauman 1996, p. 43). Rapid industrialization, population growth, and the modern conception of bureaucratic organizations led to an expansion and reorganization of American education during this period. A system with a clear sense of hierarchal order and laws, rules, and norms to support this expanded education system was created. Over time, a majority of states developed similar administrative structures to enforce universal standards, to certify teachers and administrators, and to pursue efficiency in school management. The idea of administration-politics dichotomy permeated education governance reforms of the era. The administrative tasks were delegated to experts/specialists and the policy decision-making to smaller school boards, presumably separating politics and administration and preventing corruption. The notions of "schools as factories," "scientific management," and "business-like efficiency" in public organizations have shaped ideas about education governance during this era (Bauman 1996). As a result, the education bureaucracy grew during this period, before several concerns regarding the prevailing belief in scientifically managed bureaucracies were raised.

Bureaucratic organizations have the advantages of rules and laws regarding meritocracy, division of labor and specialization of duties, and a formal chain of command and authority. The organization of schooling in the United States follows a type of hierarchy and uses division of labor involving education agencies, school districts, and schools. The schools are managed by trained administrators, and the courses are offered by certified teachers. There are federal and state level statues and rules that the school systems should follow. Students are divided into grades based on age and assessed and credentialed by standardized methods. When an organization manages routine matters involving or affecting a large number of people, a bureaucratic structure may provide a technically efficient form of organization. However organizations that provide public services such as education are inherently different than a business that pursue technical efficiency in production, so the subsequent periods in the history of American education have been shaped by a variety of conflicts and changes. Scholars of education and education history have documented social and ethnic inequities in access and violations of civil rights that the bureaucratic efficiency models did not address (Hannaway and Carnoy 1993). Scholars of public administration and political science raised concerns about the possibility of an administration-politics dichotomy in public organizations (Svara 2001) and the inherent differences between government and business (Stone 1997). Government serves citizens and voters, not buyers, sellers, and producers. Not everything of social value is profitable, and government engages in those activities to fill a need. Finally, since governments serve a very diverse citizenry with diverse needs, it is not easy to measure inputs and outputs of government activity. Public schooling provides a clear case for these tenets.

## Education as a Neglected Field in Public Administration Scholarship

Public education has often been a neglected area in public administration scholarship. An examination of textbooks, journals, books, curricula, and professional association activities found 17 articles focusing on public education in the 5 leading journals in the field of public administration in the 3-year period preceding the analyses (Raffel 2007). One of the more active areas of education research in public administration gave emphasis to schools as bureaucratic organizations to examine questions of representative bureaucracy. The theory of representative bureaucracy suggests that a bureaucracy representative of the public it serves will result in a more representative decision-making process (Meier and Bohte 2001). Since school systems employ a great number of public workforce, data from school systems were used by public administration scholars to study hypotheses regarding representative bureaucracy. For example, Meier et al. (1999) pooled data from 350 school districts over 6 years to examine the relationship between representative bureaucracy and percent of students who passed state-level tests per district. Bureaucratic representation was operationalized as the percentage of black and Latino teachers and pass rates for minority and nonminority students were used as the dependent variables. Their results have shown that both minority and nonminority students perform better in the presence of a representative bureaucracy, implying that the representative bureaucracies are more effective than nonrepresentative bureaucracies. Meier and Bohte (2001) used the same data set and same variables but differentiated between passive and active forms of representation in school bureaucracies, by introducing the concept of discretion. They proposed that wider spans of control allow greater line discretion and used two ratios at the district level to measure two spans of control – the ratio of teachers to principals and the ratio of campus-level administrators to central office administrators. They found that student performance improved under organizational structures that promote teacher discretion. The research on bureaucratic representation in schools continues. In a more recent paper, Grissom et al. (2015) introduce the theory and its hypotheses to education researchers and call for further applications to study additional schooling outcomes such as discipline, special education, and achievement.

Representative bureaucracy research in the context of schooling contributes to our understanding of the dynamics of race, gender, and other characteristics within schools.

## Reforming School and System-Wide Governance

Education governance and emphasis on bureaucracy are central to school reforms after the 1990s. Governance is about power and decision-making in both formal and informal systems, in other words, how society or groups within it organize to make decisions. In public sector organizations, governance is typically defined in formal bureaucratic terms. One of the main issues that incite criticism of the public schools has been the bureaucratic nature of their governance structure. Education reform efforts relying on market-based schools of choice and site-based decision-making aim for fundamental changes in traditional school bureaucracy and system-wide governance.

The proposition that bureaucracy is the culprit of problems in education system refers to bureaucracy in its colloquial negative connotation. According to this line of thought, rules and regulations around school systems are excessive, rigid, and damaging to the autonomy of teachers (Chubb and Moe 1990). Furthermore, these critics claim that hierarchy obstructs innovation and reduces responsiveness, because teachers and administrators become preoccupied with "satisfying artificial standards rather than serving the needs of their students" (Hoy and Sweetland 2001, p. 300). They reason that large bureaucracies have negative effects on educational performance. This canon is often used by public choice theorists, who primarily rely on economic tools for analyzing political behavior and institutions. Such advocates of school choice believe that businesses are innovative and responsive to their clients because they operate in the marketplace and are not subject to the bureaucratic burdens. Consequently, the primary solution offered by these critics is to treat education provision as a market and to introduce competition via school choice to circumvent bureaucracy (Chubb and Moe 1990). Generally this choice involves publicly funded charter schools or public-money voucher programs for private schools.

The idea of bureaucracy as the problem and competition and choice as solutions is challenged by scholars and theorists who claim that the main culprit for problems in the education system is funding inequities among schools or broader socioeconomic problems in the communities the schools serve, rather than bureaucratic nature of education institutions (Smith and Meier 1994; Krueger 1998). In public administration scholarship, Smith and Meier (1994) and Bohte (2001) specifically examined the influence of bureaucracy on the educational performance of public school students. Using state-level data, Smith and Meier (1994) operationalized state educational bureaucracy as "the number of state bureaucrats per 1,000 students" and the school district bureaucracy as "the ratio of central district administrative staff per 1,000 students" (p. 554). Three measures of system-level performance were "percentage of adults aged 25 or older in a state with a high school diploma," scores from "the US Department of Education's eighth grade math exam," and "the average ACT or SAT score of high school seniors" (Smith and Meier 1994, p. 553). They did not find support for a relationship between bureaucracy and school performance. Larger state bureaucracies reduced local district bureaucracy, and increases in state funding were associated with increases in district personnel, suggesting that the growth in educational bureaucracies might be due to the growth in need and governmental responsibilities. Furthermore, teacher's involvement in bureaucratic tasks reduced student performance. They interpreted increasing administrative burdens on teachers and its negative influence on student performance as a potential detrimental side effect of reducing education bureaucracies.

On the other hand, using school district-level data from the State of Texas, Bohte (2001) found an inverse relationship between bureaucracy and school performance. In this study, bureaucracy was operationalized first as "the percentage of

central administrators as a fraction of total full-time district employees" and then as "the percentage of campus administrators as a fraction of total full-time district employees." Performance was measured by student scores on state's standardized tests. Bohte (2001) was cautious about making hasty policy prescriptions to eliminate school bureaucracies and called for further research to examine the role of bureaucracy in shaping different dimensions of school performance. Subsequent research attempted to explain the complicated relationship between school bureaucracy and school performance by complex task environments of schools (Smith and Larimer 2004). According to this line of thinking, similar to other public organizations, schools have multiple and often conflicting goals. Consequently, the relationship between bureaucracy and performance depends on the particular measure of school performance used. While bureaucracy can be negatively associated with test scores, it can be positively associated with other performance measures such as attendance or dropout rates (Smith and Larimer 2004).

## Conclusion

School systems have the classical bureaucratic properties, such as task specialization, hierarchy of authority, objective standards and impersonality, and rules and regulations, as described by Weber (1947). Bureaucracies have multiple goals and both positive and negative connotations for the school system. While some think of school bureaucracies as rigid, slow, alienating, and limiting, others emphasize their advantages in clarifying responsibility and focus on competency and impartiality. Hoy and Sweetland (2001) attempted to reconcile the two conflicting views by differentiating between two bureaucratic structures based on dimensions of formalization and centralization. They use the term "hindering bureaucracy," when referring to an organizational structure in which formalization and centralization coerce and hinder problem-solving and decision-making. When the rules, regulations, and procedures are helpful in problem-solving and the employees participate in decision-making, the resulting structure is referred to as an "enabling bureaucracy" (Hoy and Sweetland 2001, p. 301). Characteristics of enabling formalization such as interactive dialogue and trust typically occur in organizational contexts that feature employment security, professional perspective, and employee participation. Characteristics of enabling centralization involve cooperation and flexibility. In other words, both hierarchy and rules should be used to create school bureaucracies that support teachers and guide problem-solving.

# School Feeding and SDG Implications: A Stakeholder-Based Study

Vincent Ekow Arkorful
Department of Government and International Studies, Hong Kong Baptist University, Kowloon Tong, Hong Kong

## Synonyms

Ghana; School feeding and education; Social protection policy; Stakeholder-based study; Sustainable development goals

## Definition

School feeding refers to a social policy intervention vehicle incepted to extend social protection to children of school-going age from under-resourced or resourced challenged backgrounds.

## Introduction

The primacy placed on advancing citizens welfare around the globe has gained prominence in recent times. This situation has informed the need to pursue state development essentially steeped in, and converging around a more elaborate protectionist and welfarist principles and tenets. Within Africa, and more particularly in Ghana, communal orientation nature of the society has established the family as an unfailing fountain of a diversified social support. The onset of globalization and westernization has however dispensed lethal consequences, precipitating the submergence of the family structure. The deleterious ramification thereof has negated the once potent capacity of the family as a super social structure. To this end, the family has consequentially relapsed into a comatose. It is the convergence of these situations that have spurred the exertion of efforts toward the transfusion of social policies in developing countries including Ghana. In this regard, responding appropriately with a sustainable mechanism to fill the void brought into vogue social protection policy as an efficacious development centered conduit.

One manifestation of the global commitment to social protection is ingrained in the erstwhile United Nations championed Millennium Development Goals (MDGs), larger parts of which sought to promote social services access while bridging inequality gaps. Regarding the MDGs, as much as considerable inroads were made, the challenges encountered substantially impaired progress as well (Sachs 2012; Ruhil 2015). Ghana, for instance, realized the poverty goals before the 2015 deadline. Nonetheless, poverty still remains pervasive, more especially in the Northern parts (NDPC and UN 2015). Moreover, the global progress notwithstanding, sustainable development pursuits remain challenged such that, poverty, deprivation, and inequality continue to spiral, while wealth and power disparities widen simultaneously (Alshuwaikhat and Mohammed 2017).

On this basis, the unappealingly malnourished outcomes seem to have informed the design and deployment of a much broader and robust global

policy framework to guide a people-centered development engagement. Consequently, a transformative development blueprint – the Sustainable Development Goals (SDGs), among other things targeted at less burdening the challenges of the venerable by the year 2030 was implemented in 2015 (Independent Commission for Aid Impact, 2017). The SDGs are directed at complementing and reinforcing the inroads made under the MDGs. Within this context, policies are enjoined to expend efforts and resources to: eradicate poverty (Goal 1), pursue zero hunger (Goal 2), ensure quality education (Goal 4), and promote gender equality (Goal 5). In realizing these, as well as the other goals, the research construes education as a common string that could be used to hold and tie these goals together.

In the face of the relevance of education to developing a resource-rich pool of humans to champion development efforts in countries, the urgency to countervail education-based challenges such as low enrolment and retention as well as poor nutrition in under-resourced settings culminated in the design and introduction of the school feeding program as an efficacious policy (Bundy et al. 2009; Iddrisu 2018). Increasing enrolment, attendance, and retention while eradicating poverty and hunger underpins the proximate reasons for the school feeding program institution (Fiske 2000). School feeding programs around the world have been modeled to distribute food to school-going children in deprived settings, with the underlying assumption that, hunger among children of school-going age demotivates. For that matter, unfed and/or poorly fed children develop poor cognitive strengths, thereby affecting not only the learning processes but also the overall educational outcomes (Essuman and Bosumtwi-Sam 2013; Gumus 2014).

With the implementation of the school feeding program, enrolment, attendance, and retention at the basic level of education in Ghana increased. Attrition levels have been reduced to the barest minimum in beneficiary schools (Iddrisu 2018; Iddrisu et al. 2019). Given the global goal of "ensuring inclusive and equitable quality education and promoting lifelong learning opportunities for all," as enshrined in the SDGs, it is obvious that, interventions meant to improve education quality, effectiveness, efficiency, and excellence cannot be entirely be divorced from social policies like the school feeding program. Prior studies on the school feeding program have exposed heterogeneous findings and policy concerns. A study by Galaa and Saaka (2011), underscored policy lapses regarding a dearth of stakeholder participation. In another study investigating the efficacy of the school feeding program, Iddrisu et al. (2019), also espouses policy deficiency of the program, specifically relating to a disconnect between the policy, policy implementers, and stakeholders. This is a confirmation that, inextricably interlocked, and anchored in policy efficacy lies stakeholder roles.

In the face of the relevance of the school feeding program, the reported policy deficiencies as captured in the peripheral stakeholder involvement, vis-à-vis the challenges encountered in realizing the erstwhile MDGs, all against the urgency to realize education-related SDGs, the paper conducts a stakeholder-centric diagnosis of the school feeding program and possible implications. Using the Ghana Living Standards Survey (GLSS) Round 7 report, the study samples poverty endemic beneficiary areas, and through interviews and focus group discussions (FGD), gather stakeholder perspectives on the school feeding program. The choice of the study areas is informed by incidence of poverty and inequalities. This study will guide policy actors in deploying pro-poor social protection policies.

## Study Background

Ghana's school feeding program was incepted under the John Agyekum Kuffour-led New Patriotic Party (NPP) government, under an African Development Bank (ADB) comprehensive program initiative. Prominent among the goals of the program tailored in line with the UN's MDG's was the urgency to eradicate hunger, poverty, and malnutrition. The program was finally implemented by the government of Ghana, in concert with the Dutch Government (Bundy et al. 2009). The implementation of the program

was preceded by a three-phase pilot study in 2005. The first stage of the study, from 2005 to 2006, covered 64, 775 school children. The successful piloting was followed by a scale-up second phase (2007–2010), which covered 413, 498 students. The final phase of the scale-up spanned from 2014–2016 and covered 1,728, 682 school children (Ghana School Feeding Agency 2016). In response to the need to increase coverage, the school feeding program was expanded.

Hunger has been identified as an unfortunate barrier to education. This situation is particularly true for school-going populations in poverty-stricken jurisdictions around the globe. In the study settings where poverty levels range from as low as 26.8% to as high as 70.9%, the extension of the school feeding program in these areas is not only appropriate and convenient, but also indispensable. This however said, there exist nagging policy deficiencies that have impaired policy efficacy. From the perspective of the research, these challenges, when not addressed appropriately may have debilitating ramifications for long-term education, social policy, and overall national welfare and development.

## Social Protection, School Feeding Program, and Stakeholder Involvement

Against the backdrop of the logic undergirding the theory of social contract by Hobbes as cited by (Wolff 1994), the reposition of trust in government by citizens establishes a contractual obligation between these two entities. In this case, the people, or group of people, in whom such trust is deposited must endervour to deliver accordingly. Social contract in this case refers to an agreement struck between citizens and authorities, for the purposes of self-protection and preservation. In this respect, the reposition of trust in government by citizens, enjoins the lead (thus government), to advance courses targeted at advancing general economic well-being of the led (thus, citizens). One of the possible ways to pursue this course could be through the implementation of social protection policies and programs.

Social protection essentially revolves around measures instituted to advance the course of the downtrodden in the society (Fiszbein et al. 2014). In the views of Slater (2011), social protection is conceptualized as a framework mechanism deployed to reduce inequality while eradicating poverty. School feeding as a social protection program is meant to transform the living conditions of populations of school-going age caught in the web of poverty and social exclusion (Adato and Bassett 2009). Given that the school feeding program has saved millions of populations across the world, it is reasonable to infer that the efficient deployment of such programs could inform the dwindling of global poverty (Fiszbein et al. 2014).

At this point, given the human resource shortages that has saddled and ended up snail-pacing development in under-resourced polities, it is significant for state actors like government entities to place an appreciable modicum of priority on schemes that have the potency to harness these human resources. Further, considering that human development efforts cannot be totally situated outside the precincts of the enterprise of education, it becomes crucial that social protection schemes like the school feeding is driven to enhance school attendance, enrolment, and retention.

Driving social protection program outcomes requires stakeholder involvement (Galaa and Saaka 2011; Gabriel and Harcourt 2012). The school feeding program is no exception in this regard. Stakeholder participation essentially drives program robustness and efficacy. Abotsi (2013) in a seminal study corroborates the significance of stakeholder involvement. Mirtcheva and Powell (2009), Sonnino et al. (2014), Khatete et al. (2013), Veloso (2014) also posit that stakeholder participation enhances program sustenance. In view of the centrality of stakeholders' participation in ensuring program success, all against their peripheral roles in the program (Iddrisu 2018), this study interrogates stakeholder perspectives regarding Ghana's school feeding program.

## Methodology

### Research Approach and Design

The study sought to explore various stakeholder perceptions, experiences, and understanding regarding the school feeding program in Ghana. The study employed the Inductive and interpretivist approach because of its appropriateness for context-dependent discourses (Madill et al. 2000). The epistemological component of interpretivism emphasizes on subjectivity of knowledge while the ontological aspect emphasizes on the fact that individual experiences and understanding about a phenomenon differs across persons (Creswell 2013). The study employed the qualitative study approach to enhance a better understanding of the complex variegated stakeholder perceptions and experiences (Creswell et al. 2007). Precisely, the phenomenological approach is appropriate for understanding lived experiences of participants (Zikmund et al. 2013). Therefore, the study used a qualitative phenomenological approach premised on interpretivism and inductive reasoning. The study employed thematic content analysis to present themes captured in interview transcriptions relative to perceptions and understanding of the school feeding scheme. This approach was to provide insights, knowledge, and also enhance a reexamination of responses (Elo and Kyngäs 2008).

## Population and Sampling

### Participants and Sampling

Using a purposive sampling technique, a total of 270 participants were recruited from two (2) randomly selected districts in five (5) regions. These study regions were selected with recourse to the Ghana Living Standards Survey Round Seven (GLSS 7) (Ghana Statistical Service 2018). Study participants comprised of teachers (100), students (50), circuit supervisors (20), community opinion leaders (30), caterers (20), and parents (50). The study used a large sample because of the need to avoid error while comparing and contrasting responses to establish their valid inferences. Study participants were from heterogeneous group, ages, and genders. The demographic characteristics of study participants are captured in Table 1.

## Data Collection

The study used a semi-structured interview guide to elicit data. Participants were interviewed on an

individual basis. Also, to enhance gathering further information, the study held focus group discussions (FGDs) with participants in each district. In all, ten (10) FGDs were conducted. The FGD was made up of participants (Table 1). The interview was conducted in line with the recommendations of McCracken (1988). For purposes of categorization of responses, and thematic analysis, long interview sessions were maintained. In establishing the credibility of the interview guide, the instrument was reviewed by two academics and two researchers with expertise in qualitative education-related research. Prior to data collection, a pilot test was conducted among a randomly sampled population in one of the study areas, after which the research questions were revised according to panel recommendations and results of the pilot test. The questionnaires were thereafter submitted to the team of academics and researchers for approval. Interviews lasted for approximately 30–40 min. Data collection started on 4 September and lasted till 15 December. The data collection steps and timelines are captured in Fig. 1. The long interview sessions allowed participants to express their views freely on meaningful issues with the research team (Creswell 2013). In order to facilitate follow-up from the larger sample of study participants, the research team established rapport by posing mini and grand tour questions regarding the subject matter under investigation. Essentially, while this ensured that researchers remain unobstructive, it also ensured that, participants remain focus and not deviate from the discourse (McCracken 1988).

## Data Analysis

The study used thematic analysis to analyze qualitative data. This approach enhances the identification, analysis, and report patterns in line with themes within the confines of drawn data (Braun and Clarke 2006). Audio-recorded data were stored, retrieved, and managed from a password protected folder on an Apple-branded laptop of the research team. After recording, responses were transcribed verbatim after which they were read over and over before the contents were highlighted and categorized into semantic parts. In this regard, transcripts were read line by line. Each line containing semantic meanings were assigned codes to help identify maximum number of possible codes in order to facilitate easy verification. After familiarization with data, initial coding was done. This helped in identifying the main themes. The themes were subsequently reviewed and the final themes were developed. In ensuring thoroughness, honesty, and data integrity, due care was observed. In treating data, anecdotes narrated were not integrated. Furthermore, in ensuring transparency, and capturing the narratives of study participants, rather than researcher's partial interpretation of responses, researchers were cautious of misinterpretation. Interview analysis was done with the help of the research assistants. Two other academics, who did not participate in conducting the interviews, independently validated the response analysis. This ensured that the results were reliable and valid (Mason 2002), clear (Richards 2009), fair, and devoid of bias. Therefore, they were

representative, and grounded in the expressed views of the respondents.

## Findings

As much as the narratives of study participants confirmed the efficacy of the school feeding program, it also revealed a litany of lapses, which in the views of stakeholders who constitute the focus of the study, could hamper the achievement of the objectives informing the institution of the program. Analysis of data revealed five themes converging around; (a) structural rigidity of the school feeding operational structure without recourse to decentralization targeted at absorbing relevant stakeholders. For instance, given that the operational structure does not make space for stakeholders like teachers and community members who are essentially central actors in so far as education and other related programs (e.g., school feeding program) are concerned, the sidelining of stakeholders to the periphery has impaired the efficacy of the policy; (b) a dearth of poverty consideration guiding policy deployment. In the views of almost all stakeholders, the prevailing situation whereby children of school-going age in poverty endemic areas do not benefit from the program has the tendency to hamper the goal of using school feeding as a conduit to increase enrolment, attendance, and retention in schools; (c) Involvement of political functionaries. In the views of some stakeholders, the school feeding program as a social protection program for the vulnerable in the society has ended up as a tool in the hands of politicians who use it to award loyalty. Taking a neck turn to the operations of the policy and the realities on the ground with the intention to address lapses entangling the program would provide a sound basis for reformation; (d) delays in fund disbursements. Because this has been the situation, caterers, on some school days, are unable to provide food for school children. This situation has the potency to militate against the attainment of the core objectives of the school feeding program; (e) bribery and corruption. This development has been precipitated by the delays characterizing fund allocation to caterers. Under these circumstances, to facilitate the quick processing of repayments, caterers are forced to bribe program officers. This has contributed to the festering of bribery and corruption. Discussed in details below are the themes echoing the responses of participants.

### Responses from Caterers

The caterers are responsible for providing feeding services to the school children. Given the sensitive nature of the subject matter under investigation, most of the caterers contacted were not willing to participate. They had the perception that they were under investigation. With this erroneous notion, they believed releasing information to the research team may cause them to lose their contract. However, upon several visits and follow-up they agreed to participate. From the series of field visits, our interaction with caterers revealed a plethora of challenges. The key among them includes a dearth of cooperation between them and other stakeholders like the community members, opinion leaders, and teachers. In the views of caterers, because they are not considered integral parts of teaching system, teachers and the administrative system do not recognize them. In this regard, caterers ascribed the difficulty in serving school children to the lack of recognition and cooperation. In recounting experience on this, a caterer said:

> "Most of the teachers don't see us to be part of the school. Maybe it is because we are not teaching"

Another stated:

> "Some members of the school staff see us as external agents brought in to provide profitable service. With this thinking, they think it's not part of their business to help in food sharing. And after all, teachers are not beneficiaries, so they don't care"

From the responses of caterers, it became apparent that the program is resource-challenged. Almost all caterers expressed the view that they always have to pre-finance their activities and later submit proofs for refund. In this same regard, it was also revealed that even after submitting proofs of expenditures, refund takes longer than reasonable time. Others also shared the opinion that, sometimes, before refunds could be accessed

they have to bribe officers in charge to expedite processing. Some said the following:

> "Initially when the programme started, resources were flowing regularly, but now we have to pre finance and be reimbursed"

Another said that:

> "Sometimes we take loans to finance the projects. Some of these loans are offered at high interest rates. And we need to repay. So, to get the money quickly to repay creditors, we have to bribe officers to process benefits for us. This is no secret"

> "Even when the funds are in, to expedite processing, we have to put something in envelope for the officers in charge. If you don't do, you don't get the money early"

Our interview further revealed that, after being awarded the contract to provide food services, they are only introduced to the head teachers, who are the administrative helmsmen of the school structure. In their views, this could be one of the key reasons why most teaching staff members do not cooperate with them. To remedy the situation, they suggested that, upon award of contract, the contract awarding institution should introduce caterers to the school structure, and other ranking members like circuit supervisors, teaching staff members, circuit supervisors, community leaders, opinion leaders, school management committee members, and other officials. A caterer said that:

> "We cannot blame the teachers for not cooperating with us. They don't know us. And it is because we are not introduced to them. So how do they work with us? In what capacity do they work with us when we are strangers?"

For the reason that the school feeding is very cardinal to increasing attendance, enrolment, and retention, the cooperation of these stakeholders is very essential when situated within the context of human resource development, particularly as relates to the SDGs. The high esteem in which teachers are held underscores the pertinence of their cooperation to the success of the program. Also, considering that opinion leaders – mostly community leaders – are considered as authorities, custodians, and, as such, symbols of community representation, their cooperation becomes very cardinal. This study results are consistent with (Bundy et al. 2011; Bundy et al. 2009) who ascribed the success of the World Food Programme (WFP) across the world to teacher and community stakeholders' cooperation.

### Responses from Teachers

Teachers who participated in the study were very vocal and assertive in sharing their perspectives on the school feeding program. Generally, our interaction revealed a general apathy. Teachers did not see themselves to be part of the program. Almost all participants indicated that their inputs were not sought on what to be cooked for school children. As such, they see no essence in liaising with caterers to ensure program success. Regarding the roles of the teacher in so far as the program is concerned, most teachers were of the view that their role has been reduced to providing figures on enrolment. In bemoaning the state of affairs, a teacher said that:

> "We are only contacted when figures are needed on enrolment. Apart from this, our inputs are not and never sought on anything regarding the programme"

Another said that:

> "Though we are teachers, we have no idea about what goes into the programme. As to who decides what, when and how, we don't know. But at the end of the day, when the kids eat the food and have challenges, parents come and question us"

On the provision of enrolment figures, almost all teacher participants demonstrated signs of distrust regarding the submission of list to the appropriate authority. Furthermore, because of the communication gap, which has further engendered a disconnection between stakeholders, teachers regard stakeholders, like the caterers, as outlier entities. The following responses echo the concerns of teachers:

> "As teachers, we are not responsible to caterers. We are responsible to direct communications and other issues to headteachers. The school structure binds us to the headteacher. So, we can't entrust caterers with official document"

### Responses from Circuit Supervisors

Central to the Ghana Education Service (GES) structure lies circuit supervisors (CS).

Considering the impossibility of the GES maintaining presence at all levels of the educational structure, the role of the circuit supervisor has been created to fill in any supervisory void. The CS, among other things, are responsible for exercising oversight responsibility over enforcement of, and compliance with, laid down teaching rules and regulations. Our interview sessions with circuit supervisors revealed that they had no space within the program. This confirms the sidelining of an indispensable stakeholder. Almost all the CS interviewed shared same concerns. Some stated that:

> "Circuit supervisors have nothing to do with the programme. Our duty is to supervise teachers and not feeding programmes"

> "How do we participate in programme when it is not under control of the Ministry of Education. Our offices are different. There is no significant point of convergence in so far as these entities are concerned"

Discoursing on this pertinent issue with circuit supervisors indicated a disjuncture in coordination between stakeholders. According to our investigations, the policy, until the recent shift to the Ministry of gender and social protection, was under the supervision of the Ministry of Local Government. The vacillation of the program supervision from one ministry to the other, in the views of these stakeholders could undermine the program entirely. Also, having the program situated in the upper echelons of government and its affiliate outfits precludes the involvement of stakeholders like teachers and circuit supervisors. The rigid operational structure of the school feeding, without recourse to decentralization consideration, has left these stakeholders on the fringes.

### Opinion Leaders

Opinion leaders, within the precincts of this research, refer to people with the recognition and authority in the study areas. They comprised community leaders, traditional leaders, leaders of religious bodies, and other occupants of relevant social positions as determined by the social structure of the study areas. The dignified position that these groups of persons occupy within the community structures make them very important subjects worthy of engagement for studies of this nature. While it is important to state that some of these opinion leaders serve as members of the school management committees of the schools sampled for the study, it is also important to state that their roles in the school feeding program however remains unclear at best, and a peripheral one at worst. Our interaction revealed that most of the opinion leaders are uninformed about the program. According to most of the opinion leaders, apart from what they observe on their regular visits to the schools, there exist no official communication between them and other program managers. In pouring out their frustration, some of the participants said that:

> "We have no idea about what goes into this programme. All we know is that, they cook for the school children. We have no stake in this programme".

> "The only time we got ourselves involved in the programme was at a time when we were told some community members had attacked the caterer and other workers. That's all."

Another said that:

> "We are not recognised to be part of the programme. We have got nothing to do with the programme."

> "Though it's in our community, we have no ownership of it. It's for the caterer. She is supposed to serve food to our children in the school"

Though most of the opinion leaders stressed on their noninvolvement in the program, some of the very few who had fair knowledge about the program shared insightful views with the research team. Some of the frustration shared bordered on delays on fund disbursement to caterers and bribery and corruption. This response essentially resonated with the experiences shared by most caterers. In this regard, an opinion leader stated that:

> "There was a time the school children in my house came home and complained that, they were not served food at school. When I made a follow up to the school the next day, the caterer complained, even after investing her money into feeding, she had not received funds from the programme managers"

Another emphasized that:

> "I have nothing to do with the programme though, but the caterer happens to be my good friend. I can share some of the frustrations they have had to go through on daily basis. They are not regularly given funds. And sometimes, caterers would have to bribe officers to have their refunds processed timely and quickly"

Also, some opinion leaders went further to share interesting views regarding the school feeding program. In sharing frustrations about the difficulties school children go through, and the need to seek for sustainable interventions to save the situation, some opinion leaders recounted narratives of the steps they undertook before the designation of some schools in their areas as beneficiaries of the program. Other opinion leaders also raised questions about the criteria for the selection of beneficiary schools. Some of the participants engaged shared the following views:

> "Before some of the schools were selected as beneficiaries, we had to pass through the member of parliament whose government was in power to lobby government authorities to give us the school feeding programme package"

Another said that:

> "I have been thinking about something for some time now. Our area is a poverty endemic area, with vulnerable populations. These are the areas that the government should focus on giving social protection programmes like the school feeding programme.

The responses of the opinion leaders essentially revealed grave policy lapses regarding the implementation of the school feeding program. Therefore, it is important for program managers and policy makers to focus much on poverty considerations. There is also the need to put in place institutional mechanisms that would prevent the involvement of political actors in the program.

### Responses from Parents

Parents as stakeholders of the education system, and as such the school feeding programme, were not left out of the study. By virtue of their relevance, the study sought for their view on the study. Their responses essentially contributed to enriching perspectives on the subject matter. Our interaction with parents revealed nagging challenges that had plagued the program. Most importantly, their responses resonated with the issue of delay in the allocation of resources and the need for the integration of poverty considerations in determining beneficiaries. Our interaction elicited the following responses:

> "Sometimes, when the kids go to school, they are not offered food. When we inquire, we are told the caterer doesn't have enough resources because government has not allocated enough for feeding"

Another also stated that:

> "There was a time the school children were not fed for a whole week because the caterer did not have enough food to feed the children. This was a problem for us parents. We are poor people here. We don't have enough money. Government should consider our poverty and supply the caterer food to cook and feed our children. Somehow, the feeding helps us."

### Responses from School Children

Situated at the center of the school feeding program are the school children. They are the recipients of the service provided. As such, the study considered them as relevant to the subject matter under investigation. The interaction with students indicated that the delay in the allocation of resources to provide food for school children renders the program ineffective, such that whenever there is no food for the school children, they go hungry and get discouraged to attend school in the days ahead. Our interaction brought up the following responses from school children:

> "The school feeding is good. But there is a problem. Sometimes we come to school but there is food for us. If they don't give us food, we have to stay in school for the whole day without food"

> "The last time, they did not give us food. When we asked, they told us that, government did not bring money to cook food for us. It has happened so many times. We suffer when there is no food for us. Government should help us. We are poor children. If there is no food in school, we have to stop school and go to work in the farm to get money and buy food."

Another stated that:

> "When we come to school and they don't give us food, we don't feel happy to stay in school. And we don't want to come to school the next day because we think we will not get food"

These responses underscore the fact that, feeding is a motivation for school children. It also shows that the availability to food can draw children to school.

## Discussions

Social protection policies, specifically the school feeding program, has over the recent decade been increasingly touted as an important component of educational structures – as it contributes to increasing attendance, enrolment, and retention in schools. The present study contributes to literature by presenting and elaborating on stakeholders' perceptions and understandings of the program. The study reports and discourses on the findings, alongside their respective significance and implication for the overall program effectiveness and efficiency.

Firstly, as captured in the study participants' responses, the results revealed that the obviously rigid structure of the school feeding program does not make it receptive enough for the participation of stakeholders like teachers, opinion leaders, among others. Essentially, the deep-seated occupation of political structures like the local government authorities (e.g., district assemblies), the ministries (e.g., Ministry of gender and social protection), and other high offices like the office of the president has opened opportunities for politicians who are always bent on grabbing and manipulating social protection policies for ulterior objectives like winning political votes.

The prevalence of this situation does not make enough germane space for participation of low-level bureaucrats like teachers. Nudzor (2013), in a study of free basic education and school feeding program implementation confirms the institutional structure effects of programs on success or otherwise. In a separate study, Iddrisu (2018) contends that, regarding the school feeding program, the low-lying position of stakeholders like teachers has dealt a debilitating impact on the functions of other stakeholders. In prescribing a policy panacea, Iddrisu et al. (2019) posits that the widening of the program structure, and the subsequent integration of other stakeholders, is likely to break the dominance of high-level bureaucrats like politicians, and further create sufficient operation space for other indispensable stakeholders like teachers and opinion teachers.

Secondly, consistent with, Iddrisu et al. (2019), our study further revealed major lapses regarding the dearth of poverty consideration guiding the deployment of the school feeding program. This finding, as captured in the responses of stakeholders, has the tendency to neglect the poor who are supposed to be the real beneficiaries of the program. The issue of the dearth of poverty consideration bedeviling the program becomes more palpable when comparing statistics on regional poverty prevalence figures with percentage of basic schools under the school feeding program. The regional statistics on percentage of poverty incidence in the year 2016/17 indicated that the Northern Region had 61% poverty incidence, Upper West Region (70.9%), Upper East Region (54.8%), Brong Ahafo Region (26.8%), Volta Region (37.3%), Ashanti Region (11.6%), Eastern Region (12.6%), Greater Accra Region (2.5%), Central Region (13.8%), and Western Region (21.1%) (Ghana Statistical Service 2018).

On another breadth, the regional percentage distribution of basic schools under the school feeding program for same period are as follows; Upper West Region (90.43%), Upper East Region (56.67%), Brong Ahafo Region (37.28%), Northern Region (31.33%), Volta Region (28.59%), Ashanti Region (43.57%), Eastern Region (24.28%), Greater Accra Region (59.72%), Central Region (21%), and Western Region (27.21%) (Ghana School Feeding Agency 2016). Essentially comparing the northern region, which has 61% poverty rate and 31.33% of basic school covered under the program, with Greater Accra and Ashanti Region who have 2.5% and 11.7% poverty rate and 59.72% and 43.57 of basic schools under the school feeding program confirms the study findings.

Moreover, a juxtaposition of the Upper East and the Greater Accra Region, in respect of the percentage of poverty rate and percentage of schools covered under the school feeding program equally confirms inequity, indicating that the determination of program beneficiary actually does not follow a clear-cut pattern focusing on the vulnerability of populations. The dearth of

poverty consideration saddling the program implementation violates the programoperational framework. This constitutes a distortion which can deny vulnerable populations a fair share of the national cake that they are inalienably entitled to.

Another important finding of this study bordered on the involvement of political functionaries in the affairs of the program. Interaction with participants underscored the fact that some schools gained beneficiary status through the influence of political actors like members of parliament who lobby incumbent governments for their share of the program. Upon interrogation, this appeared possible because of the central position of government structures like the District Assemblies, which are helmed by appointees of the incumbent president, who in essence is a politician elected through a keenly contested election.

For this reason, people with loyalty and allegiance to the party of the government in power perceive government initiatives, including social protection programs as an entitlement. This finding is in tandem with Arkorful et al. (2019) who confirm the likelihood of government interferences in the implementation of social protection programs. Arkorful et al. (2019) contend that the onset of political tendencies in well-meaning social protection programs targeted at cushioning the destitute in the society may cause not only discrepancies but also entrench inequities, which may further have dire ramifications for the realization of SDGs. This is a confirmation that state sponsored social protection programs could be deployed as a tool for gaining political capital (Iddrisu et al. 2019; Arkorful et al. 2019).

Besides, in congruence with prior studies exploring stakeholders' understanding and perceptions regarding social protection policies in developing countries, our study revealed that caterers undergo series of stress, which tend to affect the efficiency and effectiveness of program goals. In this study, we found that there are occasions that caterers are not given funds to provide food for the school children. They are rather asked to pre-finance and later be repaid. Given this situation, caterers are compelled to take loans from friends, relatives, and sometimes from other financial institutions who charge throat-cutting interest rates.

These caterers are bound to comply with repayment obligations. In a situation whereby caterers are short of sufficient resources, they are unable to provide school children food. As such, school children go hungry. Under this circumstance, school children are discouraged from attending school. If this challenge is not resolved, it may compound to defeat the purposes for which the program was instituted. The negative impact of fund delays regarding social protection programs, as revealed in this study, is significantly highlighted and confirmed by (Kamaludeen 2014; Abebrese 2011; Arkorful et al. 2019).

The delays in fund disbursement have further created a fertile ground for the festering of bribery and corruption. Because caterers are not allocated funds to provide feeding services, for which reason they take financial assistance from individuals and financial institutions, they are always under pressure to file claims for repayment. In doing so, to get the claims processing expedited, caterers pay some amount of money to program managers. The susceptibility or vulnerability of social protection policies to corruption is in conformity with WFP (2013). Salvaging the situation calls for the design of mechanisms to facilitate the receipt of complaints from other stakeholders like caterers. This could also be complemented by devising strategies that would help track the flow of resources, (for instance funds) from the fund managers, down to the designated recipients. To this end, it could be concluded that, as much as the government of Ghana has exerted strenuous efforts to incept a social protection scheme, there is still the need to strive to sustain an efficient program that would inure to the benefits of Ghanaians.

The study has some strengths that require to be illuminated upon. In the first place, it is one of the few seminal studies that provides evidence from a diverse stakeholder perspective regarding the school feeding program in Ghana. Secondly, the presentation of data and varying viewpoints of stakeholders central to the program makes it

unique. On this basis, the study enhances an appreciable depth of comprehension from the various perspectives while advancing mechanisms for addressing program and policy gaps. Moreover, the findings of this study could provide sufficient policy pointers for guiding future policy design and implementations. At the same time, the findings could help in troubleshooting prior to social policy implementation.

Our study has limitations by virtue of the method employed. Owing to the restriction of the study in ten randomly sampled districts of five purposefully selected regions, based on poverty incidence reported by the GLSS 7, the study results should not be regarded as representative of other regions in Ghana. And though the study assigned much priority to the depths of participants' experience, the replication of the study findings must be done with caution. These limitations do not in any way invalidate the results of the study.

## Conclusion and Recommendations

The school feeding program as a social policy program has been touted around the globe as an efficacious initiative employed by polities to remove all restraints regarding school attendance, enrolment, and retention. Because this has been the case, and more especially given the safety net, the policy extends to the vulnerable and underprivileged populations in resource deficient polities, it could be asserted that central to the efforts to realizing SDG 4, it is likely to preoccupy the attention of stakeholders. The school feeding program, which guarantees school children of at least one meal a day, has contributed to improving school attendance in countries (Veloso 2014; Iddrisu 2018; Galaa and Saaka 2011). However, given the stakeholder perceptions presented in this study, the attainment of the overall policy goals and objectives could be impaired, and hampered. On this basis, as part of the measures to countervail the situation, strengthen the policy, and possibly accelerate the attainment of SDG 4, we make the following recommendations:

- Strenuous efforts must be exerted to develop and further strengthen stakeholder cooperation between teachers, caterers, and community members.
- As part of the general radical reforms to be introduced, mechanisms must be instituted to track resource flows from the top hierarchy of the operations system to the designated recipients
- Efforts must also be made to root out incidence and tendencies of bribery and corruption that has come to take a center stage in the program. In this regard, managers of the program must institute measures targeted at penalizing officials reported for corruption behaviors. Furthermore, communication avenues must be created for people to report officers involved in corrupt practices.
- To address the issue of fund delays, government, in concert with stakeholders must ensure timely allocation of resources to caterers and other service providers to deliver efficiently and effectively.
- An appreciable dosage of decentralization should be injected into the institutional structure of the school feeding program. The current structure whereby the entire program revolves around political structures must be reformed to make room for accommodating other stakeholders like teachers and community members.
- Furthermore, reformation of the school feeding program should among other things take into cognizance poverty considerations. In this regard, schools in areas with high poverty incidence must be assigned priority in determining beneficiaries. There is therefore the need to reform the program by retargeting and identifying beneficiaries.
- As part of program reformation efforts, the study further recommends instituting measures to decouple the program from political structures like the district assemblies. In this regard, it would help stem the growing tide of political meddling in the affairs of the program. Essentially, this effort would be very cardinal to the restitution of public confidence, trust, and equity regarding the program.

- In essence, the depoliticization of the program should purposefully be designed to create space for the integration of teachers, community members, and opinion leaders. The current situation, whereby there exists a disconnect between these stakeholders, is actually militating against the program progress. By making stakeholders central actors, they are likely to not only develop a sense of ownership, but also perceive the program as a personal one. For reasons of having vested interests in the school feeding program, stakeholders are likely to expend their time and energy in ensuring program effectiveness, efficiency, and success.

## Synonyms

Between segregation; School segregation; Social segregation; Within segregation

## Introduction

### Why Is the Chilean School System a Rich Source of Learning About School Segregation Worldwide?

School segregation has multiple effects on the educational and developmental children opportunities, as well as for society as a whole, in the short, medium, and long term. On the one hand, when it occurs among vulnerable students, it affects the quality and equity of their learning, as it also makes social policies aimed at improving education less effective, since the concentration of more vulnerable students carries with it more complex requirements to achieve the objectives sought. However, there are also effects for all the socioeconomic groups, since higher degrees of social segregation reduce the development of socialization, inclusion, and civic development skills.

Often focused on the socioeconomic level, school segregation refers to the unequal distribution of students among schools, in this case according to the economic and human capital of families. In many countries this implies a two-tail distribution, that is to say, both the most vulnerable students and those with the best social attributes, tend to concentrate in schools and high schools with fellows of similar characteristics, while those of middle groups coexist with a greater relative diversity of students. On the other hand, academic segregation might not correspond to the same characterization, because in more equitable educational systems – where social conditions of origin have a lower incidence in the children's learning opportunities – both the degree and concentration of academic performance between schools could be lower than the socioeconomic concentration; while, on the contrary, in those countries where social conditions are closely linked to educational opportunities, both types of segregation will tend to converge.

Analyzing the experiences of the Chilean school system in the field of educational segregation, it is a matter of interest for several reasons. The first one, because there is information on the

social and academic characteristics of students and schools since 1999, which makes it possible to carry out longitudinal studies concerning the magnitude and intertemporal evolution of this condition, as well as the comparability between different levels of education, since databases are available for both elementary and high school students.

Second, the diversity of the academic literature for the Chilean educational system makes it possible to inquire about the factors that explain school segregation, facilitating the identification of public policies that could attenuate those processes. It is even more interesting to note that at the international level Chile is one of the countries with the highest school segregation, as can be seen in the results of more than 70 countries in the PISA test, where Chile is regularly among the three more segregated educational systems.

Third, the Chilean school system has been characterized for almost 40 years by the implementation of market oriented policies for the provision of education financed with public resources, where competition and the role of the market play a relevant role in the expectations to improve the quality of the whole system. Some of its main attributes are: (i) there is a payment associated with each student (voucher); (ii) there is a high degree of flexibility in the provision of private education, with low regulations for the entry of new establishments and with funding per student, similar to the one that is received by the public sector (also called private subsidized sector); (iii) Since 1989, the compulsory monthly payment is extended to families who decide to enroll their children in the private subsidized sector (co-payment); and (iv) a market where it was not prohibited the massive implementation of student selection mechanisms in schools, beyond the co-payment, such as entrance ability tests, parents interviews, not renewal of enrollment due to academic or disciplinary problems, among others. Those characteristics makes very attractive to analyze the Chilean experience, which becomes very useful in an international context where private participation in school education has systematically increased in many countries, especially in Latin America and the United States.

Finally, in the last few years, Chile has begun to implement a set of institutional changes and structural reforms aimed at improving the quality and equity of education, which, without segregation as a main objective, could have a high impact on reducing it. Among these reforms highlights: In 2008, a supplementary grant was approved for 40% of the most vulnerable students (Preferential School Subsidy Law), which implies up to 70% higher monthly resources for that group, but in order to be able to access it, private subsidized schools should agree to not select or use co-payment with those students. In the same sense, in 2014 it was approved the so-called "Law for School Inclusion" which entails, among other rules, the elimination of parental co-payment, and the elimination of academic as well as social selection of students in all schools receiving public resources.

## International Evidence on Segregation

### The Effects of School Segregation

In the growing international evidence of school segregation, effects on students have been documented. The first and the most important of all is the learning opportunities asymmetry – the so-called peer effects – generated by the concentration of students with less abilities or social backgrounds in schools or classrooms, where they have less opportunities to achieve a better quality of education (Angrist and Lang 2004; Duflo et al. 2011). The second one, and also important, is socialization, as the school is a space that enriches the interaction with other people, complementing the familiar experience to which the individuals are exposed, being able to introduce the students in the complexities of social life, one of whose main characteristics is the coexistence with people of different socioeconomic condition, racial origin, sexual orientation, among others. In this context, school segregation would impoverish citizen construction based on social diversity (Valenzuela et al. 2010). Being part of a socially integrated school provides benefits to all students, especially in a globalized society. In this way, it generates skills to develop

a better communication and to make friends of diverse origins; reduces the willingness to generate stereotypes, and generates higher levels of civil and social responsibility. Other generated benefits are intergenerational (reflecting long-term effects), so students who attend integrated schools are more likely to seek and be placed in integrated universities, neighborhoods, and workplaces (Mickelson and Nkomo 2012).

On the other hand, social policies in education, aimed at improving the conditions of disadvantaged individuals and groups, face additional problems, which limit their effectiveness, when they must address phenomena of concentration of poverty. Thus, the segregation of vulnerable groups makes them even more vulnerable and can permanently install social exclusion and disintegration. In this sense, "separate remains extremely unequal" (Orfield et al. 2012), that is, to generate school systems where students with certain characteristics attend different schools – those that concentrate similar students – entails maintaining and accentuating inequalities of origin.

In addition, a number of segregation effects have been documented for vulnerable groups within the school, such as: segregated schools have less experienced and less qualified teachers (Clotfelter et al. 2010); there are higher rates of teacher turnover; peer groups with less grades and inadequate materials and resources for learning. Likewise, other indicators such as repetition rate, expulsion rate, and school cohabitation problems are much higher in segregated and vulnerable schools.

## Factors Affecting School Segregation

In the international literature review, certain factors have been established that affect school segregation: extra-school factors, such as residential segregation and school choice; and intra-school factors, such as the attributes of the institutional design of the school system. Regarding residential segregation, it is evident that the place of residence affects the space and also the choice of parents, so the degree of residential segregation can be the main factor associated with the degree of school segregation.

Regarding the second point, the school choice studies have shown that it is not limited to socioeconomic inequalities, but rather associates to different positions within the social and cultural structure such as social class, race, ethnicity, religion, among others (Van Zanten 2007; Ladd and Fiske 2009). In this way, a search for cultural homogeneity would accentuate school segregation.

On intra-school factors and on the institutional design of the school system, mechanisms of students selection; massive use of repetition for students' failure; and the expulsion of students subject to academic or school cohabitation (Dupriez and Dumay 2006) affects directly the magnitude of segregation. In addition, a second type of mechanisms associated with internal academic selection is the tracking in different educational levels, which operate in different school systems around the globe such as the German, French, American, or Canadian (Dupriez and Dumay 2006; SCHNABEL et al. 2002). Despite the progress made in understanding segregation between schools, the segregation of students – generally by academic skills – within classes of the same grade has been less analyzed, practices that are more frequent among schools of greater size and greater heterogeneity among their students (Dupriez 2010; Ireson and Hallam 2001; Slavin 1990).

The within-school segregation presents positions that promote them and detractors. A positive view indicates that grouping students with similar abilities facilitates the instruction of teachers, and fewer students will be left behind, since teachers will adapt educational strategies to the more homogeneous attributes of students (Betts 2011; Duflo et al. 2011; Dupriez 2010); while detractors argue that a more diverse composition of students may be of greater utility to lower performing students, as well as argue about the difficulty in determining the innate abilities of students (Ireson and Hallam 2001).

In several studies, the results of the academic skills management account for negative consequences for the students with the lowest abilities, concluding that the advantages obtained by the best performers do not compensate the losses

among the students with the lowest achievements grouped together (Dupriez 2010; Ireson and Hallam 2001; Oakes 1985; Slavin 1990). It seems that the explanation of this inequity and inefficiency in student ordering by performance is explained by the fact that teachers reduce their expectations of students assigned to lower performance classes (Boaler et al. 2000) and because the distribution of the teachers between the different classes are not at random and generally the best ones are assigned to the students with the best performance (Toledo and Valenzuela 2015).

In addition, students assigned to low-performing classes tend to reduce their educational expectations early, as well as their sense of self-efficacy (Braddock and Slavin 1995), which affects both their overall and academic self-esteem (Ireson and Hallam 2001; Oakes 1985).

## Segregation, the Chilean Case

Observing the evolution of socioeconomic segregation at the national level during the last 15 years, it is possible to appreciate a series of distinctive features of the educational system: (i) there are high levels of social segregation, placing Chile as one of the most segregated countries within the participants of the PISA test (Chmielewski and Savage 2014); (ii) high segregation among the most vulnerable but still higher and growing among middle-high and high socioeconomic status (SES) students (Fig. 1); (iii) this situation is increasing among secondary school students, with a tendency to close differences with students in basic education (Valenzuela et al. 2015) (see Fig. 2); and finally (iv) a growing trajectory of social segregation during the early part of the 2000s and decreasing from 2007 (Fig. 2).

The concentration of vulnerable and higher SES students in fourth grade increased until 2007, this concentration was led by a greater homogenization inside the establishments of each type, rather than by a growing differentiation between the different types of schools. On the contrary, a gradual process of reducing social segregation – although in small magnitudes –

**School Segregation in Chile, Fig. 1** Estimated socioeconomic segregation between schools by SES thresholds, selected countries, PISA 2012. (Source: Chmielewski and Savage 2014)

**School Segregation in Chile, Fig. 2** Evolution of Duncan Index between schools for primary and secondary education, by SES, for percentiles 20, 40, 60, 80, and 90. (Source: Valenzuela et al. 2015)

has been initiated in the groups of vulnerable and middle students since 2007, whereas among the medium-high and high SES groups this process was reduced or, on the contrary, it continued growing.

The accumulated research in Chile during the last years shows that the high level of social segregation of the school system is not only a reflection of the residential segregation of our cities, since the first one far surpasses the second (Elacqua and Santos 2013; Valenzuela et al. 2008). In addition, social segregation also correlates with attributes inherent in the Chilean school system, such as the parental co-payment in the private subsidized schools, nonrandom distribution of schools in the territory (Auguste 2004; Rodríguez et al. 2016), heterogeneity in the family school preferences (Elacqua et al. 2006; Canales et al. 2016), and selection mechanisms used by schools.

## Factors that Explain School Segregation in Chile

The Chilean school system is based on a "relative freedom" of school choice, where parents in theory, when looking for a better educational quality for their children will prefer those schools with a better or demonstrated quality, thus the demand for this type of schools will derive in a gradual and sustained improvement of the system because schools that do not meet these requirements simply would not have sufficient enrollment. Emphasis has been placed to the relative freedom because the choice made is subject to a number of entry barriers imposed by the schools, and which depend on socioeconomic characteristics, geographical characteristics, or by the ability of the students themselves, among the main ones, that actually determine the structure of the Chilean educational system.

In this sense, some authors have postulated that what really stimulates the Chilean school market would not be the offer/demand of educational quality, but rather the promise – by the schools – of providing protection and security by avoiding mixing with lower level social sectors, so the choice of private schools would reflect the interest of the middle sectors to differentiate themselves from the poorest (Canales et al. 2016). In this sense, rather than quality – measured through objective performance indicators – what parents would look for when choosing a private subsidized school under this market system would not be educational quality but rather differ in some way from their peers. This is because the social composition of the school is understood as a component of status in Chilean society because some of them prefer to avoid this group of families (Saporito 2003), or because the new social composition could affect the average performance of the school (Epple and Romano 1998). This leads to an increase in social segregation, exclusion of disadvantaged students, and stigmatization of free public schools (Elacqua et al. 2006; Canales et al. 2016). In this way, this ability to "select" schools would be one of the main reasons why the Chilean educational system shows such high social segregation.

On the other hand, although families do not have an explicit preference for being segregated, if the assessment of the different attributes of the school varies according to the characteristics of the families, then students of different socioeconomic level will not attend the same type of school (Elacqua and Santos 2013).

In this sense, the hypothesis of neutral ethnocentrism (Ladd et al. 2009) postulates that vulnerable families tend to prefer schools with more homogenous compositions and therefore would not be oriented to select schools with better academic performance. On the contrary, the literature on the Chilean school system has shown that the elimination of entry barriers such as parental co-payment for enrolling their children in private schools has intensified the migration processes of vulnerable students (or lower SES students) from public education to private subsidized schools (Valenzuela et al. 2015), which would be perceived as of better quality. The above supports the document by Flores and Carrasco (2013), who identify that the vulnerable families of the Metropolitan Region in Chile would also choose within the best available school alternatives, after including in their election restrictions on the distribution and quality of the supply of schools in the neighborhoods where they live, and the magnitude of the additional payment that was requested, and thus removing support for the hypothesis of neutral ethnocentrism outlined above.

Likewise, it is possible to anticipate a heterogeneous effect on the social composition of schools, not only because of the effect previously described but also because some of the families of middle and upper-middle SES groups attending private subsidized schools, could decide to emigrate from these types of establishments because of the entry barrier removal, which is demonstrated in Valenzuela et al. (2015) after the implementation of the preferential school grant law (SEP).

Additionally, in a system where a large part of the new educational service providers only sought to maximize their profits, the best way to optimize their income was to locate their facilities in territories (neighborhoods) where the demand was very high or in places with high SES inhabitants, causing a residential segregation of the schools. In this way, large cities, as well as places where people of higher SES traditionally lived, benefited from the creation of large numbers of establishments, which logically increases the probability of accessing a high quality school.

In this sense, it should be mentioned that for students of lower SES, the proximity of an establishment could be critical because they usually attend schools closer to their homes, since longer trips involve higher costs, which a family of lower SES may not afford. Thus, the nonexistence or shortage of quality schools, as well as the segregation of these by territory would be helping to perpetuate the vulnerable conditions of origin observed in the Chilean educational system (Rodríguez et al. 2016).

One factor that has greatly influenced the perpetuation of segregation in the Chilean school

system since the 1990s has been the existence of explicit selection. In this sense, the empirical evidence for Chile has shown that school selection processes, especially through the application of ability tests to new students, interviews with students and parents, as well as the use of management of heterogeneity within schools, would be widely used by schools in Chile, at all levels of education and in schools with or without public subsidies (Contreras et al. 2010; Godoy et al. 2014).

The existence of these mechanisms has led, over the years, a great entry barrier to certain schools, especially for students of the most vulnerable sectors of society, who, due to their inequalities of origin, had to be satisfied with entering free, public, and nonselective institutions, schools for which it was not considered that educating vulnerable students with great social inequalities of origin has associated a higher complexity and cost in their education, since until 2008 the tax contribution per student was flat and not associated with the individual or average social attributes of their students. Thus, this type of mechanism naturally led to a worsening and sustained segregation of public education.

As mentioned, the management of heterogeneity within establishments is a practice that has grown more intensely since the 1990s. This is how the research on the frequency or magnitude of this phenomenon and its effects on segregation in Chile show that this type of grouping and selection mechanisms by skill would be very frequent in secondary education (Treviño et al. 2016a, 2017). This literature has shown that within segregation would have a negative impact on quality, equity, and educational efficiency, negatively affecting students mainly of middle groups (Treviño et al. 2016a), and high-performance students would benefit from this type of practice, which would not occur with low- and intermediate-performing students, mediated by differentiated teacher assignments, lower expectations for students with more academic difficulties, higher repetition and school withdrawal among these groups of students (Treviño et al. 2016a).

## Main Public Policies that Have Affected Segregation in Chile

Over the years, public policies have been implemented that, without aiming at school segregation, have had negative and positive effects on segregation. In this sense, within the policies that increased or made possible the accelerated segregation of the Chilean school system is the authorization granted to the subsidized schools to make a compulsory monthly payment to families who decided to enroll their children in this type of establishments (parental co-payment).

On the other hand, beginning with the massive protests carried out by students in 2006 and 2011, demanding structural changes to the Chilean educational system, a set of institutional and structural changes were begun to improve the quality and equity of education, which did not always have as a motivation the reduction of social and academic segregation of the school system, but we could anticipate that it will have a substantial effect in its magnitude. In this context, the two main ones stand out: The Preferential School Subsidy Law (SEP) and The Law for School Inclusion.

The following describes three public policies, as well as their effects on school segregation that have been found in the Chilean literature.

### Parental Co-Payment and Its Effects on Segregation

The financing system for Chilean education had an optional complementary instrument to the state subsidy received by the subsidized schools (public and private), which began to be used in 1989, called parental co-payment (FICOM), which was regulated in 1993. Specifically, the FICOM allowed private subsidized schools and special cases of public high schools to supplement the subsidy received through additional compulsory contributions from parents. This Law, besides allowing direct increase of the resources of the schools, would generate a fiscal saving that at the same time would allow a better targeting of the expenditure by the central government (Saavedra 2013).

Although the main purpose of this policy was to increase the resources available in schools, one of the indirect effects associated to its implementation was the differentiation or socioeconomic segregation. In this sense, the literature consistently shows that the parental co-payment system generated a differentiation in the socioeconomic composition of the students in the different dependence (public or private) of the schools (Valin 2011; Saavedra 2013). This led to a reduction in the choice options of the lowest income families in the country, as well as to the fact that families ended up enrolling their children in more segregated schools, where most of the classmates presented similar social and cultural conditions (Valenzuela et al. 2008; Saavedra 2013). Likewise, it is also possible to associate with this policy the increase in school segregation at the commune level observed between the mid-1990s and 2000 (Valenzuela et al. 2008).

### The Preferential School Subsidy Law and Its Effects on Segregation

The Preferential School Subsidy Law (SEP), implemented in early 2008, is the main public policy implemented to introduce greater equity to the Chilean educational system. The main objective is to correct the education financing system, providing an additional contribution to schools that host vulnerable students. This contribution was focused on 40% of the most vulnerable students in Chile, which implied up to 70% of higher monthly subsidy. In this way, the state subsidy was conditioned to the socioeconomic characteristics of the families of the most vulnerable students in order to compensate for social inequalities of origin and, therefore, it was recognized that educating vulnerable students would be more complex and costly.

Alongside this, schools that decide to participate – voluntarily – of the reform must assume a series of commitments, such as eliminate parental co-payment to students classified as vulnerable, a series of accountability process related to the use of resources and the obligation to develop and comply with an educational improvement program aimed at improving their school performance. It should be noted that this Law was the first change made to the school financing system after almost 30 years of operation of the existing vouchers system in Chile.

An indirect effect of this policy, which may become as relevant as the direct effect that greater financial resources have had on academic outcomes (Valenzuela et al. 2015, Neilson 2013, Vergara 2014), is the potential impact on the social composition of schools. In this sense, it is necessary to mention that the social recomposition of schools was not an explicit objective of the law, but it has allowed to give greater alternatives of choice to the vulnerable students when eliminating the entry barrier imposed by parental co-payment. Thus, in terms of results, since the implementation of the reform has seen a high mobility of students from public schools to private subsidized school with co-payment (Valenzuela et al. 2015). This migration may have undesirable effects on public education, since it could accentuate the reduction of enrollment, becoming a new mechanism to accentuate the deterioration of public education.

The literature on the effects of the SEP Law on the composition and socioeconomic segregation of school has shown that since its implementation there would be incipient achievements on the social recomposition of schools, so for 2011 shows – for the first time – a slight reduction in social segregation among middle school students, mainly affecting private subsidized schools but not public schools, and which was concentrated among low- and middle-income students, which could be an advance of a process that intensifies over time (Valenzuela et al. 2013, 2015). Alongside this, the literature shows a gradual inclusion of students with mothers of low schooling among private subsidized schools participating with SEP in fourth grade (Domínguez 2014). Finally, at this point, the intensity of participation in the SEP at the community level has slightly affected the reduction of social segregation in private subsidized schools but not in public schools (Roje 2014).

The effects that the SEP is having on social segregation shows that, despite the incipient achievements shown above, the halt of the increase since the end of the 1990s, and a gradual

reduction of school segregation in the later years, this process is match more attenuated than the social recomposition, and it could be describe as an "upward truncated decompensated social recomposition" (Valenzuela et al. 2015), where vulnerable students migrate from public education to private subsidized schools, where part of the private subsidized schools with co-payment accept this group of students, making these schools more socially diverse than before the reform, but where, in many cases, the migrants are in less integrated social conditions than in the public schools of origin.

At the same time, some of the students from families of higher SES are withdrawing not only from the public schools but now from the private subsidized with SEP, in this way the schools of medium-high and high levels that sign the SEP are what they modify more, although gradually over time, their social recomposition, that is, when they become free and nonselective, would be increasingly preferred by vulnerable student families. This leads to the conclusion that co-payment did act as an active entry barrier for families, as mentioned above.

### The Law for School Inclusion

In 2015, the Law for School Inclusion was approved, which entails, among other rules, the gradual elimination of parental co-payment, as well as the academic and social selection of students in all schools receiving state contributions. This public policy gives to international school systems an opportunity to learn about the Chilean experiences, since there are high expectations about the effects of these reforms on the processes of social integration between publicly financed schools that could happen in the coming years.

In this sense, Rao (2013) shows, for India, that when greater inclusion is achieved within schools, the better off children would improve or have a positive impact on characteristics associated with social behavior (such as generosity, socialization with peers or poorer people). However, this concentration of students with low socioeconomic level (and usually low achievement) would affect the rest of the students in a small but negative way in standardized tests (Rao 2013), a conclusion similar to that found in Noden and West (2009), for the case of England.

## Concluding Remarks

The Chilean educational system is of great interest for countries with high or extreme school segregation, mainly because after more than 10 years of policies which facilitate his proliferation and consolidation, since 2008 the country policy makers start to create and implement policies which aim to reduce it, maybe not as primary objective but as an indirect effect which may become as relevant as the direct effect. As show earlier with the empirical findings about the Preferential School Subsidy Law.

However, one of the main problems especially in primary education is associated with the residential segregation and as we saw above the territorial segregation of schools, that is why the effects associated with the new policies could be bounded, and complementary policies beyond the educational scope needs to be created and implemented.

With the successive implementation of the Law for School Inclusion, establishments that receive state funding will be prevented from selecting both by socioeconomic or academic level, an effect that will bring an increase in diversity within schools. However, this effect needs to be carefully observe because public schools could be harmed, because parents will have the opportunity – not present in the context of parental co-payment system – to enroll their kids into private subsidized schools leading into an extreme situation – derived from the discredit of the Chilean public education – where public schools will reduce enrollment even more than the already documented. In this way, public schools could be more segregated than they are at this moment (Valenzuela and Montecinos 2017).

Finally, although it is possible to anticipate a reduction in between-school segregation, as many international studies have shown (Chmielewski 2014; VanderHart 2006), incentives will be generated to implement (or create) policies of heterogeneity management within schools such

as grouping students by skills, by different types of teaching or technical training programs. Thus the increase of within-school segregation, especially in high school, is something that must be taken into account as of the implementation of the Law for School Inclusion.

# School Voucher Programs

Sheila Suess Kennedy
School of Public and Environmental Affairs, Indiana University Purdue University, Indianapolis, IN, USA

## Synonyms

School choice; School privatization

## Introduction

School voucher proposals gained traction in the late 1980s as part of a broader movement to privatize services previously delivered by government through its employees. Unlike the privatization program undertaken by Margaret Thatcher in England, in which public enterprises were sold off to the private sector, relieving government of further responsibility for their operation, in the United States, privatization referred to the practice of contracting out delivery of government's programmatic responsibilities to for-profit or

nonprofit third-party surrogates. Enthusiasm for this method of public service delivery led to a significant expansion of such practices, generating mixed results depending upon the service involved and the adequacy of government oversight. Voucher programs allowing parents to enroll their children in participating private schools of their choice, and to pay the tuition in full or in part with a government-issued voucher, have become one of the more contentious elements of the larger privatization agenda.

Enthusiasm for a market-based approach to schooling received impetus from a 1990 study by John Chubb and Terry Moe, *Politics, Markets and America's Schools.* Although several researchers subsequently challenged the data and methodology used in that study, which painted a grim picture of America's schools, fewer critics initially took issue with their definition of "effective schooling," which was to be measured against academic criteria only. For Chubb and Moe and those who agreed with their prescription for school privatization, the mission of the schools was limited to imparting competency in the math, science, and language skills deemed crucial to economic self-sufficiency and America's ability to succeed in the global marketplace. Only later did criticism of that premise become a major point of controversy between proponents and opponents of school vouchers.

## Philosophy and Partisanship

At its intractable extremes, the school voucher debate is a conflict between two long-standing elements of the American political tradition: the commitment to personal choice and individual freedom, on the one hand, and an equally compelling belief in the importance of a common civic infrastructure and collective interests on the other. Debate over vouchers has become so contentious in large measure because it reflects the tension between these largely incompatible political priorities.

Rather than debating whether public schools are as deficient as some have portrayed them, and if so, in what respects, or debating the merits of one reform measure over another, the policy issue has become whether America should continue to support a system of free, publicly controlled schools or whether government's educational role should be reduced to that of funder, enabling families to use a specified number of taxpayer dollars to buy educational services in the marketplace.

Initial support for school vouchers came from several interest groups: Catholics desiring financial support for their parochial schools, political libertarians opposed to government control of education on ideological grounds, business interests concerned about public schools' ability to produce a skilled workforce, and the Christian Right, which had advocated for Protestant prayer and religious instruction in the public schools and had been rebuffed by the Supreme Court in a series of cases beginning in 1962, when *Engel v. Vitale* struck down the practice of official prayer in public school classrooms. These constituencies were, and are, largely aligned with the Republican Party, while the most reliably anti-voucher interest groups – public educators, especially teachers' unions, the African-American community, and civil libertarians – represent important Democratic constituencies. Voucher programs have thus become a partisan issue (Kennedy 2001). The political dimension of the voucher debate has been underscored by the very active role taken by the American Legislative Exchange Council (ALEC), a corporate lobbying organization that supports voucher programs. ALEC's education task forces are funded primarily by libertarian interests, including the Charles Koch Foundation, the DeVos Foundation, and the Friedman Foundation (Shaffer et al. 2018).

Voucher proponents argue that competition in education leads to better schools at less cost. They point to test results showing that student achievement in private schools has historically been superior to the performance of students attending public schools. Opponents respond that much of the research purporting to compare public and private school outcomes fails to control for major differences in student body composition, including but not limited to parental socioeconomic status and educational motivation.

Opponents and even supportive academics also warn of potentially damaging social

consequences. John Witte, an educational researcher who evaluated and supported one of the earliest voucher programs, a 1990 experiment in Milwaukee, nevertheless noted that the program led to more segregation in the schools than otherwise would have been the case (Witte 2000). Other researchers have worried about religious balkanization, since an estimated 80% of the private schools participating in voucher programs are religious. Still others have expressed concern that voucher programs largely abandon the civic mission of the schools (Covaleskie 2007).

### Legal Issues

As voucher programs grew, opponents raised both First Amendment and state constitutional concerns, arguing that the use of public funds to pay tuition at religious schools violated both the First Amendment's Establishment Clause and state-level prohibitions known as "Blaine Amendments." The Supreme Court considered the First Amendment arguments in 2002, in *Zelman v. Simmons-Harris*. That case challenged an Ohio voucher program that affected only the Cleveland City School District. In 1999 and 2000, 82% of the schools participating in the Cleveland program were religiously affiliated, and 96% of the students using the vouchers were enrolled in one of those religious schools. Both the District Court and the Court of Appeals ruled for the parents who were challenging the program; however, the Supreme Court reversed. The Court accepted the defense's argument that the vouchers were payments to the parents, whose choice of religious schools was made freely and voluntarily, and that as a result, the vouchers could not properly be characterized as tax support for the religious schools. Since the choice of school was made by the parents, and the program's goal of allowing low-income children to escape a failing school system was secular, the Court held that the voucher program did not run afoul of the Establishment Clause.

State courts have largely adopted the logic of the *Zelman* decision, allowing voucher programs to operate despite state constitutional provisions forbidding the payment of state tax dollars to religious institutions. These provisions, commonly called "Blaine Amendments," were named for Congressman James Blaine, who sponsored a federal constitutional amendment in 1875 that would have forbidden public funding of religious schools. Blaine's amendment was seen as an effort to prevent government from supporting the Catholic schools that had originally been established in response to Protestant bible reading in public school classrooms. Blaine's effort at a federal amendment failed, but 38 states subsequently added such provisions to their state constitutions. In 16 states where Blaine Amendments seemed likely to preclude judicial approval of voucher programs, so-called neo-vouchers have used tax credits to circumvent the problem; the subsidies have been deemed "tax reductions" rather than direct spending. Arizona is the most prominent state employing this tactic; its Supreme Court upheld the state's "tax credit scholarships" in 1998. In two states, Massachusetts and Michigan, both vouchers and neo-vouchers have been held to violate those states' constitutions (Davis 2016).

### Performance

Recent research on statewide voucher programs in Louisiana and Indiana has cast doubt on the educational benefits promised by voucher proponents (Dynarski and Nichols 2017). Public school students who received vouchers to attend private schools subsequently scored more poorly on reading and math tests when compared to similar students who remained in public schools. The magnitudes of the negative impacts were large, and the results could not be explained by the particular tests that were used or the possibility that students receiving vouchers had transferred out of above-average public schools. According to a Brookings Institution overview of available research, a Louisiana public school student who was average in math (at the 50th percentile) and began attending a private school using a voucher declined to the 34th percentile after 1 year. Students in third, fourth, or fifth grades had a steeper decline, to the 26th percentile. A student at the 50th percentile in reading declined to about the 46th percentile. In Indiana, a student who had entered a private school with a

math score at the 50th percentile declined to the 44th percentile after 1 year. Earlier studies of voucher programs had shown more mixed results when measured by test scores, with scores improving for some students in some places and failing to improve for other students in other places.

In January 2018, *The Wall Street Journal* analyzed data on Milwaukee's program, the nation's oldest, and found that the city's 29,000 voucher students, "on average, have performed about the same as their peers in public schools on state exams."

A variety of explanations have been offered for the continued lack of evidence that vouchers improve student performance. Among the theories, public schools have improved more than private ones since the early 1990s; business interests, often lacking background in education, have established schools they are ill-equipped to run; before vouchers, private school classrooms were occupied by children from more privileged backgrounds, and test scores tend to correlate highly with parental income. To date, no consensus has formed around any of these explanations.

Indiana's results are particularly concerning, because the state has the nation's largest, and arguably least restrictive, voucher program. Initial enrollment caps have been abandoned, as has the rule that children would not be eligible for a voucher unless they'd attended a public school for at least 1 year. (The initial justification for vouchers was to allow poor children to leave failing public schools.) The program is no longer limited to poor children; recent research suggests that nearly a third of Indiana's voucher families could afford private school tuition without state subsidies (Shaffer et al. 2018).

## Civic Dimension

If communities are created and sustained by the things we have in common, by mutual engagements that build social capital, it is particularly important to consider how overarching values and civic commitments are transmitted, supported, and reinforced in a society as heterodox as that of the United States. The public schools have traditionally been seen as important to the forging of social solidarity and have long been regarded as a public good. The public schools play a major role in introducing students who come from increasingly diverse backgrounds to each other and to America's civic aspirations. To date, there are no research studies comparing public and private school performance in transmitting civic knowledge or success in encouraging civic behaviors.

Voucher proponents will generally not dispute the classification of education as a public good and except for the most ideological libertarians among them do support a role for the state: the role of funder. Where they differ from proponents of a strong public education system is on the identity of the provider of educational services. Privatization proponents argue that the market can and should provide the education services and that government should enable individual families to purchase them. On the theoretical level, the voucher debate is one more instance of the tension between the libertarian belief in the efficacy of markets and the primacy of individual choice and the more communitarian preference for mechanisms that encourage social cohesion.

## Funding and Oversight

Education in the United States is a function specifically assigned to the states, and funding for public education has consistently been a major state-level budget item. Given state educational systems' dependence upon the fiscal health and tax revenues of their home states, school funding and institutional quality across the country have been uneven. Voucher programs must be funded out of those same state budgets, and opponents of those programs charge that they are siphoning off funds desperately needed by the public schools. In Indiana, the state with the country's largest voucher program, state support for vouchers in 2016–2017 totaled 146.1 million dollars; between 2011 and 2017, the state spent 520 million dollars. Public school administrators assert that these are funds that would otherwise have gone to the state's public schools, while advocates for

voucher programs insist that the programs actually save the state money.

The fiscal impact of vouchers, and the veracity of the dueling claims, is difficult to assess for several reasons. Differences in the way in which states construct their programs means that impacts vary from state to state. Voucher proponents' claim that vouchers save taxpayers money is based upon the fact that most vouchers are issued for amounts that are less than the per pupil cost of educating a child in the state's public schools. Since the money that follows the child is less than the cost incurred by the public system to educate that child, the public school retains the difference. That claim, however, overlooks two reasons why such savings are more theoretical than real: first, a growing number of students enrolled in voucher programs were never in the public system. Second, there is not a one-to-one reduction of public school expense when a student leaves. For example, if one or two students leave a class of 25, the school system must still provide a teacher, a classroom, and supplies for the 23 who remain. The school system must continue to maintain its facilities and pay sufficient personnel to conduct necessary administrative functions. It is only when large numbers of children take vouchers and depart that school districts can realize savings by closing buildings, consolidating classes, and firing teachers. Thus far, there has been little to no credible research on the actual fiscal effects of the various iterations of voucher and neo-voucher programs on public school systems.

This lack of research is at least partially due to a lack of data. Oversight of voucher programs by most states has been minimal. Despite the large amounts of money involved, private schools accepting vouchers have not generally been subject to reporting requirements, either curricular or fiscal. In Louisiana, independent reporting found many religious schools teaching creationism in science class and using grossly inaccurate, religiously proselytizing texts in history. In Ohio, a 1999 investigation by the *Akron Beacon Journal* found school choice legislation had been developed as a quid pro quo for campaign contributions and documented improper political behavior by a local businessman who then established private schools specifically to take advantage of the opportunity created by the legislation. His schools generated 16 million dollars from vouchers in the 1999–2000 academic year; the students who attended his schools were subsequently found to perform more poorly than those in the public schools. In Florida, the *Miami News Times* won an award for its expose of a voucher program for children with physical and learning disabilities; the paper reported safety violations, physical abuse, frequent relocations, a lack of curriculum, and virtually no state oversight.

## Conclusion

The combination of cutbacks to public schools, reports of malfeasance by voucher schools, and the emergence of data undercutting the claim that privatization would improve student performance has dampened much of the initial enthusiasm for school vouchers; however, the programs still have substantial political support. It remains to be seen whether that support can be maintained and whether private schools accepting vouchers can improve their results sufficiently to justify continuation of these educational experiments.

# Scientific Management Theory of Organizations

Jeri Anne Hose-Ryan
Illinois State University, Normal, IL, USA

## Synonyms

Administrative Theory of Management; Managerial Hierarchy Organizational Effectiveness; Organizational Theory and Behavior; Scientific Management Movement; Taylorism

## Definition

Workflow: The process of performing specific tasks.

Efficiency: The rate at which work is completed coupled with the quality of work produced.

Design of Organization: Unlike Taylor's micromanagerial approach, examines the entire organization as a whole to determine efficiency.

PODSCoRB: Acronym of Gulick's guiding principles pertaining to the roles of managers and executives.

## Introduction

Several theories exist pertaining to how to best manage the workflow in organizations. In 1909, Taylor published "The Principles of Scientific Management," in which he theorized the most efficient way to manage production of a complex product is by simplifying the workflow and providing the best tools/methods for which to complete the work to maximize profits for both the company and the wage earner (whose primary objective Taylor assumes is to be wages and fails to take into account other factors that may motivate workers, including but not limited to personal job satisfaction, physical working conditions, or, in the more modern-day workplace, the availability of a family-friendly schedule, commute time, tuition reimbursement, the ability to work from home, health insurance coverage, and the like.) Taylor's focus was primarily industrial and was adopted by automotive industry giant Henry Ford. At the time, management at these factories had very little (if any) contact with workers unless errors needed to be addressed or disciplinary action needed to be taken.

Taylor outlines breaking the process down into departments with managers overseeing specific tasks and the implementation of workflow process. Scientific Theory of Management's four guiding principles are as follows:

- Replace working by habit/common sense with a scientific method to study work and determine the most efficient way to perform tasks.
- Match workers to their jobs based on capability and motivation, and then train them to work at maximum efficiency.
- Monitor worker performance and provide instruction/supervision to ensure maximum efficiency.
- Allocate the work between managers and workers in a manner that allows managers to spend their time planning and training while allowing workers to focus on assigned tasks (Taylor 1917). As a case study, Taylor analyzed the productivity of pig iron handler laboring for the Bethlehem Steel Company. Upon evaluation of their current workload, pig iron handlers were found to move an average of 12.5 tons of pig iron per day. Based on the strength of the average pig iron hauler and the workplace environment in which they performed their work, Taylor's calculations estimated each pig iron handler should be able to move not 12 tons of pig iron per day but 47 tons per handler. In order to form a workforce able to reach this daily capacity, Taylor studied each pig iron handler individually and established a team of the strongest most efficient men and gave them the goal of 47 tons of pig iron per day with a monetary wage incentive of $1.85 versus the $1.15 the men were currently being paid. Once the pig iron handler agreed he was a "high priced man," a specific pig iron hauling daily schedule was established. These men reached their

goal, and other workers strived to reach that goal so they, too, could make 60 cents more per hour.

## Beyond Taylor: Governmental Administration and the Influence of Fayol

One of the main facets of a workplace dominated by human beings was overlooked in the formation of scientific management theory: the very complex nature of humankind, including but not limited to an expanse of government-provided services.

Henry Fayol, also known as the "Father of Classical Theory" wrote "Administration Industrielle et Generale" in 1916 France and its English counterpart "General and Industrial Management" a little over a decade later. Fayol equated administration with management and helped pave the way for a hierarchical structure of management. Fayol's contributions to management theory can be applied to both the private and the public arena with roughly the same percentage of implementation success. He also considered and accounted for the human aspect of asset management.

He outlined six rather broad organizational activities: technical, commercial, financial, security, accounting, and managerial (Fayol 1930). Of these six activities, he further examined the complex, multifaceted role of the manager, which he classified it into five parts and proposed the acronym POCCC: planning, organizing, commanding, coordinating, and controlling.

He gave 14 principles (through which these activities can be performed), and these principles became the basis for classical organizational theory:

1. Division of work: Workers were evaluated on an individual basis and matched to positions suiting their physical and mental capacities while keeping an eye on maximizing profits.
2. Authority and responsibility: A manager must be endowed with an appropriate degree of authority, and with that authority comes the need to administer parts of that organizational power to members of his team as he deems necessary in the pursuit of organizational goals.
3. Discipline: The dual nature of discipline according to Fayol is the worthiness of the manager coupled with the respect of his employees.
4. Unity of command: Employees should be clearly able to identify who is responsible for their oversight and is based on a hierarchical organization with little consideration of organizational overlap.
5. Unity of direction: The organization in question should have clear, defining concise goals and objectives all managers and employees can work toward.
6. Subordination of individual to general interest: Managers are responsible for holding their own personal interests second to the greater good of the clearly stated organizational goals versus fulfilling personal agendas contrary to the good of the organization.
7. Remuneration of personnel: Employees compensated appropriately for their work, be it monetarily with wages or non-monetarily with titles and increasing responsibility, are inclined to be loyal and dedicated employees and more invested to assist with implementation of organizational goals.
8. Centralization: Top management should come from a central governing executive board to ensure the clarity of organizational goals. (Fayol does argue, however, that a balance of centrally located decision making and input from lower level managers is key to ensuring the centralized governing board remains in tune with those individuals administering the decisions and goals.)
9. Scalar chain: Organizational hierarchy should be a transparent line making employees clearly see who is responsible for which parts of the organization.
10. Order: Managers are responsible for providing the tools/training for employee success.
11. Equity: To maintain a smoothly operational workplace, each employee must be treated with not only kindness and respect but also

with managerial impartiality and with a focus on achieving the goals set for employees.
12. Stability of tenure: A high rate of employee turnover can be expensive to the organization in terms of training and placement of new employees into the positions where they can most help achieve the organizational goals.
13. Initiative: In the course of managing employees, managers will develop innovative strategies to improve workflow and organizational efficiency. Managers should feel secure enough to share these ideas with upper management.
14. Esprit de corps: As Fayol was French, the concept of morale and cooperation does not adequately translate to English. Managers are responsible for cultivating a spirit of unity both for the individual employee and his team of workers as a whole.

The Fayol principles of management became the basic essence of administrative design used in the US federal government (Van Vliet 2010).

## Mooney and Reiley

James D. Mooney and Alan C. Reiley, in their work **Onward Industry! The Principles of Organization and Their Significance to Modern Industry** (1931), aided in the development of organizational effectiveness theory by analyzing and condensing the myriad theories of several administrative management pioneers into universal principles:

1. The coordinative principle.
2. The scalar principle and the directionally fluid scalar chain, in which superior and subordinate relationships are able to flexibly communicate both up and down the chain for maximum efficiency and the introduction of ideas that may well have a positive impact on the organization as a whole.
3. The functional principle, including line and staff principal as well as vertical vs horizontal coordination.

## The Contributions of Gulick and Urwick

Taylor's development of managerial theory began at the very basic level of the workplace and examined the very act of managing each task efficiently with training workers to complete their tasks quickly and accurately.

Luther Gulick and Lyndall Urwick were members of a committee to the US President and published a report named "Papers on the Science of Administration," in which they outlined a managerial approach that evaluated the organization as a whole to determine best management practices.

Gulick, a French mining engineer, developed managerial theory based on his experiences with the US Military and within the company in which he worked his way into a management position. He had circumstantial experiences with both civil and industrial organization (whereas Taylor remained firmly rooted in the industrial sector).

Gulick outlines his principles of administration as follows: division of work (a Taylor concept), base of departmentalization, coordination through hierarchy, deliberate coordination, coordination through committees, decentralization, delegation, line and staff, chain of command, and span of control. From these administrative principles, he together with Urwick developed the PODSCoRB theory of the most efficient managerial style possible:

P: Planning – Deciding what to do, i.e., setting agenda.
O: Organizing – Allocating and organizing activities, i.e., setting up of organizational structure.
S: Staffing – Personnel managements and its related activities.
D: Directing – Decision and giving orders to convert into work.
Co: Coordinating – Establishing connectivity and cooperation between the parts.
R: Reporting – Providing status and reports to the concerns (e.g., managers).
B: Budgeting – Fiscal planning and management, accounting, and control (Gulick 1937).

Lyndall Urwick, born in late nineteenth-century Britain, was educated at Oxford University and served as a Lt. Col. in the British army during the First World War. His life experiences within those diverse hierarchical structures assisted him in his development of the ten principles of administration:

1. The Principle of the Objective: All parts of the organization are responsible for working together to execute the goals of the organization.
2. The Principle of Specialization: The activities of each member of the organization should be as single-function minded as possible to ensure an ultrafine focus on their specific tasks at hand.
3. The Principle of Coordination: Unity of effort within the organization must be emphasized with a clear eye on the organizational goals.
4. The Principle of Authority: Workers should be able to identify precisely who and where the supreme authority in their organization lies.
5. The Principle of Responsibility: Superiors and subordinates alike are able to establish transparency in which responsibilities fall under which organizational positions.
6. The Principle of Definition: Superiors and subordinates alike are able to clearly define their specific responsibilities within the organization.
7. The Principle of Correspondence: Managers and workers need to maintain open lines of communication.
8. The Principle of Span of Control: This principle places limits on the number of subordinates a manager can effectively and efficiently manage.
9. The Principle of Balance: Acknowledging an organization can have several specialized units which work together to maintain organizational cohesion, the power and authority of all units should be at comparable levels in order to ensure the achievement of organizational goals.
10. The Principle of Continuity: A wise manager will realize the need for structural reorganization as both the organizational goals and outside forces demand them (Urwick 1930).

## Criticisms of the Scientific Theory of Management

Scientific Theory of Management has many criticisms expounded upon by many scholars of management theory and administrative theory. The most common is as follows:

John Hobson, English economist and one of Taylor's peers, cited, "evident that when we pass from technical improvement of tools to improved methods of working, we open possibilities of opposition between the business and the human interest" (Hobson 1914: 207). Also, "the liberty, initiative, judgement and responsibility of the individual workman are reduced to a minimum" (Hobson 1914: 209). Social considerations are lacking in scientific theory; workers are viewed as easily replaced cogs in the machine of industry.

## Conclusion

Taylor began a workplace revolution when he published The Principles of Scientific Management. Workplace administration now had a theoretical guide backed by successful experiments in increasing workflow productivity and therefore increasing profits.

The theories are rudimentary and view workers in terms of work efficiency while negating their social/human aspects that inevitably impact the worker throughout the course of their careers. A marked distance between management values and worker values contributes to workplace discord and labor unrest.

# Scientific Research on the Efficiency of Public Expenditures

Tomás Dias Sant'Ana[1], André Vaz Lopes[2], Rodrigo Fontenelle de Araújo Miranda[2], Paulo Henrique de Souza Bermejo[2], Gisela Demo[2] and Fábio Henrique dos Anjos[3]
[1]Department of Administration, University of Brasilia, Brasília, Brazil
[2]University of Brasilia, Brasília, Brazil
[3]Federal University of Alfenas, Alfenas, Brazil

## Synonyms

Effectiveness; Efficacy; Public administration, Public spending

## Definition

The efficiency of the public sector is measured in comparison with other sectors, that is, if a specific economic entity (company, sector, country) is more or less efficient compared to other economic entities.

New Public Management (NPM) theories have an emphasis on a minimal state, with a focus on privatization and an assessment of the role of the state.

Efficiency use productively resources, optimizing the cost-benefit ratio.

Efficacy focus on results rather than inputs, standards of performance, and quality measures.

Effectiveness is to properly do what has to be done, producing significant impacts.

## Introduction

The efficient management of available resources is a subject of great interest to public sector studies (Narbón-Perpiñá and De Witte 2018). Even after years of research, the subject remains central to political and academic debates (D'Inverno et al. 2018).

In this sense, academic research has made some progress in measuring the relative performance and efficiency of public spending, using analyses of the services offered or the results achieved (Ribeiro 2008; Wilson 2005). However, authors have pointed to the need to incorporate qualitative variables in the studies on public spending (Elston et al. 2018; Nazarko and Saparauskas 2014) and for the combination of qualitative and quantitative elements.

Taking into account the context described, the objective of the present study is to identify and analyze the literature on the application of public resources based on the efficiency, efficacy, and effectiveness of expenditures, aimed at meeting the wishes of citizens, published in the last 20 years. The entry aims to answer: how deep is available scientific research on the efficiency of public spending and what is the future of this research?

In order to make this inference, the bibliometric analysis method is used in selected articles, which will be described and analyzed: the number of publications, the journals that published on the researched topic, the authors, the geographical areas of origin of the authors, the factor impact of the articles, and the methods used to evaluate the efficiency of public spending.

## Theoretical Framework

Describes the theoretical and conceptual literature on the theory of public administration and the efficiency of public spending. It also assesses the efficiency of public spending and innovation.

### Theory of Public Administration and Public Spending Efficiency

The discussion on the efficiency of public agencies is a subject that inevitably stands out because these institutions ultimately make use of taxpayer money to perform their functions. Pérez-López et al. (2015) corroborate and suggest the related need to use appropriate financial resources to reduce costs and increase efficiency in the provision of public services. The efficiency of the public sector is measured in comparison with other sectors, that is, if a specific economic entity (company, sector, country) is more or less efficient compared to other economic entities (Joumard et al. 2004). In addition, efficiency is assessed as a ratio between costs and results, compared to the same variables in other countries (Joumard et al. 2004). If the results (quality of public services or public goods produced) are better, with equal or lower costs, the public sector in that country is considered more efficient.

### Evaluating the Efficiency of Public Spending

There has been a growing effort by various institutions and researchers to apply different methodologies to evaluate the efficiency of public spending: Stochastic Frontier Analysis (SFA) and Data Envelopment Analysis (DEA) are among the most widely used methods.

A recent study evaluated the efficiency of public spending in municipalities in Tuscany, Italy, using the DEA method, taking into account expenses with education, social services, road maintenance, urban mobility, policing, and general administration. The authors concluded that the size of the municipality affects the efficiency of public spending: the larger the municipality, the greater the efficiency (D'Inverno et al. 2018).

Pang et al. (2014) used the SFA to study the impact of the use of information technology (IT) on the efficiency gains of state governments in the United States. The authors found that there was a positive relationship between IT spending and cost efficiency, where the US $ 1.00 per capita investment invested in IT generated an increase of $1.13 in efficiency gains, indicating that the investment in IT can help overcome a fiscal crisis.

## Research Method: Characterization

Used Bibliometric analysis method for measuring and analyzing scientific literature. Its purpose is to measure the output of scientific research through data derived from scientific literature (Okubo 1997).

### Search Procedures

The research followed the protocol proposed by Cronin et al. (2008) and involved the following steps: (1) formulation of the research question; (2) the definition of inclusion and exclusion criteria; (3) identification of topical articles; (4) evaluation of the quality and relevance of the literature included in the initial review; and (5) analysis and synthesis of the results. The final bibliometric analysis included 115 articles. The title of each journal, authors' names, authors' affiliations, number of authors, year of publication, and public expenditure evaluation methods were recorded; as well as whether their method was qualitative, quantitative, or mixed; the specific field analyzed (e.g., education, health, local costs, transportation, etc.); and the country or region studied. Based on these records, independent analysis was performed for each variable.

## Results

The articles were described and analyzed by the number of publications, the journals that published on the subject researched, the authors, the geographical areas of origin of the authors, the impact factor of the articles, and the methods used to evaluate the efficiency of public spending.

- Quantity and period of publications: In total we identified 115 relevant articles that were

published between January 1998 and March 2018, making for an average of 5.75 articles per year over 20 years. The largest number of publications in any single year was 27, in 2017.

- Journals: The articles selected for final inclusion were published in 99 different academic journals. The scattered nature of publications on this topic is noteworthy. Only 13 journals published more than one article on our topic, and of these only 2 published more than two articles (Espacios, 4; Journal of Public Administration, 3).
- Authors: We found that 244 different authors were credited for the 115 included articles; the average number of authors per article was 2.65. We also observed that 31.30% of the articles were written by a single author, 29.57% by two authors, 25.22% by three authors, and 13.91% by four or more authors. However, 92.62% of the included authors published only one paper included in our selection; 6.97% published two articles, and only one author (0.41%) published three on this topic.
- Geographic representation: Of these 244 authors, 46.01% were affiliated to European institutions, while 35.74% were affiliated with institutions in America and 11.79% were affiliated with Asian institutions. However, it should be noted that approximately 59% of the authors were concentrated in only seven countries: Brazil (55), United States (34), Spain (25), Italy (11), Germany (10), Greece (10), and Portugal (10). In addition, more than half – precisely 59.13% – of the 115 articles used data from only nine countries – Brazil (15), the United States (10), Spain (6), Italy (5), Japan (4), Germany (3), China (3), Greece (3), and Portugal (3) – plus Europe (10) and OECD (6), which establishes a scenario for research into efficiency in public expenditure.
- Article impact: Citation analysis can provide an overview of the articles' influence. The average number of citations per article was 9.70. However, 38.26% of the articles were not cited a single time, although the majority of these (63.64%) were published during the past 2 years.
- Areas and services analyzed as public expenditures: We identified 26 different research sectors among the 115 included articles. Some articles analyzed more than one research sector. Education was the most popular sector; moreover, among the seven articles with the most citations, 77.78% (5) of them focused on education, and in 40.00% (2), it was the sole research sector. Overall, 29.86% of all included articles analyzed the education sector, while 20.83% analyzed the health sector, 10.42% analyzed local government, and 9.03% analyzed general administration.
- Techniques used to evaluate the efficiency of government spending: Seven of the included articles consisted of exclusively theoretical studies. Of the 108 remaining studies that included an empirical component which could be verified, quantitative studies (90.74%) predominated. SFA and DEA were the techniques most widely used to assess the efficiency of public spending, together accounting for 60.77% (79) of all techniques used.

## Discussion

Research on public spending efficiency has grown in recent years. In general, research has focused on the fields of activities of the state, such as health and education, and on governments' public policy results in relation to expenditures. Most of the research used quantitative methods, indicating a greater concern for efficiency in the implementation and execution of public resources. Moreover, the majority (60.77%) of the articles used DEA or SFA to analyze their results. The results of the present study provide an overview of research on the efficiency of public spending that was published during the last 20 years. The wide distribution of the publications' authors, institutions, journals, and authorial countries indicated that concerns about the efficiency of public spending is global and affects countries of different sizes and in different stages of development, thus confirming the strategic nature and pertinence of

the topic. There are a number of opportunities for further research in the field of public expenditure efficiency. Notably, the paucity of qualitative studies suggests a need for qualitative or multi-method research that combines qualitative and quantitative approaches.

## Conclusion

The present review provided a systematic overview of international research on public spending efficiency over the past 20 years, using a bibliometric analysis. It constitutes a seminal step in the mapping of research on this topic, bringing to light the challenges that remain and suggesting new possibilities for making public spending more efficient. The recent global economic crises, and the constant need of governments to implement effective public policies at the lowest possible costs, ensure the ongoing importance of research regarding the efficiency of public spending. The present study demonstrated that there are still gaps in the literature on this topic, including methodological limitations and a shortage of studies on governments' internal expenditures to maintain their administrative machinery.

# Scope of Some Scoring Rules Applying, The

Andrei Ivanov
Graduate School of Management, St. Petersburg University, St. Petersburg, Russia

## Synonyms

Scoring formula; Scoring rule; The most economically advantageous tender

## Definition

For the award of public procurement contracts, contracting authorities use one of the two different approaches, namely, the lowest price or the most economically advantageous tender. The latter is applied when price and quality matter. In this case, scoring rule, which transfers the price and quality of bidder's offer into the points, is needed.

## Introduction

In the modern public procurement, contracts can be awarded according to results of bids comparing on one or more criteria. In the second case, the contracting authority (or, other words, public buyer) has to assign scores to suppliers' bids on each criterion. In the international practice, there are a lot of assignment rules, which have been applied for a long time without serious trouble.

However, the experience of the Russian Federation has revealed that in the institutional environment, which is characterized by corruption, low competition in the tenders, and regulatory policy, aimed at the restriction of public buyer's discretion power, the applying of some famous rules cannot be recommended at all (linear scoring rule without threshold (Dini et al. 2006, p. 305)) or can be recommended with some restrictions (highest bid–lowest bid scoring rule (Dini et al. 2006, p. 309)). Thus, the accumulated experience can give to researchers and regulatory bodies some valuable information about their applicability in institutional conditions that are typical for developing countries and, in some extent, for developed ones too.

## The Three Scoring Rules

Let us consider a contracting authority seeking to procure an indivisible differentiated good by means an open tender. We suppose that there are $m + 1$ awarding criteria ($m$ of them for the quality assessment, including the delivery terms, volume and duration of the warranty, costs of operations and, may be, utilization, and so on, and price), and any supplier's bid has the form: $B = (q_1, q_2, \ldots, q_m, p)$.

The contracting authority attributes to supplier's bid $B$ the total score:

$$U(B) = \sum_{i=1}^{m} w_{qi} Q_i + w_p P, \qquad (1)$$

where $w_{qi}$ and $w_p$ are the weights of awarding criteria defined by the contracting authority under some restrictions established by the regulator and $\sum_{i=1}^{m} w_{qi} + w_p = 1$; and $Q_i$ and $P$ are the scores of the same scale, assigned to the values of criteria according to the corresponding scoring rule.

Thus, Formula 1 demands the specific scoring rule, which transfers the price and quality of bidder's offer into the points. To explain what scoring rule is and which rules exist, we assume that there are two awarding criteria (quality and price) and total score of each supplier's bid $B = (q, p)$ is:

$$U(B) = w_q Q + w_p P, w_q + w_p = 1 \qquad (2)$$

Suppose that selecting stage of the tender have passed $N$ ($N > 1$) suppliers with bids $(q_1, p_1), \ldots, (q_N, p_N)$. We designate

$$q_{\min} = \min_{1 \le i \le N} q_i, \quad q_{\max} = \max_{1 \le i \le N} q_i,$$
$$p_{\min} = \min_{1 \le i \le N} p_i, \quad p_{\max} = \max_{1 \le i \le N} p_i$$

There are many ways how the contracting authority can assign scores $Q$ and $P$ to the supplier's offer on quality $q$ and price $p$ (Dini et al. 2006, pp. 304–310). We assume that quality is an increasing criterion: for any scoring rule, the higher value of quality gives the higher score, and price, in turn, is an decreasing criterion: for any scoring rule, the higher value of price bid gives the lower score.

Below we will consider following three scoring rules: the highest bid–lowest bid scoring rule, the linear scoring rule, and the highest/lowest bid scoring rule (Ibid). These rules have been applied in the Russian Federation; and the accumulated experience can give to researchers and regulatory bodies some valuable information about their applicability in corresponding institutional conditions.

### Highest Bid–Lowest Bid Scoring Rule

The basic formula of the highest bid–lowest bid scoring rule is

$$Q_i = \frac{q_i - q_{\min}}{q_{\max} - q_{\min}} \times L,$$
$$P_i = \frac{p_{\max} - p_i}{p_{\max} - p_{\min}} \times L, L \geq 1, \quad (3)$$
$$i = 1, \ldots, N.$$

where integer $L$ is the maximum number of points available to the bidder for his quality/price offer.

Correspondingly, the total scores of suppliers' bids are

$$U(q_i, \ p_i) = w_q Q_i + w_p P_i, i = 1, \ldots, N.$$

According to Formula 3, the rule (Rule 1.1) gives maximum score ($L$ points) to the best bid and minimum one (0 points) to the worst bid and scores all other bids proportionally their distance from the worst bid (Fig. 1a, b, $L = 1$).

Sometimes, the regulator prefers to use the range of points [1, $L$] ($L > 1$) and prescribes to apply the following variation of Formula 3 (Rule 1.2):

$$Q_i = 1 + \frac{q_i - q_{\min}}{q_{\max} - q_{\min}}(L - 1),$$
$$P_i = 1 + \frac{p_{\max} - p_i}{p_{\max} - p_{\min}} \times (L - 1), \quad L > 1 \quad (4)$$

Figure 2a, b illustrates Rule 1.2 for $L = 10$.

### The Linear Scoring Rule

The linear scoring rule (Dini et al. 2006, p. 305) is usually applied to the price criterion and described by the following expression:

$$P_i = \left\{ \begin{array}{ll} 0, & p_i > p_r, \\ \dfrac{P_r - p_i}{P_r - P_{thr}} \times L, & P_{thr} \leq p_i \leq P_r, \\ L, & 0 \leq p_i < P_{thr}, \end{array} \right\} \quad (5)$$

where $P_r$ is the reserve price and $P_{thr}$ is the price threshold.

Thus, the bidding at the reserve price and above does not give to the supplier any points; the bidding at the price threshold and below gives to him $L$ points (Fig. 3). To define the price threshold, the buyer has to bear some additional costs, and, if he is going to avoid it, it is possible to apply the linear scoring rule without threshold ($P_{thr} = 0$):

$$P_i = \frac{P_r - p_i}{P_r} \times L, \quad 0 \leq p_i \leq P_r. \quad (6)$$

The most clear interpretation of Formula 6 can be done, if $L = 100$. In this case, the supplier's price score just equal to his price discount: 0% discount ($p_i = P_r$) gives 0 points, 10% discount ($p_i = 0.9P_r$) gives 10 points, 50% discount ($p_i = 0.5P_r$) gives 50 points, and the only zero price bid (100% discount) gives to the supplier 100 points. Figure 3 illustrates the linear scoring rules with and without threshold (the thick dotted and solid lines, correspondingly, $L = 100$) and the main difference between them: to obtain the same score $P$, the second rule demands significantly more discount.

### The Highest/Lowest Bid Scoring Rule

The highest/lowest bid scoring rule (Dini et al. 2006, p. 309) assigns to values of quality and price criteria following scores:

**Scope of Some Scoring Rules Applying, The, Fig. 1** (**a**) Rule 1.1 for the increasing criterion. (**b**) Rule 1.1 for the decreasing criterion

**Scope of Some Scoring Rules Applying, The, Fig. 2** (**a**) Rule 1.2 for the increasing criterion. (**b**) Rule 1.2 for the decreasing criterion

**Scope of Some Scoring Rules Applying, The, Fig. 3** Linear scoring rule with and without threshold

$$Q_i = \frac{q_i}{q_{\max}} \times L, \quad P_i = \frac{p_{\min}}{p_i} \times L. \qquad (7)$$

Similar to Rule 1.1, this rule assigns $L$ points to the best bid, but in contrary to it, the points of the worst bid can be close to $L$ as well to 0, depending on the difference between best and worst offers. The highest/lowest bid scoring rule generates the incentives to aggressive bidding: the highest (lowest) bid on quality (price) is awarded maximum point, on the one hand, and decreases the competitors score, on the other hand.

## The Public Procurement Institutional Environment in the Developing Countries: The Russian Case

The functions of a state involve the provision of various services to the population in areas such as health, education, utilities, etc. In this case, any society, first and foremost, democratic, in varying degrees, exerts pressure on the state, demanding higher quality, range, and quantity of such services and/or reducing the cost of their provision.

Around since the early 1980s of the last century, countries, where such pressure was in a greater degree, began to implement a variety of tools, improving the efficiency and quality of services, including decentralization, performance auditing, contracting out, and so on. By the mid-1990s, this kind of policy was formed under the name of New Public Management (hereafter – NPM).

On the one hand, NPM tools have focused on the introduction of competition in the provision of public services and, on the other hand, gave rise to various forms of collaboration between the public and the private sector in the creation of infrastructure and the provision of services on its basis to the population. For this kind of collaboration gradually, beginning from the Great Britain, stuck title public-private partnership (hereafter – PPP).

In the Russian Federation, like other countries with emerging economy, market reforms have created such political and economic conditions, in which the tools of NPM had become in demand. In particular, great efforts have been directed at the restoration of institutions, which were not used in the time of the Soviet Union (1917–1991): public procurement and public-private partnership.

In the Russian Federation, the introduction of NPM tools occurred in the context of intense economic reforms and was objectively accompanied by growth of corruption (Huntington 1968, p. 59). The development of public procurement has created a new area for corrupt behavior and formed specific public procurement corruption – practice of kickbacks: public buyer sets up inflated price of purchasing goods (works, services), then restricts competition in the tender, after that pays to the preselected winner the inflated price, and, finally, shares with the latter his surplus.

In the modern information-transparent world, the corruption in the public procurement inevitable reflects in the mass media in the form of the numerous corruption cases and creates the demand on the strong anti-corruption policy. It is a common knowledge that there are three pillars of anti-corruption policy: restricting the discretionary power of public buyers, preventing them from rent-seeking behavior, and strengthening the institutions (Aidt 2003, p. F633). However, it is not a simple task to fit the balance between the combating corruption and efficiency of public procurement. Due to the lack of experience in the public procurement, in the corresponding legislation, created by 2006, Russian regulators applied a complex of extremely strong tools for restriction of the public buyer's discretionary power:

- Very low price thresholds had been established, extending the area for corrupt behavior and creating the demand on the additional monitoring efforts.
- The applying of the qualification criteria had been restricted, giving to all firms an easy access to public procurement market.
- The second-price (English) auction was selected as the main procurement method; thus, it was impossible to award contract by the criterion of the most economically advantageous offer for all homogenous goods and even for some differentiated goods.

The second and third tools created a risk of awarding contract to the *mala fide* suppliers, which cannot or are not going to satisfy public buyer's demand. That is why, the bona fide contracting authorities have to restrict competition in the tenders similar to *mala fide* ones, which do the same for bribes.

Thus, the competition in the Russian tenders, which are divided to the auctions (the price is a single criterion) and contests (there are, as minimum, two criteria: price and something else), is essentially lower than, for example, in European Union (Fig. 4a (an average number bids for tender)-4b (an average number and median bids for tender)).

Thus, most of Russian contests, which demand the applying of scoring rules, have not more than two bidders.

## The Applying of Some Scoring Rules in the Russian Institutional Environment: Several Lessons for Developing and Developed Countries

In this section, we will consider a contracting authority who is seeking to procure indivisible differentiated goods in the institutional environment, which is characterized by corruption, low competition in the tenders, and regulatory policy, aimed at the restriction of buyer's discretion power.

### Highest Bid–Lowest Bid Scoring Rule

In the Russian Federation, the highest bid–lowest bid scoring rule has been applied in the public procurement and public-private partnership tenders. The legal acts, which have introduced the rule, are summarized in the table below (Table 1).

For the public-private partnership tenders, the regulator prescribes to apply the rule in the form (3) with $L = 1$ (Fig. 1a, b):

**Scope of Some Scoring Rules Applying, The, Fig. 4** (**a**) The competition in tenders in RF (Source: Federal State Statistics Service). (**b**) The competition in tenders in EU. (Source: Public procurement in Europe, 2011)

**Scope of Some Scoring Rules Applying, The, Table 1** The Russian legal basics of the highest bid–lowest bid scoring rule

| # | The legal act | Validity | |
|---|---|---|---|
| | | From | To |
| 1. | The letter of Ministry of Economic Development (for public procurement) | 01/01/2006 | 01/11/2009 |
| 2. | Federal Law #115 "On Concession Agreements" (art. 32-5) (for public-private partnership) | 21/07/2005 | Hitherto |
| 3. | Federal Law #224 "On Public-Private Partnerships . . ." (art. 28-5) (for public-private partnership) | 13/07/2015 | Hitherto |

$$Q_i = \frac{q_i - q_{\min}}{q_{\max} - q_{\min}}, \quad P_i = \frac{p_{\max} - p_i}{p_{\max} - p_{\min}}, \tag{8}$$

and for the public procurement tenders – in the form (4) with $L = 10$ (Fig. 2a, b):

$$\begin{aligned} Q_i &= 1 + \frac{q_i - q_{\min}}{q_{\max} - q_{\min}}(10 - 1) \\ &= 1 + \frac{q_i - q_{\min}}{q_{\max} - q_{\min}} \times 9, \\ P_i &= 1 + \frac{p_{\max} - p_i}{p_{\max} - p_{\min}} \times 9 \end{aligned} \tag{9}$$

All properties, discussed below, are the same for the rules, defined by Formulas 8 and 9, and further, for definiteness reasons, we treat the highest bid–lowest bid scoring rule in the form (8). Below, we will examine the properties of the rule in the institutional environment similar to the Russian Federation one.

We begin with consideration of a public buyer, who for assessment of bids sets up two criteria, quality and price, and their weights $w_q$ and $w_p$, correspondingly. Russian regulatory policy makes the buyers to give the higher weight to the price criterion, and we will follow this restriction: $w_p > w_q$.

Let us assume that at the tender two bids have been submitted: $B^1 = (q_1, p_1)$ and $B^2 = (q_2, p_2)$. We exclude from the consideration the case when the one bid dominates the other one different from it or, other words, has the higher (or the same) quality and lower (or the same) price and suppose for definiteness reasons that $q_1 > q_2$ and $p_1 > p_2$.

Given assumptions, the highest bid–lowest bid scoring rule assigns to suppliers' quality and price bids following scores (Formula 8, Fig. 1a, b): $Q_1 = 1$, $Q_2 = 0$, $P_1 = 0$, $P_2 = 1$. Thus, the total scores of bids will be:

$$U(B^1) = w_q \times 1 + w_p \times 0 = w_q,$$
$$U(B^2) = w_q \times 0 + w_p \times 1 = w_p.$$

Thereby, the supplier, who submitted the bid with the lower price, will be awarded the contract independently of "quality" of his quality suggestion, and, respectively, there are no incentives for him to improve the latter, if the supplier knows ex ante (i.e., before the submitting the bid) that he is a price (or quality, if $w_p < w_q$) "leader" (this proposition demands some additional assumptions; however, the exact consideration of them is beyond the scope of this article and can be found in Ivanov (2016)).

Let us move to the consideration of the general case. Suppose that there are $m + 1$ awarding criteria: $m$ of them for the quality assessment and price and public buyer attributes to each supplier's bid $B = (q_1, q_2, \ldots, q_m, p)$ the total score:

$$U(B) = \sum\nolimits_{i=1}^{m} w_{qi} Q_i \times w_p P, \sum\nolimits_{i=1}^{m} w_{qi} \times w_p = 1.$$

We will assume that there is a criterion with its weight more than 0.5, for example, $w_p > 0.5$, two suppliers have submitted their bids, and the price bid of the first supplier (we will call him the Winner and mark his bid components by the index $W$) is less than the second one (the Looser, index $L$). Given assumption, we have

$$U(\text{Winner}) = \sum_{i=1}^{m} w_{qi} Q_{iW} + w_p P_W$$
$$= \sum_{i=1}^{m} w_{qi} Q_{iW} + w_p \times 1 > 0.5,$$
$$U(\text{Looser}) = \sum_{i=1}^{m} w_{qi} Q_{iL} + w_p P_L$$
$$= \sum_{i=1}^{m} w_{qi} Q_{iL} + w_p \times 0 \leq \sum_{i=1}^{m} w_{qi} < 0.5.$$

Thus, the Winner will be awarded the contract independently of "quality" of his quality suggestion, and, respectively, he has no incentives to improve the latter (with the stated above remarks). This property is not good for public procurement contracts and unacceptable for the long-run public-private partnership agreements.

However, when and why does the supplier can ex ante know that he has the single rival and he is a price (or quality) "leader" toward to him? Some of such cases are described below:

1. The market structure is the differentiated duopoly.
2. There is a corruption, and public buyer, who has received the single bid by the end of submitting time, asks the other supplier of lower-quality goods submit the bid at lower price.
3. There is collusion, and the second supplier is a dummy bidder.

It is clear that in the case of two awarding criteria of different weights, the applying of the highest bid–lowest bid scoring rule is very risky, because one of them will be more than 0.5.

Thus, if the regulator prescribes the applying of discussed rule, she must demand from the public buyer to designate in the tender documentation:

- Three awarding criteria as minimum.
- Weights of the criteria less than 0.5.
- The minimum number of suppliers' bids for the tender to be performed (following the (UNCITRAL Model Law, 2011, 53-j)).
- That if two bidders have passed the selection stage, the other scoring rule has to be applied.

There is a special recommendation for the case of PPP. As it mentioned above, the laws on concession and PPP (# 115-FZ "On Concession Agreements" and # 224-FZ "On Public-Private Partnership, . . .") directly prescribe to apply the highest bid–lowest bid scoring rule in the form (8). Because there is a very long way to correct the law, it would be better to give some discretion power to change the scoring rules to the executive power (in RF, Ministry of Economic Development).

We finish with the consideration of the case, in which the corrupt public buyer has preselected tender's winner – his favorite. The public buyer has tried to restrict the competition in the tender, receives the bid from the favorite, and is going to award him the contract when, unexpectedly, the other supplier submits the bid. We assume that the latter has the advantage in one of the quality criteria toward to the favorite.

Since envelops (or electronic data) are still sealed (are closed), the corrupt buyer does not know what the total score of second bidder will be but knows that the undesirable supplier has the advantage in the value of specific criterion (for definiteness, quality one) toward to the favorite ($q_W < q_L$, we have reserved the index $W$ for the favorite and $L$ for the undesirable supplier). Thus, the contribution of this criterion into the total score will be $w_q \times 1$ for newcomer and $w_q \times 0 = 0$ for the favorite (where $w_q$ is the weight of the criterion).

Being afraid of the corrupt transfer losing, the public buyer asks the third supplier (or asks favorite to find such supplier), we call him the Dummy one, to submit a bid with $q_{dummy} < q_W < q_L$ (and values of other criteria, which do not change the corresponding scores of the favorite; that is possible since favorite's bid is known to the buyer). After that, the contribution of the criterion into the total score will be still $w_q \times 1$ for the newcomer and, according to (9), $w_q \times \frac{q_W - q_{\text{dummy}}}{q_L - q_{\text{dummy}}}$ for the favorite.

Thus, in the case of applying highest bid–lowest bid scoring rule, the corrupt buyer can use his discretion power to increase the total score of bid of the supplier selected by him for the organizing of the corrupt transfer.

There is a simple way to combat this type of the public buyer's *mala fide* behavior: the suppliers' bids must be submitted to the third party. In the Russian Federation, the role of such third party can play (but doesn't play now) the electronic trade platforms which had been established some years ago for providing of electronic auctions.

## Linear Scoring Rule without Threshold

In 2009, the highest bid–lowest bid scoring rule, which had some undesirable properties (subsection "Highest Bid–Lowest Bid Scoring Rule"), had been substituted for public procurement tenders with the linear scoring rule (Table 2).

**Scope of Some Scoring Rules Applying, The, Table 2** The Russian legal basics of the linear scoring rule

| # | The legal act | Validity | |
|---|---|---|---|
| | | From | To |
| 1. | The Government Decree #722 | 01/11/2009 | 01/01/2014 |

For the assessment of price proposals of suppliers, the linear scoring rule without threshold was selected. The regulator definitely knew that in the international practice, this rule is applied with the threshold, since in the assessment of delivering time she left the choice of rule, with or without threshold, at the discretion of the public buyer. However, there were, as minimum, two reasons against setting up the price threshold. Firstly, as it was stressed above, to define the price threshold, the buyer has to bear some additional costs. Secondly, the bidding below the price threshold does not give to the supplier additional points, and he has no incentives to do so. It doesn't fit the modern Russian public procurement policy, which, from its beginning, was sharply aimed at the budget cuts, as it was reflected, in particular, in the title of Presidential Decree # 826, which was the basis of the public procurement system of the Russian Federation in the period 1997–2006: "On urgent arrangements to prevent corruption and budget cuts in the organization of purchasing goods for public needs."

Let us consider the linear scoring rule without threshold, which was introduced for the price bids assessment by the Government Decree #722:

$$P_i = \frac{P_0 - p_i}{P_0} \times 100, \quad 0 \le p_i \le P_0. \qquad (10)$$

where the reserve price $P_r$ (Formula 6) was substituted with the initial price of contract $P_0$, which, according to the Russian legislation, must be pointed out in the solicitation to the tender and cannot be exceeded in the suppliers' price bids.

Formula 10 assigns price score to the supplier's price bid which is just equal to the price discount,

and we can reasonably assume that the examined rule must generate two different strategies of suppliers: to bid aggressively on price or to bid aggressively on quality (and do not give any price discounts).

The first strategy does not fit well with the antidumping mechanism of the regulation; the second one demands the mechanism of rejecting of abnormal quality bids. The latter tool is not easy to implement: *mala fide* public buyers usually can justify that the selected awarding criterion, which gives any necessary advantage to preselected supplier, is objective and does not restrict the competition.

Let us consider how the introduction of linear scoring rule without threshold had influenced the effectiveness of the tender procedure. Given the fact that the rule was introduced in late 2009, we have compared the average price reduction at the contests, which took place in the Russian Federation in 2008 and 2010 (with exception of purchases of municipal customers). According to the Federal State Statistic Service, the average price reduction in 2008 was about 7.63%, just as 2 years later – 4.09%.

Thus, the substitution of the highest bid–lowest bid scoring rule and highest/lowest bid scoring rule, which was valid till the November of 2009 too, with linear scoring rule without threshold dealt a heavy blow to the Russian public procurement system.

Finally, we will discuss the assumption of the existence of two strategies of suppliers in the conditions of the linear scoring rule without threshold, which was stated above. To study the reaction of the public procurement system on the incentives, generated by the rule, a statistical analysis of the results of contests, declared by the healthcare organizations of St. Petersburg in 2013, the last year of the rule line, has been performed. That year 143 contests were declared with the level of competition that reflected in the following table (the number of contests is relatively small because the public buyers must purchase all the drugs through the price auctions only) (Table 3).

**Scope of Some Scoring Rules Applying, The, Table 3** The level of competition in the contests of St. Petersburg healthcare organizations

| | |
|---|---|
| Total number of contests (lots), from them | 143 |
| All bids were rejected | 16 |
| The selection stage passed single supplier | 93 |
| The selection stage passed two suppliers | 18 |
| The selection stage passed more than two suppliers | 16 |

The statistical analysis of price discounts in the contests has revealed that the average price reduction was 5.28%, while in the 50% of contests, the price was reduced by less than 0.5% and 75% – less than 5%. In turn, 5% of contests gave the price reduction more than 31.76%.

Thus, we can conclude that in the more than 50% of contests, there were practically no price discounts, the winners of more than 5% of contests submitted dumping bids, and, correspondingly, on the market in question, public buyers

**Scope of Some Scoring Rules Applying, The, Fig. 5** Two strategies of suppliers in the conditions of the linear scoring rule without threshold

are more inclined to refuse to reduce prices (Strategy 2, Fig. 5) than to the dumping (Strategy 1, Fig. 5).

Thus, we can see that the linear scoring rule without threshold cannot be recommended at all and, in the case of assessment of price bids, it is natural to introduce threshold and put it not less than upper level of abnormal bids (i.e., in the modern Russian public procurement legislation, the bids with price discount more than 25% are considered to be abnormal bids; hence, we can set up $P_{thr}$ equal to $0.75P_0$).

The linear scoring rule without threshold was valid in the Russian Federation about 4 years and from the beginning of 2014 was substituted with highest/lowest bid scoring rule, which has applied for the assessment of the all tender criteria.

## Conclusion

In this section, we will discuss the importance of the lessons that other countries could extract from the Russian experience in applying scoring rules. The paper's findings can be significant for the developing countries with the similar institutional environment. On the other hand, the low competition in tenders, which in Russia is stem from corruption and/or weak regulatory impact assessment, in developed countries may be due to other causes: special structure of the market, state capture, etc.

There are some traps in applying highest bid–lowest bid scoring rule in the conditions of low competition in tenders (in particular, on the duopoly markets): weights of the criteria cannot exceed 0.5 and, respectively, the total number of criteria must be three or more. In this case, the *mala fide* agent, for example, cannot put $w_p > 0.5$ and award contract to preselected low-cost supplier for kickbacks.

In turn, the linear scoring rule without threshold deprives the suppliers of incentive to price discounts or, contrary, forced them to dumping. In the framework of this rule, *mala fide* public buyer can easily award contract to preselected supplier for kickbacks or another reason, establishing the specific quality criterion adjusted for him. Thereby, the linear scoring rule without threshold cannot be recommended at all; it is natural to introduce threshold and put it equal to abnormal bid threshold or higher.

At the present time, the highest/lowest bid scoring rule is used in Russia; however it demands an additional time to identify advantages and disadvantages of its applying in the specific institutional environment.

# Seaweed Farming in the Solomon Islands

Suwastika Naidu and Atishwar Pandaram
The University of the South Pacific,
Suva, Fiji Islands

## Synonyms

Kelp; Policy; Scum; Small island developing countries

## Definitions

*Fiscal Policy*: the use of government revenue and expenditure to stabilize the economy.

*Monetary Policy*: is the use of short-term borrowing or monetary base to target inflation rate or interest rate so that price could be controlled.

*Transmission Mechanism*: refers to the path through which the micro- and macroeconomic stimulus translates into output.

## Introduction

Seaweed farming is one of the sustainable industries, not only in the Solomon Islands but in a number of the Pacific Island Countries. There are numerous opportunities for expansion of the seaweed exports from the Pacific Island Countries. According to the Solomon Island Times (2013), there are many opportunities for value adding of seaweeds from the Solomon Islands. There are two important advantages of value adding seaweeds. First, the price of processed or semi-processed seaweed is higher than that for unprocessed seaweed. If prices are high, seaweed farmers will benefit as their total revenue from seaweed farming will increase. Second, there may be new applications of processed or semi-processed seaweed. As a result of this, there will be new market opportunities, and Solomon Islanders can benefit from these.

There are many advantages of seaweed farming in the Solomon Islands (Solomon Islands Times 2013). First, seaweed farming provides a source of income-generating opportunities for the local farmers. In an era of land tenure issues, seaweed farming can be used as an alternative to land farming. Second, seaweed farming in the Solomon Island requires less capital investment and is more cost-effective than other industries, such as the tuna industry. Third, seaweed has greater storage life. If seaweed is stored properly, farmers can keep dried seaweeds for at least 6 months.

The main aim of this write-up is to examine the socioeconomic potential of seaweed farming in the Solomon Islands by using a policy perspective. There are two reasons for conducting this study. First, to the best of my understanding, none of the existing studies have used a policy perspective to examine the socioeconomic potential of seaweed farming in the Solomon Islands. Second, this study is particularly important to the academics and policy makers who are interested in enhancing the growth of the seaweed industry.

## Overview of Seaweed Farming in the Solomon Islands

Seaweed farming has great potential for small island emerging economies such as the Solomon Islands. The history of seaweed farming in the Solomon Islands dates back to the 1980s. The first seaweed farming trials were conducted in the Solomon Islands by the Overseas Development Agency. Two main areas were targeted for seaweed farming trials. These two areas were Rarumana village and Vona Vona Lagoon (Kronen 2013). Initially, the planting materials for the *Kappaphycus alvarezii* were imported from the Fiji Islands to be used for seaweed farming trials.

Due to fish grazing, seaweed farming trials were not successful at the Vona Vona Lagoon. In the year 2000, the Ministry of Fisheries and Marine Resources collected seeds from the Vona Vona Lagoon, and in the year 2001, seaweed growth trials were conducted in Rarumana village (Kronen 2013). The growth trials conducted in Rarumana village resulted in 600 kg of seaweeds produced in 2002. As a result of this, the Rural Fishing Enterprise Project started seaweed farming in the Solomon Islands (Kronen 2013). By the year 2005, there were 130 (30% of the national seaweed farmers) seaweed farmers in the Rarumana and Shortland Islands and 300 (70%) seaweed farmers in the Wagina and Choiseul Province (Kronen 2013) (see Fig. 1).

The major boom in the seaweed farming in the Solomon Islands occurred by the mid of year 2005 when the Solomon Islands seaweed industry received major development assistance from the European Union to fully commercialize the seaweed industry (Kronen 2013). With the help from

**Seaweed Farming in the Solomon Islands, Fig. 1** Percentage of seaweed farmers in the Rarumana, Shortland Islands, Wagina, and Choiseul Province. (Source: Created by the author of this write-up, (2015))

this fund, the seaweed farming in the Solomon Islands expanded to Malaita, Ontong Java Atoll, and the Reef Islands (Kronen 2013).

## Production of *Kappaphycus alvarezii* in the Solomon Islands

One of the main commercial aquaculture seaweed species in the Pacific Island Countries is *Kappaphycus alvarezii.* This seaweed is farmed in four Pacific Island Countries, namely, Solomon Islands, Kiribati, Fiji, and Papua New Guinea (Gomez 2014). There are two reasons for promoting the *Kappaphycus alvarezii* farming in the Solomon Islands. Firstly, *Kappaphycus alvarezii* farming is less capital intensive; therefore, lower level of capital investment is needed. Secondly, *Kappaphycus alvarezii* farming is similar to the traditional aquaculture farming methods used in the Solomon Islands. As a result of this, less training and development is required for *Kappaphycus alvarezii* farming. The production of *Kappaphycus alvarezii* increased from 75 mt in the year 2004 to 1700 tonnes in the year 2013. Production of *Kappaphycus alvarezii* in the Solomon Islands has increased from 75 mt in the year 2004 to 1700 mt in the year 2013 (see Fig. 2). This significant increase in *Kappaphycus alvarezii* production has been the result of continuous support provided by the Solomon Islands Government and donor agencies.

In addition to *Kappaphycus alvarezii*, there are other species of seaweed that are farmed in the Pacific Island Countries. Some of the edible species of seaweed that are farmed in the Pacific Island Countries are *Cladosiphon*, *Caulerpa*, *Codium*, and *Gracilaria* (Gomez 2014). The production of seaweeds in the Solomon Islands increased from 40 mt in the year 2003 to 1792.2 mt in the year 2013. In this decade, the production of seaweeds in the Solomon Islands has increased by 4380.05% (see Fig. 3).

## Socioeconomic Benefits of Seaweed Farming in the Solomon Islands

There are many socioeconomic benefits of seaweed farming in the Solomon Islands. Both local and international communities and the Solomon Islands Government have benefitted from seaweed farming. Some of the socioeconomic benefits of seaweed farming in the Solomon Islands are identified and discussed below (Kronen 2013):

- Seaweed farming provides income to households. The survey conducted by Kronen (2013) found that out of 209 households studied in Wagina Island, Choiseul Province, 42.5% mentioned that seaweed farming is a source of income for them. The income that they receive from seaweed farming helps in meeting daily household financial expenses.
- Seaweed farming is similar to traditional farming methods. It is one of the sustainable forms of farming in the Pacific Island Countries. In addition to this, seaweed farming is environmentally friendly and economically viable.
- Seaweed farming has provided capacity-building opportunities to locals. Solomon Islanders have been able to sharpen their skills and talents by attending workshops that are organized by the Ministry of Fisheries and Marine Resources.

**Seaweed Farming in the Solomon Islands, Fig. 3** Production of seaweeds in the Solomon Islands. (Source: Created by the author of this write-up (2015) by using information from the Ministry of Fisheries and Marine Resources 2009). Note: Data for year 2009–2013 were missing; therefore, the author of this write-up has estimated data for these years

- Seaweed farming earns foreign exchange earnings and reduces the balance of trade problem that is faced by many Pacific Island Countries. The Pacific Island Countries have been recording high annual imports relative to annual exports. Seaweed farming is a source of government revenue, and this revenue is used to reduce budget deficit problem that is faced by many Pacific Island Countries. The marine resources of the Solomon Islands are the second largest foreign exchange earner (Food and Agriculture Organisation 2005). In the year 2013, there were four seaweed companies exporting seaweeds to France, Vietnam, and

**Seaweed Farming in the Solomon Islands, Fig. 4** Seaweed exports by different companies in the year 2012 and 2013. (Source: Developed by the author of this write-up by using information from Gomez 2014)

China. These four companies were (1) Solomon Seaweed, (2) RK Marine, (3) Chen Zhen, and (4) HJJ. Figure 4 shows the seaweed exports from the Solomon Islands by different companies in the year 2012 and 2013.

Figure 4 shows that there are two companies who are the highest exporters of seaweeds. These two companies are the Solomon Seaweed and RK Marine.

## Socioeconomic Problems Faced by the Seaweed Industry of the Solomon Islands

There are many socioeconomic problems that have affected the seaweed industry of the Solomon Islands. Some of these problems are identified and discussed below (Kronen 2013)

### Volatility of Farm Gate Prices

Volatility of farm gate prices has always affected the seaweed industry of the Solomon Islands. This volatility of the farm gate prices is caused by changes in the prices of raw materials used in the production of seaweeds, earthquakes, and other natural disasters. In the year 2006, the farm gate price of seaweeds dropped from SBD2.00/kg to SBD1.50/kg (Kronen 2013). This decrease in the farm gate price was caused by changes in international fuel prices. The economic intuition behind this phenomenon is that if international fuel prices increase, the price of seaweeds in the international market will increase. If prices increase, demand will fall resulting in the decrease in farm gate prices. Later on in the year 2007, the Solomon Islands experienced a devastating earthquake that reduced seaweed production by 20–30% (Kronen 2013). As a result of this, the prices of seaweed increased in the year 2007 by 106.67%. This increase in the seaweed prices benefitted the local seaweed industry of the Solomon Islands. However, the earthquake in the year 2007 adversely affected the livelihood of local seaweed farmers (Kronen 2013).

### Farmers Lack Innovative Skills

Seaweed farmers in the Solomon Islands lack innovative skills to improve the seaweed industry of the Solomon Islands. Some of the areas in which further skill development is required are value adding and semi-processing of seaweeds. Currently, there are no value adding and semi-processing of seaweeds done in the Solomon Islands. All phases of the production process are accounted for by the family production units (Kronen 2010). It is essential that the seaweed farmers have an entrepreneurial attitude and think of innovative ways of improving the

seaweed farming in the Solomon Islands. By value adding seaweed, numerous export opportunities will arise. Consequently, the seaweed industry of the Solomon Islands can increase their market share by venturing in new export markets.

### Poor Data Recording and Processing at the Production Site

Good data keeping and recording is needed to improve the production of seaweed in the Solomon Islands. The seaweed farmers need to collect and record high-quality data on seaweed prices, sales, and international and local demand in order to boost the production of seaweed in the coming period. Operations decisions related to scheduling, planning, and organizing of raw materials and resources have to be made on good-quality data collected from the production sites.

### Constraint by Lack of Extension Support

Due to financial constraint, the Government of the Solomon Islands is not able to provide full extension support to all seaweed farms. As a result of this, the seaweed farmers have to look for extension support elsewhere in order to enhance seaweed production (Kronen 2010). Some of the forms of extension support that is needed by seaweed farmers are finding new sites where seaweed farming can be expanded and effectively communicating best seaweed farming methods to the policy makers.

## Actions for Future Growth Potential

Seaweed farming can be expanded in many areas in the Solomon Islands. However, due to high cost of boat transportation, this expansion is limited. Seaweed farmers in the Solomon Islands should expand seaweed farming in areas where there is favorable physical and socioeconomic conditions. There is also future potential for semi-processing and processing of seaweeds in the Solomon Islands. Solomon Island seaweed farmers will be able to fetch higher prices if they are able to value add seaweeds before exporting it to the international market (McHugh 2006). Solomon Islands have been exporting high quality of carrageenan, but there have been some quality problems related to impurities and level of moisture content in the seaweed. If these quality issues can be addressed, the seaweed farmers will be able to increase their revenue by fetching high international prices for seaweed exports (McHugh 2006).

## Policy Implications

### Fiscal Policy Effectiveness and Non-fiscal Measures

Fiscal policy is the use of government expenditure or taxation to stabilize the economy. Governments may increase expenditure in order to increase the economic growth rate (Mountford and Uhlig 2009). The most effective policy instrument that may help the seaweed industry is fiscal policy and non-fiscal measures. There are two fiscal policy instruments that are used by the policy makers to stimulate the economy. These are taxation and government expenditure. The Government of the Solomon Islands has used fiscal policy in the past to expand the seaweed industry of the Solomon Islands. As a result of this, seaweed production in the Solomon Islands has accelerated. In addition to this, the Government of the Solomon Islands can use non-fiscal measures to enhance the seaweed industry of the Solomon Islands. Some of these non-fiscal measures include:

- Providing entrepreneurial training to seaweed farmers
- International sharing of ideas
- Providing more extension support

### Monetary Policy Ineffectiveness

Monetary policy is the use of interest rate and money supply to stabilize the economy (Devereux and Engel 2003). Monetary policy may not be effective to boost the seaweed industry of the Solomon Islands. There are two reasons for this. First, the financial sector of the Solomon Islands is underdeveloped; therefore, the effect of changing short-term interest rate may not

stimulate the seaweed industry of the Solomon Islands. Second, many seaweed farmers in the Solomon Islands rely on international development assistance and government support in order to expand the seaweed industry. Since these farmers are poor and are hardly able to meet the banks requirements for loan approval, they rely heavily on government support and international development assistance to boost the seaweed industry.

## Suggestions for Way Forward

The seaweed farming of the Solomon Islands has greater potential than what it has achieved to date. It is clear from the above discussions that the seaweed industry of the Solomon Islands provides numerous benefits to the local communities (Kronen 2013). Albeit the seaweed farming is an important industry in the Solomon Islands, it is still constrained by numerous problems. Quick government intervention is needed in order to fully tap the seaweed industry of the Solomon Islands (Kronen 2013). The seaweed industry of the Solomon Islands can become internationally competitive provided a close review and synthesis of the value chain of the seaweed industry is undertaken. There are many opportunities for further value adding of the raw seaweeds before these are exported to the international markets (Kronen 2013). Value adding can be in the form of drying and semi-processing of seaweeds. The socioeconomic aspects of seaweed farming need to be inculcated in the government strategies so that sustainability of the seaweed farming is maintained. The technical efficiency of the seaweed farms needs to be improved so that output per hectare of farm size also improves (Kronen 2013).

## Conclusion

The main aim of this write-up was to examine the socioeconomic potential of seaweed farming in the Solomon Islands. This write-up highlighted that there is greater potential for the seaweed farming in the Solomon Islands. With the help from the government and donor agencies, the technical efficiency of seaweed farms can be improved. Additionally, a retrospective analysis of the effectiveness of government policies in the Solomon Islands shows that only fiscal policy may be effective in stimulating the growth of the seaweed industry of the Solomon Islands. The effectiveness of monetary policy is dimmed as the financial sector of the Solomon Islands is underdeveloped. For monetary policy to be effective, the financial sector has to be fully developed so that monetary policy transmission mechanism can be efficacious.

# Secession Bid in the Southeastern Nigeria: Issues and Prospects

Victor Chukwugekwu Ebonine
Department of Political Science, University of Benin, Benin City, Edo State, Nigeria

## Synonyms

Agitation; Biafra; Nigeria; Secession

## Introduction

The right to self-determination is an internationally recognized one. In fact, in recent times, countries such as South Sudan have been allowed the right to self-determination while others are at the verge of either consideration by the international community such as Western Sahara and Palestine or still mounting pressures to be heard for consideration such as the Peoples Republic of Biafra and Catalonia. Glaringly, there are always issues underlying separatist agitations within the state in which the separatist region seeks separation. These issues could range from age-long marginalization and alienation, perceived injustice, exclusion from national commonwealth, insecurity, trauma, and victimization (Smith 2005). In Nigeria, the character of the state seems to have emboldened some regions and birthed "fearless" and "militant" personalities such as Chief Nnamdi Kanu and Sunday Igboho who led their people in the southeast and southwest, respectively, in the agitations for self-determination or simply called, secession.

Southeastern region of Nigeria is predominantly inhabited by the Igbos who happen to be industrious, innovative, and dogged in their quest for survival. Hence, they have been dubbed the *Japan of Africa* (Ezugwu 2018). However, amid sheer abandonment and neglect in the scheme of things even as they are one of the three major ethnic groups in the country culminated into the Civil War that claimed many lives both on the sides of Biafrans and Nigerian soldiers. With promises of reconciliation, rehabilitation, and reconstruction that later characterized Gowon's administration, the agitation subsided. However, since the turn of the democratic regime in 1999, the agitation has resurrected and peaked in 2015 when the leader of the Biafra agitation, Nnamdi Kanu, was arrested and charged to court for various offences bordering on treason.

This entry seeks to interrogate the secession bid of the Igbo people: periscoping the history, contentious issues, and consequences of secession agitations of the Igbos in Nigeria while leaving useful recommendations that would address the phenomenon.

## The Provenance of Secession Agitation in the Southeastern Nigeria

The issue of secession agitation in Nigeria could be traced from the colonial period when the seed of discord was sown and nurtured. Before the advent of the British, the autonomous communities in what is today known as Nigeria existed peacefully and cooperated with one another while also preserving their distinct cultures and traditions. Except for few intercommunal clashes and conflicts that were resolved based on existing traditional laws, customs, and dialogues, the people lived in harmony. The British, with the mindset of expropriation, truncated this existing harmony by lumping the Northern Protectorate and Southern Protectorate to become the Protectorate of Nigeria in 1914 (Tamuno 1970) after they had merged the Colony of Lagos with Southern Protectorate in 1906. As a result, there was a forceful merger of over 250 ethnic groups with distinct cultures, traditions, perceptions, identities, religions, and even political classes. Although the adoption of regionalism heralded regional developments, the various clashes evident through the years of colonial rule laid testament to the fact that these people would not cohabit together in the name of Nigeria. The political parties that were formed following the introduction of elective principle became ethnic based as the Igbos dominated the National Council of

Nigeria and the Cameroons (NCNC), the Yorubas dominated the Action Group (AG), while the Hausas/Fulanis dominated the Northern People's Congress (NPC). With the exodus of the British from the country and attainment of independence in 1960, nation building became a herculean task.

Nation building encapsulates patriotism, trust, and feelings of oneness in the mid of diverse ethnic groupings. The years leading to and after independence was tense as the personalities of the leaders of the three major political parties clashed leading to military interruption of the supposed nation building project in 1966. Indeed, it is worth noting that foundation of Biafra agitations could be said to have been laid as a result of the 1966 military incursion. Given that the January 15, 1966, military coup plotters and executioners led by Kaduna Nzeogwu were mainly of Igbo extractions and those killed were mainly from other tribes, especially the northern part of the country which is dominated by Hausa/Fulanis, suspicion of the real intention of the plotters became evident.

This suspicion was further fueled by the unwillingness of Aguiyi Ironsi who benefited from the coup as the head of state to bring the plotters of the coup to book (Duruji 2012). In his favored unitary system and to neutralize possible counteractions from other tribes, he decided to promote mostly soldiers from Igbo extraction to the rank of lieutenant general to help execute his policies and secure his government. This decision would later culminate into political violence in major cities of Nigeria including Kano, Katsina, and Maiduguri. The resultant effect of the political violence was the countercoup that claimed the lives of top-ranking Igbo officers including Aguiyi Ironsi (Ibeanu et al. 2016). The North once again regained dominance under the leadership of Yakubu Gowon.

The swiftness by which Gowon reversed the Unification Decree promulgated by Ironsi coupled with the fall out between him and Ojukwu, the then leader of the Biafra, on the issue of seniority in the army made Civil War inevitable. As Igbos in the North were daily massacred in their numbers with little or no reactions from the central government, but instead, it embarked on the journey of region depletion by creating 12 states to weaken Ojukwu's stronghold in the southeast; Ojukwu asked the Igbos to return home and declared the State of Biafra on January 1967 (Obasanjo 1980). The war which lasted for more than three years would result in millions of deaths including children and women, leaving an indelible mark on the journey of construction and consolidation of national unity and integration in Nigeria. This was exacerbated by the failed promises of the government of Gowon and successive governments to embark on rehabilitation, reconstruction, and reintegration of the Southeastern region. The region appears to have been skipped from Nigerian coverage on development.

## The Anatomy of Post-Civil War Biafran Agitation

Every war has a victor and vanquished even though the winner and the loser may not be expressly declared in order to heal the wounds sustained during the war. The declaration by Gowon of "no winner, no vanquished" was plausible but to say the least, empty as the government failed to match this declaration with actions needed to pacify the losers who were still traumatized by the outcome of the war. As a result, a renewed quest for Biafra resurfaced with eventual creation of the Movement for the Actualization of the Sovereign State of Biafra (MASSOB) in 1999 by Ralph Uwazuruike, a lawyer. The movement which was tailored toward the philosophy of nonviolence of Mahatma Gandhi began to gain relevance as it marshaled its 25-stage plan in its quest to realize Biafran dreams. In all of these, the government remained aloof and unwilling to look into the grievances of the people in the region only to hasten the arrest of the leader of the movement, Ralph Uwazuruike, and his followers in 2005 and later charged them for treason as the quest for Biafra realization grew. They were later discharged and acquitted in 2011 as many hoped that the government would seize the opportunity to listen to the agitations of the people. However, amid apparent inactivity of the government,

another movement with similar objective emerged: The Biafran Zionist Movement (BZM).

The new movement established by a UK-based lawyer, Benjamin Onwuka, in 2010 voiced to give seriousness to the Biafran dream. To solidify its claims, the movement applied to the United Nations to be granted an observer status for the Republic of Biafra in 2012. The activities of the movement were met with stiff resistance from the central government and Onwuka and some of his followers were arrested by the Nigerian police and charged for treason (Oji 2016). Thinking that the agitators had been defeated, IPOB surfaced.

The Indigenous People of Biafra (IPOB), created By Nnamdi Kanu, is credited to have broken away from MASSOB and its deepened radicalism in the quest to actualize the vision of Biafran state has not gone unnoticed in recent years. Although the movement has existed before the current government, it is the present government that seems to have given aggressive stance on the activities of the movement. In one of the protests of the movement on December 2, 2015, two policemen and at least nine protesters, out of the thousands that had blocked the strategic Niger Bridge in the commercial city of Onitsha in Anambra State, were reported to have lost their lives (Nwanosike and Chris 2015). Aside this, there were reports that security forces had killed unarmed Biafran protesters in Aba, Onitsha, Port Harcourt, Owerri, and Asaba at different times (Nwankwo 2016; Amnesty International 2016). Yet the government has not deemed it necessary to probe extrajudicial killings reported to have been carried out by the security forces at different times.

The fearless posture of Nnamdi Kanu and his broadcasting through Radio Biafra further fuel the agitation, strengthening the collective resolve of the movement to continue the agitation undeterred. This prompted the government to arrest Nnamdi Kanu and other members of the movement on 19 October 2015 with charges of sedition, treasonable felony, and ethnic incitement. He was granted bail in April 2017 with stiff conditions which included not engaging in public discussions relating to Biafra. Believing that the conditions attached to his bail was a ploy by the government to bury the agitation, Kanu was seen nonviolently participating in public Biafran discussions. In a usual draconian manner which the government responds to issues especially under President Buhari, the Nigerian Army codenamed Operation Python Dance were deployed to invade Kanu's residence where they shot at people and arrested some IPOB members. As a result, the whereabouts of Kanu became unknown until 2018 when he resurfaced. Not satisfied with the actions taken by the army, the central government speedily proscribed the movement.

The actions of government on IPOB seem to be internationalizing the Biafran vision as sympathizers mainly from outside the country continue to criticize the draconian manner in which the government handles the issue. Government has not stopped brandishing lies against the activities of the Eastern Security Network (ESN), a security arm of IPOB as being responsible for elusive peace in the region even as some notable Nigerians have called on the government to thoroughly investigate the activities of herdsmen and northern bandits in the region (who have overtly gained control of the bushes, killing, kidnapping for ransom and raping farmers and ordinary persons in the region) who may be responsible for the unrest charactering the region.

The recent rearrest of Nnamdi Kanu on June 28, 2021, by the federal government–claimed Interpol has further laid credence to the level of insincerity of government as regards Biafra. Being a British citizen with insinuations that Kanu was arrested in Kenya further implicates both countries alongside the federal government. Although Britain and Kenya have denied having hands in Kanu's rearrest, one cannot deny the interplay between conspiracy and sabotage in the whole process.

## Reasons for Biafran Agitation

There are many factors responsible for recurring Biafran agitations. Firstly, there is the feeling of collective victimization among the Igbos (Ibeanu et al. 2016). This feeling was cultivated by the colonialists. According to the words of Chief

Nnamdi Azikiwe which echoed this feeling in his presidential address to the Igbo State Assembly in 1949, "it would appear that God has specially created the Ibo people to suffer persecution and be victimized because of their resolute will to live" (cited in Ibeanu et al. 2016: 11). From colonial period to postcolonial period, Igbos have been the victims of gruesome massacre in different parts of the country. For instance, in Jos attack of 1945, two persons died with several persons injured and properties vandalized. In Kano Riot of 1953, 46 persons were left dead and 205 persons injured (Martin 2001). The aftermath of the January 15, 1966, military coup led by Kaduna Nzeogwu led to the killings of over 3000 people on May 29, 1966 (Ibeanu et al. 2016). Various accounts indicated that over 50,000 Igbo were killed between 29 September and end of November 1966 (Ibeanu et al. 2016). The Nigerian Civil War recorded deaths of unarmed civilians including women and children. Yet, the killings and unwarranted destruction of properties belonging to the Igbos have not stopped.

Secondly, the level of political ostracism is high. This is more evident in the lopsided appointments made by the government which tend to favor other regions. There have been suits filed in respective of this ugly phenomenon but it seems the judiciary equally dances the same song played by the executive. Further, the Igbo elite have been apparently excluded from top political positions at the center, limiting the representativeness of the Igbos at the federal. Since independence, it is only an Igbo president that has not materialized among the three major ethnic groups in Nigeria even as the region settles with five states against six states in other geopolitical zones of the country. More worrisome is the interest-ridden 1999 constitution whose provisions are framed to favor other regions, especially the North. Even in the face of clamor for the change of the federally unitary, population – favored constitution to people-oriented, inclusive constitution that favors regionalism, the government has remained unwilling to heed to those clamors.

Lastly, the material condition of the people is another major reason for agitation. In fact, there is an ostensible contradiction between the perception of an Ibo by other tribes as industrious and wealthy people and the region itself. Therefore, apart from overt evidence of rising unemployment among highly intelligent and educated youths, neglect of the government to rejig schools in the region, rising cost of living, mortality rates, and decayed infrastructure such as roads and hospitals are other reasons. The Eastern markets have opened access for other regions to trade without government's intervention to make these markets come to international standards.

## Consequences of Biafran Agitation in Nigeria

Obviously, in the face of frequent clashes between the security forces and Biafran agitators, frequent killings and arrests of agitators, consequences are expected in the East and country as a whole. First, frequent clashes impact economic activities in the region. This is truer given that most of the clashes take place in the major cities of the region. The common masses in the region bear the brunt of hunger and starvation following from the economic distortions. Second, clashes can deter foreign investors. Investors crave for areas that would ensure safety of their lives and investments and guarantees ease of doing business. Third, Biafran agitations and the recurring clashes with security forces have the tendency to undermine national security. The government has been battling insurgency and banditry recently of which Fulani herdsmen have been fingered. Thus, call for secession can only divert government's attention from collective issues. Lastly, the bid for secession can undermine the Nigeria project of democratic consolidation. As a country that has witnessed many years of military interregnum, nation building is key and that will only be realized under a peaceful environment.

## Conclusion and Recommendations

The investigations of this entry revealed long years of what seemed to be sheer "hatred" of the Igbos from other regions as a result of their

dexterity in wealth creation, industry, skills in commerce, and drive for success in a healthy competitive environment. It is within the context of all these manifestations of hatred that violent agitations for secession which have at different times led to clashes between the agitators and security agents can be pictured. Based on the foregoing, the entry recommends the following as ways to address these recurring agitations.

First, government should dialogue with IPOB. Frequent attacks on the people and arrests of the leader of the IPOB will not yield any meaningful output. Consultation and dialogue would allow government know their grievances and sincerely address them.

Second, a new, inclusive, and people-driven constitution should be enacted that would capture people's wishes and return a progressive-driven, cost-effective regionalism in place of a conservative, costly federal system operated as unitary system by successive governments. The new constitution will also address the one state deficiency in the Eastern region.

Third, government needs to treat the region as others. The level of economic frustration, unemployment, infrastructural decay, and the menace of Fulani herdsmen should be tackled seriously. This will give the people in the region a sense of belonging.

Lastly, as stated earlier, the quest for self-determination is not a crime under international law. The new constitution should accommodate self-determination as a last resort to any region that feels marginalized and ostracized in the scheme of things.

# Sectarian Politics

Sadik Kirazli
Department of Political Science and Public Administration, Suleyman Sah University, İstanbul, Turkey

## Synonyms

Bias; Bigotry; Denominational; Discrimination; Factional; Fanaticism; Favoritism; Narrow--mindedness; Nepotism; One-sidedness; Parochialism; Partiality; Partisan; Preferentialism; Provincialism; Schismatic

## Definition

Sectarian is a word to describe something having to do with sects or minor groups. Sectarian, as an

S

adjective, is a characteristic of or adhering or confined to the dogmatic limits of a sect or denomination. Sectarian, as a noun, is a partisan, narrow-minded, or parochial or member of a group with a particular set of interests.

Sectarianism is narrow limits of tolerance of the gap between the ideal and the real (Gerlach and Hine 1968, p. 34). For Brewer, sectarianism is "the determination of actions, attitudes and practices by beliefs about religious difference, which results in their being invoked as the boundary marker to represent social stratification and conflict" (1992, pp. 358–9). More broadly, sectarianism is a form of discrimination, bigotry, or hatred arising from attaching importance to perceived differences between segments within a group, such as between different denominations of religion, class, regional, or sect of a political movement.

## Introduction: Sectarianism in the Middle East

Sectarianism is an undeniable phenomenon on both religion and social grounds. It had and still has a real impact in shaping societies and organizing social and political life. It is real in its implications in our everyday life. However, it is rather the result of observable political and socioeconomic developments that cannot be overlooked and reduced to simply identity groups. For example, whereas not all women are feminist, not all "Shi'ites" or "Sunnis" are sectarian in the Muslim world. In fact, the formation of "sects" as political groupings is undoubtedly the results of sectarian politics, or sectarianism, and not its cause.

In many countries in the Middle East and beyond, although religious and sectarian identities were numerous before the nineteenth century, sectarianism has not always existed. However, it was constructed in the early nineteenth century with the development of capitalism and the rise of nation states. At that juncture, the Ottoman Empire and Western colonizers played a significant role in the creation and the institutionalization of sectarianism through state institutions. For example, during the formation of the Iraqi government, the British colonizers had clearly favored Sunni Faisal, the son of their wartime Sunni ally Sharif Hussein, who had very little connection to Iraq and its people and have played a crucial role by excluding Shi'ite Arabs in shaping the country's power-sharing system. Similarly, in Lebanon the French colonizers had favored the Christian leaders in the advantageous of their "Christian" allies. In the Middle Eastern societies, sectarianism is experienced as an instrument for identification, discrimination, political organization, othering, or alienation.

## Sectarian Politics in Iraq

Sectarianism in Iraq is a historical legacy from the early nineteenth and twentieth centuries, when Iraq was a sectarian society divided predominantly between Sunnis and Shi'ites on the one hand and Arabs and Kurds on the other. In fact, Iraq is a country of various sectarian and ethnic groups, mainly the Shi'ites, Sunnis, Arabs, and Kurds in the Middle East where sectarian and ethnic conflict is often observed. As of July 2015, the population of Iraq was estimated by Central Statistical Organization to be 37,056,169 with most of them being Arabs (75–80%), followed by Kurds (15–20), and other ethnic groups including Turkmens, Chaldeans, Assyrians, Armenians, Mandaeans, Circassians, and Kawliya (5%) (according to Iraqi Constitution which was prepared in 2005). Turkmens are claimed as the third largest ethnic group and make up over three million (Park 2005; Kibaroğlu et al. 2009). Iraq is a Muslim-majority country and has a mixed Shia and Sunni Muslim population. Islam accounts for an estimated 95% of the population. It is estimated that 60–65% of Muslims are Shi'ites and around 32–37% are Sunnis. Non-Muslim population makes up 5%, and they are mainly Assyrian Christians, and other religions are Yarsan, Yezidism, and Mandaeanism (Central Intelligence Agency 2013). According to the Constitution of 2005, which was prepared in the post-Saddam period of Iraq, the Arabic and Kurdish are the two official languages of Iraq. The Turkmen and Syriac are two other official

languages in the administrative units in which they constitute majority of the population (Article 4, Iraqi Constitution).

The area comprising modern Iraq has been home to continuous successive civilizations at different periods in its history. During the Ottoman era, the region that has become Iraq was divided into three separate provinces (*vilayets*) as Mosul, Baghdad, and Basra. Those provinces roughly corresponded to the areas where modern Iraq's three major ethno-sectarian groups which are Sunni Arabs, Shi'ite Arabs, and Kurds lived (Al-Hasani 1956). But the boundaries of these provinces shifted on a number of occasions. When Ottoman Empire was ruling Iraq in the sixteenth century, most of southern Iraq was still Sunni. But this area gradually became a Shi'a-majority region between the 1750s and 1900s, while Sunnis in Iran were persecuted when the Safavid state adopted Shiism and forced people to convert to Shi'a Islam. Ottoman Empire throughout history left people in general to decide their own personal, religious, and sectarian lives, as long as they did not compete with them over power.

In the aftermath of the First World War, which broke out in 1914, Western colonial powers occupied the most Arab territories of Ottoman Empire and tried to stoke sectarian and ethnic sentiment, using the tactic of divide and conquer. In fact, those Arab territories were divided between France and Britain. At San Remo conference in 1920, the former Ottoman provinces of Mosul, Baghdad, and Basra were proposed to become a League of Nations Class A mandate under the authority of the United Kingdom, known as the British Mandate for Mesopotamia. However, the proposed mandate faced a firm challenge to be established, as a nationwide Iraqi revolt in 1920. Major centers of the revolt included present-day Mosul, Baghdad, Najaf, and Karbala. At that time, this revolt did not take a sectarian form but rather took a nationalist characteristic and form. The British presence in Iraq successfully united the various ethnic and religious groups, developing a powerful support for national unity. In fact, even though the revolt had cost many lives, for Iraqi people, it was the first step in the nation-state building. This unity would make a part of the founding myth of Iraqi nationalism. But different groups would use to assert their own roles in the foundation of the state, favoring their particular ideas about the meaning, identity, and interest of the new Iraqi political community (Tripp 2002).

Following the 1920 Iraqi revolt, an Iraqi autonomy was created with the Cairo Conference of 1921 and ratified via the Anglo-Iraqi Treaty of October in 1922. The Anglo-Iraqi Treaty was signed mostly as a result of the firm efforts of the coalition of both Sunni and Shi'ite Arabs. Since the sectarian battle between the Sunni Ottoman Empire and Shi'ite Safavid state at the Battle of Chaldiran in 1514, this nationalistic cooperation was very vital that would bring the creation of Iraqi monarchy. Even supposing that they were in solemn disagreement with the modern-time rulers of Baghdad about the overall direction of Iraqi politics, neither the Sunnis nor the Shi'ites at the beginning of the twentieth century presented any substantial separatist scheme. They united during the revolution and fought side by side against the British powers for the independence and creation of an Arab government.

However, during the formation of the Iraqi government, Shi'ite Arabs were virtually excluded from it. The British high commissioner appointed Faisal, the son of their wartime Sunni ally Sharif Hussein who had launched the Arab Revolt against the authority of Ottoman Empire, to lead the country as the first king of Iraq. Faisal was originally from the Hijaz area of present-day Saudi Arabia and who had very little connection to Iraq and its people. The British authorities also selected Sunni Arabs, who mostly close ideologically and politically to Faisal, for appointments to the government ministries, the senior state officials, and the officer corps of the armed forces. All these appointments created a Sunni dominance that would cause disquietude on Shi'ite Arabs. This factional discrimination is considered as a starting point for the existing sectarianism in Iraq. However, the British-control Sunni monarchy did not bring contentedness not only to the Shi'ite Arabs but also to the Sunnis. The area acquired by the kingdom therefore went through a period of political turmoil. This condition

continued until the complete independence was eventually granted to Iraqi people, and the Hashemite Kingdom of Iraq was established on October 3, 1932. However, the British succeeded to sustain its influence over the kingdom until the 1958 military coup that ousted the kingdom.

In postcolonial period, the "artificial" Iraqi nationalism that was created with a coalition of the Arabs, Kurds, Christians, Muslims, Sunnis, Shi'ites, and others who have been living in Iraq potentially acted as a mediator between these competing groups. Due to the competition between these groups, the political transitions in Iraq, however, have always been fraught. The transfer of power was often accompanied by a significant level of political violence. In 1958 the British-influenced kingdom was ousted, and the Republic of Iraq was created by a nationalist and secularist military junta headed by Abdel Karim Qassim, aiming to make the country completely an independent state. Qassim attempted to reverse the monarchy's pro-Western policies by beginning to form new alliances with the communist countries. This sharp and reversed change later led Qassim to be overthrown by the CIA-sponsored right-wing elements of the Ba'ath Party in 1963. However, this right-wing side of the party could not get enough power in the new government. So this situation led a series of coups and power struggles that plagued Iraq until 1968 when the left-wing of the party gained again a long-term power. This 1968 coup is considered as a "countercoup" that strengthened the influence of the Soviet Union in Iraq. Like many other Arab regimes, this left-wing dominant Ba'ath Party adopted pan-Arab nationalism and secular ideologies and ruled the country in a tyrannical and corrupt way. Especially with Saddam Hussein, the political transition became problematic due in part to the fact that incumbent head of state was obsessed with retaining political power for life. But the party regime did not take sectarian undertones when ruling the country until the Iranian Revolution of 1979. The regime even created a vacuum in the Islamic arena, by fighting moderate Islamist movements and leading extremist movements' emergency. Its hegemony continued until the invasion of the United States and its allies and the removal of Saddam Hussein from the power in 2003.

After the "countercoup," Iraq was ruled by the Socialist Ba'ath Party. However, socialism in Ba'athist parlance means Arab socialism. Arab socialism is different from the international socialist movement, opposing Marx's rejection of nationalism. It is defined as some form of nationalism than socialism. The Iraqi-led Ba'ath Party's key slogan refers to pan-Arabism and Arab nationalism. Even the 1970 Iraqi Constitution prepared by the Ba'ath Party stated that Iraq is in a transitional stage which is the time when the Arab people unite to establish one Arab nation. Arab socialism was by nature secular but borrowed some elements from Islam. Particularly, during the 1990s the Ba'ath Party claimed that the term "Ba'ath" comes from Islamic scriptures, and so all Muslims were Ba'athists even if they were not party members (Bengio 1998). In 1993, Saddam Hussein changed the party policy to encourage popular devotion to Islam within Iraqi society. But this new influx of religious involvement had sectarian undertones. The regime attempted to cloak itself in Sunni conservatism and sought to discredit Iran, by emitting that they were subscribing to a "heretical form of religion." This was perceived by Iraqi Shi'ites as being indirect attacks on their community.

Indeed, from the beginning of the nation building, Shi'ites were marginalized in the political and economic reconstruction of Iraq, and sectarian relations thus became problematic. But the Iranian Revolution of 1979 made a crucial turning point in sectarian relations in the Islamic world particularly in countries neighboring Iran. The establishment of Islamic Republic of Iran polarized opinions, mobilized sectarian identity, and further motivated many Shi'ites to stand up against the Sunni-dominated governments. Consequently, like regional regimes, Iraq's Ba'ath regime felt threatened by Shi'a Islamism and sought to discredit it in any way possible. In the post-1979 climate, the Ba'ath regime of Saddam Hussein favored the Sunnis and placed many restrictions on the Shi'ite majority. Saddam politicized Shi'a identity with its accusation of linkages between Iraqi Shi'as and Iran. However,

economic inequalities and unfair distributions of wealth have served to sour sectarian relations even if they were based on nonsectarian lines. In fact, the events since and related to 1979 increased the competition between the various ethnic and sectarian groups for state patronage and economic advantage. The competition which fostered intergroup tensions brought a Shi'ite uprising across Iraq's south region after the 1991 Gulf War. Saddam's Ba'ath regime violently quelled this uprising. But this uprising accentuated more the Shi'ites' perceived "otherness" and created the conditions of mass poverty, increased isolation, social breakdown, and exile.

The state's conflict was not only with the Shi'ites but also with other groups, in particular the Kurds. Indeed, sectarianism in Iraq was connected to a degree with nationalism and became an expression of the Ba'athist regime's nationalistic and cultural ambitions. Alongside of Arabs, the Kurds of the northern part of the proposed British Mandate also waged war against the British rule. However, after the creation of Hashemite Kingdom of Iraq, the Kurds pursued separation from newly created Iraq, aiming to establish their own nation-state. Their autonomy demand was even mentioned in 1925 by the League of Nations (Genève 1925). In the report of the *Council Resolution of September 30, 1924* submitted to the Council, the commission stated that the Iraqi kingdom must pay attention to the desires of the Kurds such as Kurds should be appointed as officials for the administration of the country, and Kurdish should be the official language of all the services and taught in the schools. But successive central governments did not demonstrate any meaning to implement their demands. The ignorance of the governments, consequently, brought the first full-scale Kurdish revolt that erupted in the time of Abdel Karim Qassim's government in 1961. Following the Ba'ath Party coup in 1968, although the new Iraqi government announced its intention to grant the Kurds a measure of autonomy and even signed a peace agreement with Mustafa Barzani, the leader of the Kurdistan Democratic Party, neither this government nor well ahead Saddam Hussein, reached a complete political accord with the Kurds. Rather Saddam directed its worst treatment at the Kurds, who often carried on a sporadic armed struggle for autonomy. When the Kurds revolted once again in 1988, Saddam harshly suppressed the uprising, by killing of more than 5,000 Kurds.

While Saddam's suppression continued during the 1990s, "no-fly zone" over Iraq was set up and patrolled by the United States and the United Kingdom, claiming to protect and establish a safe haven for vulnerable civilians of Kurdish in the north and Shi'ites in the south. Accordingly, these no-fly zones effectively divided the country into three regions. This set the stage for regional and/or ethnic separatism within the state. Indeed, every event and development in the struggles that ensued between the Ba'athist Saddam regime and the ethnic and sectarian parties were escalated in the direction of the American invasion of Iraq in 2003. However, the American occupation of Iraq further deepened sectarian tensions by promoting an ethnic and religious conception of Iraqi politics. Like European colonial powers, the United States had its own divide and rule policy, promoting Iraqi organizations founded on ethnicity, nationality, religion, or sect rather than politics. Especially, the American military administration deliberately deteriorated relations between sectarian communities by appointing Kurds and Shi'ites to police the Sunni towns. In the vacuum created by Saddam's withdrawal from the power, the Shi'ites took the control of Iraqi Transitional Government, while the Kurds emerged as a major regional player and have enjoyed effective autonomy in the northern Iraq. But the struggle over Iraq's new constitution and over the redistribution of oil resources, largely located in the south and the north of Iraq, deepened the sectarian divides and stoked the animosities.

The most essential outcome of the American invasion was the empowerment of Iraq's Shi'ite majority at the expense of the Sunni minority who had been ruling the country by ignoring the basic demographic reality on which any feasible power-sharing deal could be built. In the post-Saddam period, the long-term conflict between the Sunnis and the Shi'ites gained a new impetus with the first multiparty parliamentary elections in 2005. The Shi'ites turned their numerical superiority

into political advantage through elections which have broken up the long-standing power-sharing structure in the country, giving the Shi'ites a dominant position. The Sunni minority group, who had ruled the country since its independence, now became disadvantageous position in the parliament. Although the Iraqi Transitional Government controlled by the Shi'ite group has modeled the power-sharing structure of Lebanon and appointed even a number of Sunnis to some key positions in the government, the power-sharing in practice has become a power apportionment.

Consequently, the Sunnis have begun to complain about the sectarian behavior of the Shi'ite-majority governments that ruled Iraq after the United States' occupation. The Shi'ites appear to have taken revenge of the past. This claim was supported by a fact that the Sunni detainees were ostensibly discovered to have been tortured in a compound used by the Shi'ite government forces on November 15, 2005. This event helped fuel the hostility against the Shi'ites and in general fostered an internal interruption and massive level of relocation in the country. Indeed, the vengeful and discriminatory sectarian policies of the Shi'ite governments in the post-2005 era gave rise to a civil war that took place between 2006 and 2007.

In the upheaval of that civil war, a sectarian militant group that eventually came to be known as Islamic State (IS) was born and took anti-Shi'ite position. The IS has targeted Shi'ites particularly and others, those who do not support the ISS, in sectarian attacks by declaring them as apostates. Like the IS, also other extremist intolerant groups emerged, and therefore more sectarian manifestations began to appear in the region. Consequently, many Christians and secular Iraqis have fled the country, fearing the growing power of the extremist intolerant parties. In the emergence of these extremist groups, without doubt, the Western colonialism played a significant role because the Western powers backed certain minorities for their national economic and political interests. In return, those sectarian minorities sought protection against the majority groups or requested guarantees and special privileges that safeguard their interests. This fact is effective throughout Iraqi history.

## Conclusion

Sectarianism is an unavoidable fact in the political life of modern Iraq particularly after the Kurdish and Shi'ite uprisings and the fall of the Ba'ath Party in 2003. Following the civil war, some even claimed that if Iraq is divided into three independent states as Kurdistan in the north, Sunni Iraq in the center, and Shi'ite Basra in the south, the region could only have peace. However, this division does not appreciate the makeup of Iraqi society, because the three regions would quickly fall under the rule of violent sectarians and chauvinists. This breakup would only bring permanent wars in which the oil companies, the arms suppliers, and the warlords will be the winners. The economic distress, high unemployment, and general chaos of the American occupation have stoked the tensions in the country. Even though the American occupation ended in 2011 and the Shi'ite parties gained the power and established a government, the sectarian conflicts and competition between the various parties still continue. Because what the Shi'ite parties have done is to transform governance from dynastic rule to majority sectarian rule, even though the logic of the democracy does not necessarily recognize the right of a majority sect to rule. If a suitable political system is not chosen for the country, this conflict may even drag Iraq into a state of division and destruction. The sectarian and ethnic type of conflicts is destructive for all and undermines Iraqi national identity.

## Introduction: Social Movements

Social movements are generally defined as forms of collective activities, protests, and campaigns practiced by groups of people in order to affect public policies. They are collective challenges to elites, authorities, other groups, or cultural codes aiming at changing political and economic institutions in order to produce a better society (Tilly 1978; Tarrow 1994). These forms of collective actions emerge as informal networks, based on shared beliefs and solidarity, which mobilize around controversial issues, through the frequent use of various forms of protest.

Social movements indicate social demands, supports, or oppositions meaning that the existence of a social group is questioned and denigrated in terms of its worthiness. Once this sensibility exists, political rights and obligations lose their meaning for that discontented social group. Then, they organize social movements to affect social policies which they perceived as the sources of injustice and inequalities. These reactions must be directed and managed in a correct manner; otherwise, collective violence and terrorism may serve as a means to reach perceived goals and interests. This situation is described by Habermas (1973) as *legitimation crisis*, the inability of the state in persuading its citizens to obey its rules and obligations.

Studies on social movements clearly indicate that social movements are closely linked to public policies determined by governmental authorities. From the late 1960s onward, most countries in the world have experienced a surge of protests and demonstrations against government policies and social changes affecting quality of life (Can 2014). This link between institutional factors producing public policies and social movement development is formed according to state-civil society relationships. If the state is weak and civil society strong, there would be a constant but peaceful flux of protest from below. If the state is strong and civil society is weak, on the other hand, protests would turn into collective violence. This argument on the influence of the strength or weakness of states on social movement development is generally accepted by many social movement theorists.

## Public Policies and Social Movements

The scope of social movements allows us to analyze the extent to which people living in a specific

territory are incorporated into society. Individuals as members of a society claim three sets of rights (civil, political, and social) and the institutions through which such rights might be exercised (Tilly 2003). Shared rights are a basis of social unity which is achievable only by pursuing common good, although there are various condition-based individual interests. People can overlook their personal specific interests only on the condition that the society provides requirements such as a desirable social role and status. If these requirements are not met, individuals may not be willing to maintain their role or status in the community.

The sense of exclusion may also be a cause that leads people toward social movements. Social exclusion is a multidimensional process in which various forms of exclusion are combined, i.e., participation in decision-making and political processes, access to employment and material resources, and integration into common cultural processes (Madanipour 1998). Social equality, justice, and solidarity have always been at the core of social integration in the welfare state. Thus, the existence of a state can only be justified by virtue of realizing and maintaining these values through its institutions. The common satisfaction of a group flows from a sentiment of solidarity. People are aware that social solidarity serves for common interests of all involved parties, and therefore, they are eager to overlook their selfish aspirations.

The legitimacy of social rights and institutions must depend on mutual ethical obligations that exist between members of society and state authorities. Only the policies aiming at maintaining social justice can constitute a unifying identity. Therefore, state policies should encourage some kinds of collective activities by influencing the formation of groups, ideas, and demands (Skocpol 1985). A community should be constituted with ethical norms and values that consist of rights and obligations for individuals to support common interests. Otherwise, people may feel excluded from the society and create subgroups.

State actions shape individual or group attitudes and, accordingly, social trust and civic engagement. The effective democratic actions taken by governments trigger collective actions and make public administrations more efficient and responsive (Putnam et al. 1994). State policies encourage some kinds of group formation and collective actions by influencing the formation of groups, ideas, and demands. As seen in the French Revolution, the activities of the monarchical regime led some aristocrats to adopt revolutionary ideas. The comparison of the United States and Canada by Irene Bloemraad (2006) shows very clearly that immigrants' integration into society changes according to state policies. Efficient and honest state bureaucracies affect the success in social and economic development. If the state cannot provide a determinate basis for social integration, discontented groups may start to mobilize their oppositions and resort to violence.

Social movements are social arrangements in which people construct shared stories that hold them together. Such stories can range from excuses, explanations, and apologies for committed wrongs to appreciations and honors in the national histories. All these play a significant role in social integration. The state tries to strengthen common identity as a source of social integration and uses social policy to either strengthen loyalty to the state or to weaken oppositions against national unity and state authority (Parsons and Smelser 1957). Social policies developing and sustaining social unity are very important for the development of the welfare state because they have great influence on the degree of shared social identity to overcome the role of conflicting interests. A community can maintain its social unity by advancing social policies through its institutions (Durkheim 1997). As the unity of the community depends on strong social ties, the norms shaping the prospects for realizing social justice and paving the way for accommodating diversities should be generated through the institutions.

The most prominent attribute of a community is that its members are willing to help one another in times of need due to a sense of social solidarity. This attribute develops shared responsibility, mutual support, and cooperation in the community and constitutes a "we feeling" or a "sense of belonging" that shapes a common identity

(Böckenförde 2006). Once a group of community members is excluded from the mainstream of opportunities within the community, they start exercising their civil rights such as protesting authorities (Madanipour 1998; Ottmann 2010). In the long run, this will engender a strong effect on the structure of the community and the state. A sense of exclusion emerges in society, the equal distribution of economic resources is distorted, and social solidarity in that society is ultimately undermined, which, in turn, causes social movements.

The evolution of social movements is related to three main areas: territorial decentralization of power, functional dispersal of power, and characteristics of public bureaucracy (Kitschelt 1986). Decentralization of power refers to the distribution of central state power to local executives. The general assumption is that greater distribution of power enhances the level of attendance in the decision-making process of public policies. The greater the opportunities of access to the decision-making system, the more social movements tend to adopt moderate strategies (Della Porta and Diani 2006). Functional dispersal of powers ensures the greater division of tasks between the legislature, executive, and judiciary. Accordingly, the system provides more a secure environment to access to the decision-making process of public policies and decreases the attempts for forming social movements. The role of public bureaucracy in the evolution of social movements appears when there is structural fragmentation and a lack of internal coordination and professionalization are prevailing in the system (Rawls 1999). These institutional fragmentations and disorders halt the flow of public services and provoke individuals to organize in social movements.

## The Shift from Social Movements to Collective Violence

Social movements are conditioned by the social structure of the societies in which they develop. Intervention strategies also affect the form of social movements. National strategies set the informal and formal rules to handle the conflict. Societies adopting a strategy of inclusion (tolerant strategies) will produce unifying mechanisms that strengthen social solidarity. Societies practicing a strategy of exclusion (repressive strategies), on the other hand, will be open to polarization in the population, which breeds conflicts between opposing groups (Kriesi 1989). These conflicts emerge as social movements and may turn into violent activities if necessary measures are not taken.

Social movements are a form of collective behavior as the expression of real grievances over underlying social, economic, and political changes or lack of such changes that have appeared in society (Gurr 1970). Karl Marx and his followers saw the need for collective action to change public policies which produce inequality, injustice, and unfairness in society (Laqueur 1999). They mostly favored some forms of revolutionary collective action such as demonstrations and strikes. Violence might be acceptable for them to perform the certain intended change. However, the most systematic attempt to create an ideology of collective violence is that of Jean-Paul Sartre. Sartre was not only important because he took an extreme position concerning violence but because he opposed all liberal values and a liberal state or society. For him, the true motivational force of history is scarcity: "Each man is an enemy to every other because each is a dangerous rival in the struggle against scarcity" (Wilkinson 1979: 72).

Social movement activists generally resort to violence after the failure of legitimate methods which initially do not include violence. The groups victimized due to unfair social system, or its unchangeable structure, want to declare their grievances in a legal way first. But if the social authority does not accept this and prepare ground for the release of those grievances, collective action may turn into collective violence (Reich 1998; Senechal de la Roche 1996). If legitimate methods fail or are not permitted by the authorities, people may turn to violent methods as a result of feelings of rage and helplessness over the lack of alternatives.

The groups who feel excluded from society may react against the government in various

ways including violent methods. In such a case, states usually take a number of security measures restraining social rights and freedoms, which results in undesirable effects. Groups dissatisfied with the state's actions start questioning the legitimacy of social norms. Shared ideas and sentiments, which are the basis of social solidarity, are destroyed, and groups may pursue their own selfish interests by breaking their bonds with the state. Consequently, they may resort to collective violence causing social fragmentation and ultimately a condition of anarchy and social anomie (Durkheim 1897). Anomie is a breakdown of social norms, and it is a condition where norms no longer control the activities of members in society. Individuals cannot find their place in society without clear rules to guide them. Changing conditions as well as adjustment of life leads to dissatisfaction, conflict, and deviance.

As a result, anomie emerges in the society because of the inability of authorities to regulate social life for the members of the society. Individuals or groups who are exposed to undesirable activities by the government begin to react against the state by organizing social movements. If the state neglects their reactions, they resort to collective violence and terrorism. These propositions designate that violent collective action is the last legitimate choice of deprived and desperate individuals to achieve social change.

## Conclusion: Appropriate Intervention Strategies

Social movements call attention to significant problems in society reproduced by its institutions. From this point of view, social movements are seen as a tool for achieving a broader democracy. However, if their motivations and sources cannot be identified in a correct manner, they can turn into a tool to undermine the existing democracy. Social movements have two sides: the inner complexity of an actor and the actor's relationship with the environment. The structure of a society determines its capacity for the collective actions of social actors (McAdam 2003). Collective behavior emerges when the established structure cannot meet individuals' expectations. Public policies affect individual choices when participating in social movements. The political system needs to develop effective strategies in order to sustain social solidarity by providing the bonds that link individuals to the society.

Social movements are organized to change public policies that are recognized as unjust, damaging, or prohibitive by the social movement. As they get involved in activities which may disturb public order, governments have to respond with appropriate strategies for social movements without further constraining civil liberties. These strategies must be in accordance with the rule of law in order to maintain public order. If they are not in line with the law, governments lose public support and deepen grievances in society. Inappropriate intervention strategies applied by the authorities may result in polarization within society and pave the way for the enlargement of social movements. Ignoring the demands of movement activists, on the other hand, may encourage them to use violent methods in order to reach their defined goals.

Active communication is necessary to understand the psychology and concerns of social movement activists, which necessitates articulating positions by considering their motivations. Authorities, therefore, must question what they want to take for granted, learn from them, and try to develop appropriate strategies in order to transform their position through this dialogue (Habermas 1991). Authorities should ensure all members have equal distribution of social benefits. This increases the individuals' awareness of social solidarity and creates norms and rules that both harmonize and constrain the individuals' aims and interests. As a result, shared sentiments, common ideas, beliefs and practices, and mutual understanding flourish in the society.

Especially after the 1980s, a trend toward tolerance and dialogue has begun to gain importance as the methods for intervention (Della Porta and Diani 2006). These methods are used by following a series of pathways. First is authorities who are responsible for sustaining public order meet and negotiate with the representatives of movement groups. They try to reach a consensus on routes and conduct to be observed during social

movements. The characteristics (peaceful, radical, or violent) and aims (social, political, economic, etc.) of the group should be determined at this stage. In order to keep mediation with the group, their right to form or join movements must be guaranteed by the authorities. Then, violent groups must be separated from the peaceful groups without threatening their security and harming the flow of the movement (Can 2015). Agreements reached with the representatives of the movement are never to be broken, and the dialogue between group representatives and authorities must be kept until the social movements disband of their choice.

The practices of governmental institutions are rational insofar as they are consistent with the actors' beliefs, notions, and values. If there is no shared sentiment between parties, then the process of "communicative action" is broken (Habermas 1991). Therefore, moral education is necessary for the development of individuals and society at the same time. Shared ideas and sentiments that maintain and promote social solidarity prevail as long as the satisfaction of all the members of society continues. The social actors (official authorities or NGOs), therefore, should use moral education as a means to express and disseminate those ideas and sentiments. Otherwise, individuals follow their own interests and neglect their social obligation, which causes collective violence undermining social solidarity.

# Semiotic Theory and Public Administration

Christopher L. Atkinson
Walden University, Minneapolis, MN, USA

## Synonyms

Metaphor; Sign processes; Signification

## Definition

Semiotic theory in public administration is the application of analytical methods to discern how signs are used to convey meaning in the public sphere. Of particular interest is inquiry into the symbolic value inherent in political rhetoric, as well as administrative/organizational structures and decision-making.

## Introduction

Through political discourse, powerful images with political acceptance form a basis for policy action. Policy systems soothe public trepidation through symbols and appeal to conventionality that, above all, emphasize productivity and stability of the existing system. The public's level of engagement varies; as a collective, the public is relatively unmoved by the machinations of government or public policy, generally speaking, unless individuals are adversely affected. Affected individuals become active groups. Otherwise, docility allows spuriousness, beliefs, and unsupported appeals to baser emotions to go forward as "fact" for purposes of policy. Well-intentioned, nonspecific policy, created through an elaborate, commonly misunderstood system of agenda setting and access, has great value, but the nature of that value is not always well understood.

This entry explores semiotic theory and public administration. First, semiotics as a field of study is reviewed generally. The focus then shifts to the application of semiotic theory in public administration, as symbol in public policy and administration, and in the use of metaphor in the public sphere for advancing preferred policy agendas and legitimizing the enterprise of public administration. Examples from the literature incorporating the application of semiotic application are included.

## Semiotic Analysis and Public Administration

Semiotics has been defined as a "science of signs," a sign being "anything which denotes or means something to someone" (Kattsoff and Thibaut 1942, p. 475). Through semiotics, a deeper meaning of a term can be explored through "an investigation of its hidden meanings, its connotations as well as denotations. . . to uncover the basic structural elements of the meaning of a term . . . each element [acting as] a sign for the identification" (Tiefenbrun 2003, pp. 359–360). A sign is "something that stands for something else," and following Saussure, is a "unity of word-object, known as a signifier with a corresponding culturally prescribed content or meaning, known as a signified" (Berger 2010, p. 3). This connection is arbitrary and signs are dependent on what they are not and how they related to other signs, and not necessarily on any implicit meaning.

Charles Sanders Peirce saw a sign as "something which stands to somebody for something in some respect or capacity" (1958, quoted in Berger 2010, p. 9), giving the reference point a contextual aspect. Peirce's theory had three main premises: "first, a sign is not a thing; second, that everything can become a sign; and third, that things must act upon each other to create meaning" (Van Fleet 2011, p. 59).

Julia Kristeva suggested that "just like in the exact sciences, the models created in semiotics are, in essence, representations, and as such have tempo-spatial coordinates" (1969, p. 29); however, semiotics is not limited to representational objects. Setting aside the existence of large-T truth for a moment, this brings to light an important point: semiotics is a study of signs, and signs

are representations, not the things in themselves. Representations depend heavily on those making the representation and the apprehension of the representation on the part of the listener/reader, and/or any intervening interpreters. A sign-as-representation is so context-based that if the circumstance is not trustworthy, perception may be drawn to the notion that the representation being made is false.

Semiotic analysis in public administration is rooted theoretically in conceptual models of organizational decision-making, including the garbage can model of decision-making (Cohen et al. 1972), and later the Multiple Streams Approach (MSA). As Kingdon (2003) observed, the right mix of problems, policies, and politics must align for a window to open for policy action. Ambiguity is a regular feature in policymaking and an attribute of the landscape in public administration. Effective use of symbols can provide a way for enterprising officials to cut through the noise of ambiguity (Zahariadis 2014). Symbols make broad appeals to universality in the public sphere, cutting across wide demographic expanses, even if citizens frequently read into the vagueness of symbols with their own lived experience, filling in gaps where rhetoric is perhaps purposefully unclear. Symbols in public practice, as they exist outside lived experience, can be unifying even if they are, at root, ambiguous (Stone 2012).

White and McSwain, in evaluating semiotics in application to public administration, suggested that semiotics was a "science that studies how the human self is constituted" (1993, p. 28). White and McSwain further observed that "the way that signification constitutes the self creates in the self a desire for narrative" (1993, p. 32). For the purposes of making policy in the public sphere, what matters most is potentially not policy as an outcome or measurement of performance, but rather the creation of self and narrative, and in a wider view, the creation of identity. Because the system is not actually based as much upon closeness of fit between policy and reality or accomplishment in outcomes, but rather on stability and creating the right conditions for operation of markets, the lack of movement may make little difference. The ultimate goal of public administration is to be "the agent by which community is achieved and maintained," even if "there is nothing outside ourselves that we can depend upon" (1993, p. 35). Rather than running from this contemplation, semiotics perhaps encourages the public sphere to embrace it, by finding and exploring the narratives that allow common understanding among groups of dissimilar mindset in the public sphere – not merely allowing for public participation, but actively seeking to include it and act upon it.

Semiotic analysis of law/policy/regulatory content, drawing on the work of Saussure, Peirce, Eco, and others, allows for creation of a model of brand versus product, and of medium compared with message. Work in semiotics often focuses on signs and the making of meaning in particular instances, which lend itself to narratives and sound bites; consistent with the observation of White and McSwain, such evocations often rely upon metaphor to create rich meaning. Lakoff and Johnson claimed that "human thought processes are largely metaphorical" (1980, p. 6), and suggested that "the essence of metaphor is understanding and experiencing one kind of thing in terms of another" (Lakoff and Johnson 1980, p. 5). It is thus the same in public administration. In public contexts, metaphors and other rhetorical devices allow for the creation of broad storylines and identities that are a basis for action as well as a means of identity building.

The public seldom shares a universal perspective, but this does not stop a seeking after the development of common perspectives and useful abstractions. As Geuss stated, "Objectification, false universalization, inappropriate abstraction, and ahistoricism are related deficiencies. People in modern capitalist societies. . .are encouraged . . . to have the wrong conceptual attitude towards their society, an attitude that stultifies their own possibilities of action" (2004, p. 131). The belief may exist that the reality of the present is the only way things can be, so there is little reason to argue. In that most people might like to believe, for example, that "reality can be fully depicted by a set of distinct facts, each separate from the others – to certain standards of clarity of linguistic usage, to the use of formal logic as a basic tool of philosophic analysis, and to the final grounding for all

empirical knowledge in direct perception" (Geuss 2004, p. 132), the trappings of public policy may be widely accepted and embraced. There is nevertheless a "slack" as it were between "language and the concept" (Geuss 2004, p. 134), and though we may all wish to believe we agree on a sweeping vision of truth in policy, most likely we cannot even bring ourselves to agree on a small-t version of truth in defining our terms.

In public administration, the above considerations are particularly salient. Semiotic analysis is relevant to public administration because symbol is a useful tool in cutting through ambiguity in the public sphere – appealing to common elements in the citizenry and, from a positive standpoint, bringing the public back into the public sphere in a more participative manner. The reasons for this are well worn in the literature as part of public administration's legitimacy project, for lack of a better term. Public administration has at times considered its positioning vis-à-vis political structures and the public generally as questioned. Public administration is at once necessary for the operation of government and yet unelected; public administrators at various points act in roles that are virtually, sometimes peculiarly, executive, legislative, and judicial. Administrators receive oversight from all three branches of government in the United States experience, as an example, with international example often showing similar levels of accountability and calls for transparency of the administrative apparatus. There is a constant drumbeat of the need to call administration to account. Administration in turn responds with a broad discourse in service of legitimization. As symbol is often called into service to achieve public ends, and ends more particular but offered nonetheless in the name of the public, it is valid to challenge such invocations of the symbolic not only as symbols in and of themselves, but as intentions and ambitions as part of what are sometimes larger agendas.

## Applications of Semiotic Analysis

In the literature applicable to public administration, analysis of the symbolic in the public sphere has been employed in foundational explorations by Edelman (1964), Goodsell (1977), and Fox and Miller (1996). There have been efforts to analyze communication of official values through stories, for example exploring the National Performance Review as a text through quantitative content and story analyses (Sharp 1998). Symbols may be helpful at communicating values to administrative structures, but the stories themselves may be out-of-phase with expected outcomes. The need for participation in the policy process has been emphasized, as a way of not only being inclusive but allowing for improved decision-making and increased sustainability of the system as a whole. In this view, semiotics is "about exploring ideas with people and carefully considering who is making the argument, what the arguments mean to individuals and interest groups, and why" (McIntyre-Mills et al. 2008, p. 305). An evolving consideration is societal means of communication, with the Internet as a principle mode to "organize intellectual space, to produce, store, and distribute ideas and information" (Strauber 2004, p. 353); this has implications for how citizens perceive law, agencies, and the public sphere generally – possibly shaping citizen understanding and participation profoundly.

Fox and Miller (1996) observed that signs encountered in the policy realm may be non-referential, existing *only as signs* that may point to nothing in particular, a point that echoes Baudrillard (1983); in this respect, the reality of the public sphere may be built on a shaky foundation of symbol, with a tendency toward bureaucratization betraying a false sense of stability. Garrett and Storbeck (2011), in a more recent application of the Baudrillardian simulacra, considered the building of fence along the southern border of the United States, a symbolic move that causes displacement and heterotopia, causing great turmoil to those in the immediate area with considerably less understanding held at a distance. The sign of the barrier between the United States and Mexico, variously framed as a response to a need to quell drug traffic, terrorists, and the flow of illegal immigration, provides a practical example, as it has shifted as a symbol invested with great rhetorical value to suit the political tenor of

the day. As a related point, it is worth considering in semiotic analysis that "highly realistic representations in any medium always involve a point of view. Representations which claim to be real deny the unavoidable difference between map and territory" (Chandler 2002, p. 78).

Other ways of semiotic exploration include the uncovering of usages of political power, especially those where language-games are in play (such as those proposed by Wittgenstein); in such instances, the making of meaning is the reality. Politics makes a story and tells it; in public policy, the manner of telling a policy-related story follows certain conventions and is understood as real independent of its level of consonance with fact. Meaning is attributed to policy through the convention of a game, this is taken as fact by the public generally, and can be discovered through how language is used in the game (Xanthos 2006). The public may expect something more than the playing of language games, but it may be that the extent of the transaction *is* the language game and the making of meaning in that way, rather than the creation of programs to address specific purposes or the anticipation of change in societal outcomes. Such activity not focused on outcomes may be willful or merely neglectful, or simply speak to awareness of a game being played. From a performance management perspective, it may be difficult to connect symbol and belief – communicated as political intent through law – to a resultant program and its outcomes, even though the expectation for this is reasonable. It is therefore necessary to make clear that an outcome is actually expected, and that the intent is not toward some type of policy subterfuge.

Study of semiotics in the public sphere is becoming increasingly relevant, given the use of signs to create meaning in disinformation campaigns on a national and international basis. As with the value and meaning created by skillful marketing in the minds of consumers, those engaged in marketing in the public sphere can deftly market various forms of policy and political product. The engagement of branding and use of signs for a host of purposes in the present context is unmistakable in the public sphere, and is seen across the political spectrum. Taking language from the United States' Countering Information Warfare Act of 2016, there is a need to develop and disseminate "fact-based narratives and analysis to counter propaganda and disinformation" (S.2692(3)(b)(3)). However, what constitutes fact at any point in time becomes increasingly obscured through instances of rapid-fire social media communication (through Twitter, for example) of questionable validity and intent, differing opinions of what might constitute authoritative sources of information, ambiguity in stated purposes and outcomes for the public sector, destructive acts undertaken in the public interest, and the intensifying worry of the so-called "fake news" being taken as genuine. The result of this mix of efforts is the creation of thoughts and feelings in the public that are very real, taken as objective truth and useful to public action, even if the signs and symbols used to evoke these sentiments are often illusory.

## Concluding Thoughts

Language – in administrative procedures, laws, and even flyers for public events – speaks volumes about problem definition, and how public agencies see themselves, their missions, and their client communities. It follows then that how administration chooses to behave in problem definition, program implementation and evaluation, and general administrative activities can tell us much about what is valued when compared with what was intended given a basis in rhetoric. As agencies seek to make meaning, the public observes this meaning-making activity and tries to make sense of the effort and their role in it, even if the role is largely passive. The attempt to make meaning, through symbol for purposes of legitimization or to advance agendas, will either succeed or fail. Even where efforts have apparently succeeded, the use of symbol might fail the public because its success then depends on distraction and a lack of critical thought. This is no substitute for awareness, participation, and genuine consent of the governed. Semiotic analysis encourages a closer look at signs – even those held as sacrosanct – that might otherwise be taken as given, and

active consideration of how those signs may be regarded by others. The goal of such efforts might be a more inclusive, participative, and forthright public sphere.

# Separation of the Powers from Birth to Now: Democratic Countries

Fateme Tavallaei
PNU University, Tehran, Iran

## Synonyms

Executive; Judicial institutions; Legislature; The separation of the powers

## Definition

The separation of the powers refers to the idea that if the legislative and executive powers are united in the same person, or in the same body of magistrates, there can be no liberty, because apprehensions may rise, lest the same monarch or senate should enact tyrannical laws, to execute them in a tyrannical manner.

## Introduction

From east to west and north to south, people with any race, color, religion, and culture always try to

overcome the tyranny and gain democracy and liberty during the history. So it's not amazing to confront the complementary or completely new ideas for the human being social systems. Political theories are one of the originations to meet these kinds of needs. As Princeton (2015) defined, it is the study of the concepts and principles that people use to describe, explain, and evaluate political events and institutions. Any idea in this area has been impacted with both cognitive and environmental conditions. So it's reasonable to see different types of states, governments, and laws with various mechanisms around the world such as parliamentary, presidential, or semi-ones but finally may have similar spirit in its nature. As a citizenship, all people confront the situations to decide on issues which can affect other members of the society. So it is needed to be aware of political systems, how to clarify the power, authority, responsibility, morality, and anything that can be considered in the relation of society members and their governments. Among these types of thoughts, the separation of the powers is one of the strongest theories and also with different models in countries that has grown during the history from Aristotle, John Locke, de Montesquieu, and Jean-Jacques Rousseau to now. In this article, with a brief review of the philosophers' thought about the theory, origination, and definition, the factors had affected on the theory as an input and various models in countries around the world as an output will be introduced. Finally, some necessity of changes according to modern world will be discussed.

## Origination of the Separation of the Powers

According to the bold references, it seems that theory of the separation of the powers was born in the political book by Aristotle, whom had been impacted by Plato. Though believing in deliberative, executive, and judicial powers, he did not delimit them clearly (Enayat 1959, p. 126). So the mechanism he defined was somewhat overlapped. After that, in seventeenth century, John Locke in his book, *Treatise of Government*, again explained the three body of institutions, but with the distinction between legislative and executive ones (Osquian 2009, p. 15), with a little superiority for legislative as the people's power and authority allocated (Khosravi 2016, p. 84), and defined the third institution as federative for governmental interrelations such as war, peace, and making contracts and did not consider judiciary one in his power distribution structure (Ghazi-Zade 2006, p. 163). De Montesquieu in eighteenth century, might be the most important person in forming the theory, stated his political and legal thoughts in *The Spirit of the Laws* book. He tried to define the way of gaining political freedom by best synthesizing the suitable institutions. Distinction of institutions, balanced government, distribution of powers, and considering the law are his tools in this way (Khosravi 2016, p. 85). His distinct institutions were legislative for legislating or modifying the laws, executive for international legal and external security, and judicial for judging, punishing, or resolving the fights (Montesquieu 1955, pp. 294–295). Actually he mentioned the balance of the powers more than absolute distinction and being responsive with law orientation (Alikhani 1995, p. 135), but the absolute distinction interpretation led to presidential systems in countries such as the United States. After that, Jean-Jacques Rousseau in eighteenth century was another politician with important role in the theory of the separation of the powers. In his book, *The Social Contract*, he defined the best governmental system as democracy ones, which can be created by social contracts and then political community. The power in his theory belongs to people which is illustrated in legislative institution. He believed in cooperation between executive and legislative powers which led to parliamentary regimes (Shakibapour 1967, p. 21).

## Charles-Louis De Secondat, Baron De La Brede et De Montesquieu

As explained in the previous part, the separation of the powers is shaped during the history. One of the politicians with huge role about this theory was Charles-Louis de Secondat, Baron de La

Brède et de Montesquieu. He was born in 1689, in Château La Brède, near Bordeaux in France and died in 1755 in Paris (Clarendon Press 1961). He was from a noble ancestry. Lost his mother in childhood, studying at the catholic College of Juilly, being the counselor and then the deputy president of the Bordeaux Parliament (George Routledge 1887, p. 10), with passions such as Roman law, history, biology, geography, and physics, and travelling around the countries made him a sharp social commentator and political thinker who gained the respect of his fellow philosophers with his masterwork *The Spirit of the Laws*. Other principle works of de Montesquieu are as follows: memoirs and discourses about echoes, renal glands, weight of bodies, transparency of bodies and natural history, *Spicilège*, *System of Ideas*, *Persian Letters*, *The Temple of Gnidos*, *True History*, *Considerations on the Causes of the Greatness of the Romans and their Decline*, *Arsace et Isménie*, *A Defence of The Spirit of Laws*, *An Essay on Taste*, *My Thoughts*, and *De l'esprit des lois* which is one of the great works in the history of political theory and in the history of jurisprudence (Clarendon Press 1961).

## The Spirit of the Laws

*The Spirit of the Laws* book was written by de Montesquieu in 1748. It is divided into 31 chapters started with defining the natural laws as steady and governmental ones impacted by social spirit. He mentioned the harmony of the governmental doctrines with civility and legislated laws and even the proportion of laws with each other. The relations among laws and governments, freedom and security, and at last the continent, religion, and trade in a country are other elements that he mentioned in his book. He categorized the governments into three groups: the republic based on virtue, the monarchy based on honor, and despotism based on fear. According to his opinion, security and peace is the ideal of one government which can be gained through balanced systems (Mohandes 1995, p. 295). It is where de Montesquieu described the separation of the powers to gain the balanced system and a tool to obtain the freedom. De Montesquieu had a multidimensional perspective to the political issues and consider many aspects in forming the governmental structure, so his idea is still alive and used all over the world.

## The Separation of the Powers

As mentioned in previous sections, de Montesquieu gave the classic exposition of the idea of the separation of the powers. In his book, *The Spirit of the Laws*, when it comes to the 11th chapter, de Montesquieu stated the three parts of government bodies and the necessity of their separation. His power division consists of three branches named legislation, executive, and judiciary. The first is for legislating or modifying the law, the second is for international law such as providing security, war, and peace with other nations, and the third is for judging, punishing, or resolving the fights. He argued that a union power for varied functions of government would lead to overgrowth a particular organ and misuse of the power and then would be danger for political liberty. "When the legislative and executive power are united in the same person, or in the same body of magistrates, there can be no liberty; because apprehensions may rise, lest the same monarch or senate should enact tyrannical laws, to execute them in a tyrannical manner" (Mohandes 1995, p. 300).

In a whole view, the separation of the powers came to distribute the powers in a balanced way. Accountability, transparency, check and balances, and preventing the concentration of the powers are the impact of this theory. Cameron (2013, p. 12) states that the separation of powers contributes to political order both positively and negatively: positively for the violations which may also hamper deliberate improvements and adaptive strategies within a fixed flexible and evolving legal political order and negatively for the subtle and ostensibly reasonable violations

which may open the door to arbitrary physical violence and abuse.

Though, it had been not yet made in those historical age, later the interpretation from the theory was divided into two groups: horizontal separation without coordination among institutions which led to presidential systems and vertical separation with coordination which led to parliamentary systems (Ghazi-Zade 2006, p. 168). Though there are countries in this spectrum of distributing powers, it seems that the complete division is not possible and the overlap can be seen among institutions.

## Social and Cognitional Elements as an Input

By reviewing de Montesquieu lifelong thought and ideas, his books especially *The Spirit of the Laws*, and comparing them with the previous philosophers, it can be concluded that the social and cognitional factors considered in the theory made it applicable around the various countries with different cultural and political thinking all over the world. As Cameron (2013, p. 12) states, by considering the human subjects as a thinking agent, the cognitive theory provides a metatheory that leads to understanding of how people have theorized about constitutional order and how these theories have become part of the material context in which political systems emerge and evolve. In this way, by considering the conditions such as time and space, it is possible to eschew the monopoly and static and Eurocentric quality of diverse political interpretation of the theory. Language, literacy, and media are the factors which can be effective for human collective actions. Periods of productivity, regional patterns, and attitudes are other factors that are mentioned.

Cameron (2013, p. 52) also added the social and cognitional elements which impact the separation of the powers during the history: emergence of societies rooted in Greco-Roman era, Gutenberg Revolution for the rise of legislatures and the creation of a public sphere of opinion, and emergence of mass politics and the electronic era. In each of these periods, changes in social organization and communication resulted in new ways of thinking about constitutions.

So due to differences of social and cognitional experiences of the communities, it is reasonable to see different mechanisms of the separation of the powers around the countries all over the world.

## Various Governmental Systems as an Output

Due to the classical divisions of his predecessors into monarchy, aristocracy, and democracy, de Montesquieu produced his own analysis and assigned to each form of government an animating principle: the republic, based on virtue; the monarchy, based on honor; and despotism, based on fear. His definitions show that this classification rests not on the location of political power but on the government's manner of conducting policy; it involves a historical and not a narrow descriptive approach (Clarendon Press 1961).

On the other side, based on the degree of cooperation among institutions, there can be presidential and parliamentary political systems or semi-ones. In more details, Lijphart (1992, pp. 2–3; 1999, p. 17) states that in a presidential system, the president is elected popularly for a fixed time and also is the head of the government and non-collegial executive branch but in parliamentary system, the prime minister is selected by the legislature and can be removed by them and the executive branch is collective or collegial.

From the third perspective, based on the centralization of the governments, the federal and unitary states appear. Hanf and Toonen (2012, p. 2) define the unitary system of government as a single center of authority that exercises the ultimate prerogatives of governments and federal systems in which the authority is divided between a national government and its regions such as states, provinces, cantons, or lander.

So under the umbrella of de Montesquieu definitions, countries are categorized in this way: republic ones such as Russia which is semi-presidential and federal (The constitution of Russian federation 2007) or France which is semi-presidential and united (Central Intelligence Agency 2016) and monarchy like Australia which is parliamentary and federal (Australian Geographic 2001) or Japan which is parliamentary and united (The National Diet of Japan 2016). There are yet countries which do not follow the separation of powers like Oman which is completely monarchy.

## Emerging Powers in Modern Era

As said above, the separation of the powers has grown during the history, and due to its embedded socio-cognition nature, it is still alive and can be used all over the world. It is not a static theory and considers the social and cognitional factors. As condition changes, it can be expected the different behaviors of institutions. So being aware of new powers and challenges can lead to better governmental mechanisms.

Besides the political, social, economic, and other challenges which are mentioned in the article, cutting-edge technologies are those with the huge impact on all human life aspects and enable them by the spread of information, authority, and freedom.

Milner (2006) states that political area is not far from this issue and has an important role to promoting opportunities or slowing down the technology use for citizens due to its democratic or autocratic nature.

Besides the previous powers, the changes and emerging powers from technology and information lead to authority and a means of control, and by its new social and political interaction, old mechanisms among institutions would change.

This evolution has brought new definitions to political area to better define the innovations and changes. For example, in the case of democracy (Kirn 2000), the ideal point of political issues, we confront to netocracy with its own specific features. Netocracy devoted to this type of power, and as Bard and Söderqvist (2012) define, it denotes a new dominant class of the information age, one that has the power to dominate, control, and exploit information and communication networks through netocrats (members of this class).

In today's world with emerging interdisciplinary issues and also the power of tools to blur the boundaries and diminish the limitations, it would be expected to confront new mechanisms and evolution of governmental systems. The separation of the powers also confront to new challenges and needs to be updated according to new changes.

## Conclusion

The article was about one of the political theories, the separation of the powers. The theory has grown during the history, and in each part of the period, social and cognitional elements affected the mechanism of its application. In the article, first by reviewing the great philosophers' thought and idea about the theory, we concentrated on de Montesquieu idea in his book *The Spirit of the Laws*. His book includes chapters about natural and legislated laws and illustrated the steadiness and various laws due to social nature. By introducing the triple institutions, legislation, executive, and judiciary ones with their own tasks and distinction among them, he stated that the powers should be distributed, so the democracy would be opened to human societies. Though he did not mentioned the complete distinction among institutions and pay attention more to the balances of institutions, the interpretation of his idea led to presidential systems in the United States. After that, Jean-Jacques Rousseau stated the cooperation of institutions which led to parliamentary systems. Today, these kind of governments try to have the best and suitable interaction to obtain the balanced among institutions' powers. Social and cognitional factors, besides the new evolution of the era such as cutting-edge technologies, are other issues which are mentioned in the article. By considering the natural laws and social nature impact on the theory, Montesquieu wisely

prepared a governmental structure basement that can be promoted according to onward evolutions.

# Serial Entrepreneur, The

David Wiener
CEO – David Wiener Ventures, Park City, UT, USA

## Synonyms

Artist; Creator; Designer; Engineer; Entrepreneur; Inventor; Maker; Risk-taker

## Definitions

Entrepreneur: a person who organizes and operates a business or businesses, taking on greater than normal financial and other types of risks in order to do so.

An **entrepreneur** is an individual who creates a new business, bearing most of the risks and enjoying most of the rewards. The entrepreneur is commonly seen as an innovator, a source of new ideas, goods, services, and business/or procedures.

An **entrepreneur** identifies a need that no existing businesses address or improve upon an existing idea and determines a solution for that need. Entrepreneurial activity includes developing, launching, and marketing new businesses, often with the end goal of selling the business to turn a profit.

A **serial entrepreneur** starts several businesses one after another or runs several concurrently rather than beginning one venture and staying focused on it for many years like a more typical entrepreneur. Some extraordinarily successful businesspeople such as Richard Branson, Elon Musk, and Laurel Touby are serial entrepreneurs.

## Introduction

Entrepreneurship is dangerous. It's bad for your health, well-being, and the well-being of those close to you. Anyone interested in starting and running their own business should consider

which entrepreneurial model they prefer – **small business**, scalable **startup**, large company, or **social entrepreneurship**.

It's also one of the most exciting and exhilarating careers anyone can imagine. Done well, it can provide an endless source of "projects" and businesses to fill your days until you are dust. Done poorly, you risk losing everything – your bank account, your home, your family, your life. And what could be better than that is a career that has you riding the razor's edge on an almost daily basis.

If this sounds dramatic or melodramatic, it's not. Reality counts for a lot in the world of entrepreneurship. Colleges and universities can provide all kinds of theory and experimental exercises – even internships – but none of this fully prepares one for the wide-ranging challenges that come at you like asteroids, sometimes in an unrelenting stream.

One doesn't set out to become a serial entrepreneur. In fact, until the last few decades, the term "entrepreneur" wasn't as commonly used as it is today. People *just did it.* They had an idea. They bounced it around and let it marinate in their heads and stomachs until one day when they pulled the trigger and set out to commercialize their brainstorm.

The idea of being a *serial entrepreneur* is more a result of history – the history one creates over time, realizing the moniker only *after* doing it.

A passage I like to reference when discussing the makeup of a serial entrepreneur comes from Francois Auguste Rene Chateaubriand (1768–1848):

> A master in the art of living draws no sharp distinction between his work and his play; his labor and his leisure; his mind and his body; his education and his recreation. He hardly knows which is which. He simply pursues his vision of excellence through whatever he is doing, and leaves others to determine whether he is working or playing. To himself, he always appears to be doing both.

Working or playing, if you follow your passions and find ways to turn them into business, then you may be able to turn entrepreneurship into serial entrepreneurship.

## A Little History: The Emerging Entrepreneurial Mind

My own story starts when I was 3 or 4 years old, playing with plastic tools and graduating a few years later to real tools – hammers, saws, screwdrivers, hand drills. I wasn't trying to be an entrepreneur (I certainly didn't even know the word). I was simply following an interest, which became a passion. At that young age, I was fully intrigued by tools and their related hardware: nails or all shapes and sizes, straight or Phillips head screws, assorted wires, woods, and then plastics, followed by metals and beyond. A trip to the local hardware store was better than going to FAO Schwarz (New York City's then greatest toy store in the world). I was mesmerized by carpenters' cars, typically old beat-up station wagons that were filled with open top wooden toolboxes and open compartments full of every kind of hardware one could possibly need to build a house. To me, they were the luckiest guys on the planet – driving around with a sea of tools – what could be a better life?

I graduated to power tools before I was 10. I also started putting them to use making things that I thought others might like as much as I did. My father, an artist, taught me to cut glass and lead solder. So, I figured it was only natural to make stained-glass peace medallions (this was the late 1960s after all). I sold these to kids in the neighborhood.

I can't recall what my price was, but my cost of goods was certainly zero, having scoured the trash bins of my father's studio. I also can't recall thinking about *business*, *profit*, *and loss*, but I did think about production. I quickly realized I could speed my output by processing the materials in small batches (very small), performing a sort of product-line approach to building inventory (another word I didn't know).

The excitement of selling, receiving dollar bills, and seeing people (kids) react to my work was all very heady stuff. The dollars in particular caused me to realize the benefit of work. I could make money and use it to buy meaningless junk that was hugely desirable to me. About this time,

I saw ads in comic books promoting the opportunity for kids to earn and win prizes for selling greeting cards and garden seed packets door-to-door. I was all in. I filled out the coupons and sent them in (or my mother did as I had little understanding of mailing things).

Selling to homeowners (a nice way of saying accommodating next-door neighbors) was an eye-opening experience, especially as a little kid. I'd get invited inside and I'd lay out the samples that the greeting card or the seed company sent. I was determined and I knew what "prize" I wanted with my sales levels.

Sometime later, I started my first *real* business, an underwater boat cleaning company to wipe and scrub the hulls of racing sailboats at our yacht club. I'd spend hours underwater with sponge, brush, and endless slime, ultimately freezing myself in the dark Long Island Sound water. Aside from getting small checks from boat-owners, the most exciting part of the job was racing to the showers in the club's bathroom where I'd stay until the manager poked his head in and screamed about wasting water. But at 13 or 14, I could handle the screaming in the interest of thawing out.

The boat cleaning led to my first mature initiative – I invested in my business by purchasing a much-needed wet suit. This was back in the days of Jacques Cousteau and the two-piece US Divers standard black waffle suit that wreaked of rubber. But it allowed me to spend more time underwater, which felt good and helped me pull in more dollars. It made me really ponder the concept of "it takes money to make money."

Later, my interest in boat racing and photography gelled and I became one of the youngest professional photographers ever to cover the America's Cup, US Open tennis, the Indy 500, and World Cup skiing. I was still in high school and earning bigger dollars from magazines and through the agency representing me. Again, the flow of cash was intriguing, though my brain was constantly thinking about what next piece of camera gear I could buy rather than how I might save it for something else. The reality was that I was "investing" in my future by getting the gear I needed to be a more effective photographer.

All the while, I was a car racing fanatic (it started at age 5), and my mix of inner drive coupled with a love of style got me thinking that I could buy a car – and not just any car. I wanted a Porsche. Of course, I did. I was brainwashed. Of course, I couldn't afford any Porsche, my father wasn't going to spring even a dollar toward my dream, and I had zero knowledge about car mechanics. But that didn't stop me (this is where some early signs of what was to become my character would emerge). I worked at photography, took on a dishwashing job, hired on to do yardwork in town, and even did housecleaning, shopping, and more for the pregnant wife of a family friend. I would do anything it took to earn money for *my car*. Again, the beginnings of an entrepreneurial spirit were surfacing. I deposited every cent (literally) in the bank, hoping to earn interest, and then one day, after a lot of hunting, I found the one Porsche that might actually fit my paltry budget of $1,800.

The car was a beat-up mess with an engine that didn't work, paint that needed a total redo, and an interior that just wouldn't do. This is where another characteristic of the entrepreneur emerged. I figured I could learn as I went. I bought the car, got it home, purchased a Porsche car repair manual, and began taking the car apart, starting with removing the engine – a gargantuan task to a novice. But I did it. I told myself I could. I got down and dirty and made it happen and shocked my dad along the way. His only comment was: "Well, as soon at that thing's working, you can sell it, cuz kids don't need cars."

I dropped my idea of going off to college to study photography – I was getting offers from Sports Illustrated, so why study it? More importantly, I realized I was more interested in making things than taking photos of them, so I got myself accepted into the engineering department at the University of Vermont and went on to study mechanical engineering, aerodynamics, and art (thanks to a transfer to Hampshire College where I could "design" my own major).

After college, I was recruited by the most famous engineer in America at the time, Paul MacCready of human-powered and solar-powered flight fame, among other massive achievements (National Aviation Hall of Fame n.d.). It was interesting for a bit, but my real desire was to create and do it on my own terms, a common trait in the entrepreneurial mind. I left at the end of a vehicle design project and went back to Connecticut to begin my real career of working for myself. It was a bold and risky move, and I was fully committed to making a reality.

I rented a house, turned the basement and extra bedrooms into workshops, and started experimenting with a variety of ideas in furniture, lighting, audio, and car design.

All this history isn't meant as a walk down memory lane. It's to give you a sense of how lots of seemingly disparate events and interests can be analyzed using 20/20 hindsight to see that becoming not just an entrepreneur but a serial entrepreneur can happen. It's also meant to give a glimpse into some of the characteristics that are so crucial to a life of entrepreneurship.

## Common Traits of Serial Entrepreneurs

A quick search of the internet and you will find numerous sites and articles espousing the "traits" needed to be a successful serial entrepreneur. I found the following: **The Six Common Traits of Serial Entrepreneurs** – Good Time Management, Ability to Set Concrete Goals, Strong Discipline, Unwavering Optimism, Creativity and Innovation, and Strong and Stable Leadership (Alton 2016).

In order to properly explain what it means to be a serial entrepreneur, one must first throw out the idea that there are any "common" traits other than a high level of risk tolerance and a bullet-proof nature. All the academic claims of traits are meant to give you an idea of what a perfect specimen might exhibit, like building a robot or replicant to do everything right. It sounds good in the movies, but reality suggests that loads of successful entrepreneurs – and serial entrepreneurs – lack a variety of traits but make up for them with raw enthusiasm, drive, and determination.

As an example, time management is clearly a wonderful skill to possess. Naturally, managing time is important, but the idea that one has to be good at it has little to do with being a serial entrepreneur. In fact, the idea of being highly creative, inventive, and driven often runs headfirst into any semblance of time management. Take me for example. I believe my time management skills stink. Even though I've managed my own time, and that of hundreds of employees and consultants over the years, with good results along the way, the actual management and, more critically, the efficiency of my activities have been terrible. For one thing, I always bite off more than I can chew. I wake up almost every day in the dark excited about all the things I am going to achieve that day, only to end my day having maybe dealt with one or two things on my list. And like the definition of crazy, I keep doing it, expecting a different result.

The problem with time management is that the outside world has no concern about *your* time, schedule, or goals. While I never set out to be an entrepreneur – and certainly didn't study anything resembling business – I have collected thoughts and ideas over the years about the realities of business, and of being an entrepreneur. One of the things I tell people on a pretty regular basis is, "Being the leader, founder or CEO of an enterprise means your days are filled with fending off the asteroids hurtling at you all day long. It's hard for the leader or CEO to get critical things done thanks to the firefight that day-to-day business brings as one is trying to create, build, market, sell, distribute, and ship something."

The point here is that while one must pay close attention to priorities and deadlines, one must also develop a sort of *business-ninja* style of operating. Learning to fend off, delegate, and, most importantly, make fast – and good – decisions is far more critical than checking off a box that tells you you can be a serial entrepreneur.

Setting concrete goals is another of the Hallmark Card school of entrepreneurship claimed traits one needs to possess. Again, this is a great *goal* to strive for, but again, reality suggests

(at least in my world) that concrete goals are anything but. I love the idea of concrete goals and hard deadlines and other *hopeful* elements of doing business, but I don't think I've ever had a goal that didn't change substantially over the course of inventing a new product or business. Naturally, there are going to be lots of stories of people who set a goal and went out and achieved it. The issue isn't whether one can achieve the ultimate goal (design the greatest _____ ever, sell to _____ countries, make _____ dollars, etc.). The issue is: how do you deal with all the obstacles that exist, or will present themselves, in your quest for the ultimate goal?

Do not be discouraged. These reality checks are going to help you. You will save time, money, heartache – and maybe your life. Being realistic is the single most critical thing a serial entrepreneur *should* be. Unfortunately, dreamers are rarely all that realistic. The dreams change, evolve, grow, and, sometimes, explode, like when you realize "your" brilliant idea was also the brainchild of many previously unknown competitors. But do not despair. You are going in with eyes wide open.

And while I'm at it, I will help you dismiss the ideas of *strong discipline* and *strong and stable leadership.* After all, most individuals don't exhibit either of these traits, certainly not in the arena of business, and perhaps not anywhere. In fact, all one has to do is note all the weight-loss, stop-smoking, buy-this-exercise program or call this ambulance-chasing law firm, to realize that the masses were not engineered for discipline. We didn't get real-world lessons in discipline in school other than that of handing in papers on time (hopefully). So, the odds of bringing strong discipline to entrepreneurship are against you. And doing it on an ongoing basis – serial entrepreneurship – isn't necessarily going to be in your favor, just because you've *done it before.*

If discipline is a long shot, how can leadership be possible. Of course, it is possible, and it does improve and evolve as one creates multiple business ventures and deals with a growing series of personnel and others, but leadership is such a varied talent that one person's idea of leadership can be the polar opposite of another's. Then there's the issue of leadership relative to a given project, program, industry, or market. Leading people can only evolve with experience. It's a critical skill but it's hardly a common trait, in my humble opinion. I've witnessed too many lousy leaders of businesses that have achieved very nice success. I am sure that you have too. Consider the opposing approaches of the military-type leader with little room for criticism, input, or flexibility to that of the current culture "make-everyone-feel-good"-type leader, who can't make a decision without a long meeting, endless emails, and opinions. They can both be successful but are they good leaders?

My company was hired to rebrand the US Ski Team back around 1998 when they had a precision-oriented person running operations. While he felt he was doing the perfect job in *telling* everyone what to do, as an outsider, I was able to exercise my ideas and directives much more freely than anyone employed in the organization. It became a battle of wills, and it burned into me the issues and impact that various styles of leadership created within a business.

As I hired more and more personnel during this period, I learned some interesting concepts about discipline and leadership. I realized I had been bad at delegating, due to my endless search for perfection, whether in engineering, manufacturing, marketing, branding, customer service, and *all* the other areas of the business.

Speaking of traits and reality, there is only one and only one common trait: one common reality. It is the ability to embrace and endure risk. Period. Just like discipline and the others listed above, risk tolerance is not part of most people's normal makeup. Most people think risk is asking someone out on a first date or buying an unusual outfit or, at a bigger level, buying a car or a home. The idea of pouring one's lifesavings and unpaid time into a dream is not how most are normally wired.

Long into my career – the one that turned out to be serial entrepreneurship – I was still forced to deal with risk on a regular basis. You might think that as one does it more and more, one can reduce risk. The reality is that every venture is (or likely is) different and therefore creates new things to learn, new resources required, new personnel, new facilities, and so on.

I was deep into a major partnership with Ferrari in Italy, and we were manufacturing a statement product that required a new office and shop, huge machinery investments, as well as a whole new crew of people. And then I got convinced (or convinced myself) that buying another company would enhance all we were doing. Without endless detail, it became obvious that we needed a serious cash injection. So, what does the high-risk-loving serial entrepreneur do? He bets on himself and mortgages the house. Seriously. The house that I lived in, along with my wife and three boys. In other words, I was putting the security and safety of our living space in a priority position over my family. Of course, I didn't see it that way at the time. *I'm an entrepreneur. I can't fail!* These are the sometimes-fatal words to be very aware of when they cross the transom of your mouth.

That mortgage and the ensuing stress did nothing to make marriage better. I could just motor along in my entrepreneurial dream sequence, knowing everything would work out, while my wife stressed and complained and worse. Thankfully, my bet paid off, the bank was paid off, and my wife got a beautiful new car as a kind of peace offering. But, to this day, she doesn't let me live that one down, or many of the other stress-raisers I've created over the years.

I also mentioned being bullet-proof. If you want to create, invent, market, and sell, you had better learn to take punches. I am not talking about social media reviews, "dislikes" or negative tweets. I am talking about deflecting the constant arrows flung by employees, resellers, customers, family, and friends, as you strive to create that great, innovative *thing*. Coming home after a very long day of work, only to be leveled by comments or interrogations about the day's activities, past personnel issues, bills, chores, etc., can be demoralizing and sap you of your excitement and drive to achieve those goals I have already addressed. Worse, when the bank calls or the wire doesn't go through or the promised payment never materializes while you are balancing the ins and outs of your bank account, you'd better be able to take it and make good decisions – quickly. How many times have I said something I regretted, or more to the point, something I only thought of saying after it was too late? Lots. Being fast on your feet and mentally agile is critical to being bullet-proof.

As I look at the realities of entrepreneurship, and the longer-term *serial entrepreneurship*, it's important to be realistic about the concept of *being* an entrepreneur. People toss the term *entrepreneur* around lightly.

## Not Invented Here (NIH)

Serial entrepreneurs are going to run into this more than anyone – not that there's much one can do about it. If you are going to be inventive – and even more so if you are innovative – you will run into *Not Invented Here* (NIH) a lot. It's not so bad if you make and sell your own creations, but if you want to sell or license technology or product designs, the targets you go after will surely be populated with personnel (read engineers mostly) who poo-poo or write off your work simply because they didn't think of it first. It's the Olympics of ego in the world of business. Too bad. Vision, real vision, is in short supply, while there's always an overabundance of ego. . .plenty to go around!

This leads to a discussion of innovation – real innovation vs. *marketing hyperbole* disguised as innovation.

## Are You An Entrepreneur? A Serial Entrepreneur?

The term, *entrepreneur*, is thrown around more and more as colleges and universities grow their course offerings to include entrepreneurship, while online marketplaces allow even individuals with almost zero resources or any tangible offering to promote and sell products, services, music, movies, and more, even going so far as allowing them to collect funds before ever shipping anything. And sometimes the *ever* becomes *never*.

There's absolutely nothing wrong with these students or would-be "manufacturers" calling themselves entrepreneurs; after all, it's just a word, a name, a term. As I often say, even the

guy selling hot dogs on the corner in New York City is an entrepreneur (if you take the most basic definition and use it liberally). By the way, I am a hot dog fanatic and I've respected these people, and the service they provide, since I was about 10. They spend money to create a "business" and they work long, hard hours, sometimes for little financial reward. But like me, I bet they do get rewarded every time a customer breaks out in a big smile thanks to one of their *products.*

Again, it doesn't matter what you call them or yourself. What matters is the attitude and character behind the effort. In the case of a serial entrepreneur, it's pretty clear what their character is and what their ongoing behavior patterns will be.

I am a perfect test dummy for the serial entrepreneur litmus test: I will *never* retire. I am full of dreams, ideas, and energy. Of course, lots of people have loads of dreams. And maybe they also have the energy. But the real test for the dummy is whether it will take the challenge, embrace the risk, and do whatever is needed to realize the dream.

Think about all the people you run into (or maybe it's you) who make statements like: "I've got a million-dollar idea" or "I thought of that idea long before Company X brought it to market." My response, as a test dummy is this: So why didn't you do it? Why didn't you bring it to market if it was such a brilliant idea?

The answer is simple: Ideas are worth a dime a dozen. I hated this notion as a young inventor. My father would trot it out anytime he wanted to put me in my place. But the sad reality is that he was right. The *idea* is the easy part. It's what you do with the idea that's hard, sometimes impossible, and always risky (unless you have an endless bank account or a rich uncle who likes you).

Ask any entrepreneur, or business founder, what the time and cost was to turn their *idea* into a functioning operation. Likely, you will be shocked, and they will likely admit that it took a lot longer and cost a lot more than they ever expected. That's typical. Of course, there are exceptions to this, but they are few and far between, and if you count on being an exception, you may be in for a very scary ride.

Imagine the serial entrepreneur who is constantly creating new ventures, putting together elaborate business plans and projections, and using these to raise capital in order to realize the dream. Now imagine how it feels if you fail, if your projections never come close, if your product doesn't work, or worse, that your product isn't as good as the competition's. Can you live with that? Will you sleep well knowing friends, family, and others have given you money under the cloak of trust and belief? Sounds pretty bad, right? Now imagine doing it more than once.

Any college entrepreneurship program has to tell you the odds are against you. It's a fact. Some say only 10% of new businesses succeed. I bet it's a lot less than that. So how are you going to make it work and then make it work again? And again?

The good news is that while the serial entrepreneur is battling through the minefields of *research and development* and running the business, he or she is learning, gaining valuable *experience.* It's this experience that helps each successive venture gain a bit better advantage, increase the chances of success, and attract others, whether for money, labor, production, or sales. People tend to appreciate the drive and grit that a serial entrepreneur brings to the table.

## Performance and Style

My entire career has been framed by two words: *performance* and *style.* I figured out long ago that I wanted to create things that would wow people. The only way to do this is to make things that provide better performance and/or great style. Think about how these words apply to almost everything in life – and certainly in business. It starts with *your* performance. How do you approach a task or challenge? How do you deal with people? How do you manage your projects? And how much style do you sprinkle on each? As you evaluate your own *innovations*, think about how they are perceived by others, or as an early mentor of mine used to say, the people voting with dollars. It's easy to fall in love with your own ideas, your dreams, your ambition. But are you really able to judge each objectively? That's

where the *experience* I mentioned can help a lot, if you are honest with yourself. Everything we do, and everything we create, every marketing and sales effort, and every business management moment can be evaluated on its performance and style.

Early in my career, I decided that it was a good idea to manufacture recumbent bikes. This was sparked by all the people who would see the exotic bikes I made as part of my college thesis and proclaim: "Where can I buy one? You should make sell these."

There were dozens of lessons to be learned from this venture, but for now, I will confine them to the performance and style elephant that rose its head while I was deep in. Another mentor, one from the industrial design world and a former Ferrari racing team member, advised me to seek the assistance of an accredited engineering firm to ensure my welded structures were absolutely safe. Unfortunately, the firm I hired changed everything about the production recumbent until it weighed too much, had ugly bits all over it, cost a fortune to make. It was just plain slow.

After many worried nights and weeks pondering how to resolve the impending nightmare of a failed product, I took the project away from them and retooled the entire design myself, using common sense, engineering knowledge, and a sense of style. The result was a far more effective vehicle, though it still suffered from one of the serial entrepreneur's worst enemies: *being ahead of its time.* I will address that curse later.

While the engineering was under way, I also had to deal with the image and marketing of the *LandSpeeder*® though I didn't really have much image or marketing experience at the time. What I did have was a conviction to the idea that product design requires good graphic design and a company should have a smart *image.* So, naturally, I was frustrated by the efforts of third-party services. I realized I needed to get educated and learn how to design and produce my own logos, sales sheets, advertisements, photos, and packaging. Thankfully, this was before the internet, so I didn't have to learn that trick!

I hadn't gone onto the bike manufacturing world thinking about image, style, or even ultimate performance. I knew I'd merge all of them as I worked away, but again, I didn't realize the bigger impact of this effort at the time.

In the following years, I started talking about *integrated* programs; the idea was that farming out various aspects of a given venture to a number of consultants or low-cost services would result in a disjointed overall "package" and "story." I figured the person or people who created the original innovation would be best suited to tell the story and put together a coherent package. From product to logo to packaging to sales pitch, the story – and style – had to make sense. Some might say this comes down to the "control" part of entrepreneurship. Perhaps, but I have known other entrepreneurs who have no problem outsourcing this part of the process.

I think the idea gelled for me when I was creating a major fashion line for a luxury brand in Turkey. I had designed all the clothing – all with performance and style in mind – and they then hired an outsider to brand the line. Naturally, when I saw the proposed name and logo, I rebelled and explained how it made no sense given the theme of the clothing. They listened and learned, and I ended up naming the line, creating the logos, all the fine detailing of the garments and accessories. I think my client realized the idea of an *integrated program* at the same time that I did. They went so far as to have me design the store interiors, direct the photo shoots, and source all the furnishings.

## Ahead of Its Time

Entrepreneurs are defined by their unique ideas, their innovations. While developing a dream into a business is a wonderfully romantic idea, and one that can be highly rewarding, the problem with being a serial entrepreneur is that you are innovating on a regular basis, which means you are creating things or services that most people don't realize they need or want.

Surely, some serial entrepreneurs are focused on creating businesses *without* innovating; they simply create a needed service or a solution to a problem that requires a product. But for the

seriously inventive serial entrepreneur, the curse of multiple ideas ahead of their time can be demoralizing over time. On the other hand, having a series of advanced ideas can also be inspiring and energizing, helping to carry you through the rough patches.

My career is littered with products and technologies that people didn't realize they needed. Luckily, some made it through the early stages and difficult sales pitches until people woke up to the benefits of whatever I was selling. I invented audio speakers in a flexible hose. That was an extremely hard sell. But today, the evolution of my earliest SoundTube® designs is in every Starbucks, GAP, Old Navy, and many other commercial venues. The LandSpeeder bike was less fortunate. In 1985, people said they loved it, but those voting with real dollars were pretty hard to find. We made and sold a lot but not enough to claim financial wonder.

In 2015, I embarked on developing a music app that would apply the recording industry's best processing technology to the digital music people were downloading at alarming rates. Those digital files were, and are, so devoid of quality data that much of the detail, whether voice or instrument, is lost. My Aphex Xciter® app took a long time and a lot of money to create, but the result was startling. Major musicians loved it. We did thousands of listening demos. It was a hit with everyone who tried it. But the world had morphed into a music-listening population more interested in how many songs they had in their device rather than the quality of the sound of that music. It wasn't that our app cost a lot; it didn't. But people had become immune to lousy sound and just couldn't be bothered. They could download endless silly apps and games, but hearing the detail that their favorite artists were putting into their music just wasn't a priority. And now, as I write this chapter entry, the 7Tunnels® quantum-ready encryption technology we have created over the past 5 years is yet another fully realized venture that is ahead of its time, even though it isn't. Like the audio app, more secure data encryption has trouble turning heads as most people seem to wave off the threat of hacks and data breaches, even in this age of cybercrime, major corporate and government hacks and endless online scams and spam.

Maybe the phrase "ahead of its time" needs to be revised to "too good for daily use." But the serial entrepreneur soldiers on, continuing to push the story, and, in the parlance of today's business world, *pivots* as needed to keep the idea or venture afloat as long as possible.

As for my story, we ended up selling the audio technology to a visionary leader of a company in the microphone business, and we are in discussions with several organizations that understand the critical importance of protecting data communications in commercial, military, and consumer applications. As usual, I am not worried. . .

## More on Innovation

Speaking on a panel at a cybersecurity event, I was told to prepare to discuss the concept of innovation and innovating in the commercial cyber world. I have often talked about innovation and the fact that it's often just a slick marketing term. The effort of putting pen to paper to solidify my thoughts on innovation made me realize that it's really hard to innovate, and even harder to be an innovator and entrepreneur at the same time. And this led me to consider how to evaluate innovations and opportunities based on *typical* commercial operations.

When I say typical, I mean the trappings of a normal business, and worse, the trappings of a big business. When the serial entrepreneur walks into a typical business, hoping to sell an innovation, there will be the *NIH* issues I mentioned earlier. At the same time, it's important to realize a sad fact of business: many big, successful companies often don't have an innovation culture. What they have is a product or line, or service, that makes them a lot of money, and the upper management drives the employees to ensure that their golden goose keeps laying eggs. In other words, if you approach a company that sells digital printers, you are likely to find them singularly focused on developing iterations of their latest printer, keeping the

innovation in a jar while incrementally advancing their own technologies or designs. They are unlikely to want to hear about your great new method for networking their printers.

It is usually the same for personnel inside these companies. The product people will love to say they have great new innovations when they get to that year's product launch, but the reality is they just want to keep things flowing and not rock the boat.

In the interest of analyzing the efforts of innovating, below are the questions and prompts I devised for the cyber conference. As a side note, the panel I was on had some very impressive people from well-known tech companies. Interestingly, the conversation tended more toward self-promo and rabbit-hole diatribes of things that had little to do with innovation, or more to the point of the panel, how to spur innovation. Unfortunately, there's no way to control a panel once it breaks from the barn. . .

## Framework Questions on Innovation

- Who decides which ideas to chase? And how? Is it based on merit? Ego? Ownership? Hostage situation (your best engineers push their ideas over all else, and you feel the threat that they will leave if you don't cater to them).
- Are you really comfortable with risk-taking behavior?
- Do you have the stomach for true innovation?
- Do you have the resources? Talent, funding, good research data?
- What is the real goal? Scale, license, flip?
- Are there subsurface goals? Self-promotion, awards?
- Can you handle the challenge? Competition, naysayers, certification requirements, testing, government red tape, DoD timeframes, staying power?
- Do you or your organization suffer from NIH? Fear, pride, ego, blinders?
- How do you get going? Priorities, patents, brainstorming, market research, customer polling?

## Conclusion

The excitement of realizing your own ideas, inventions, or business models can carry you a long way through the minefields of entrepreneurship. Doing it more than once or doing it many times can be incredibly satisfying, whether you are financially successful or not. The drive and passion that serial entrepreneurs bring to the world is typically not measured in dollars earned – it's more often measured in the impact of the product, technology, or business one has created and shared.

At the same time, the serial entrepreneur must manage the endless struggle, stress, expense, and responsibility that creating and building brings with it. People often hear about successful products or people, but they rarely understand or experience all the work and struggle that went into those successes. In fact, they often assume *it just happened* or *it's easy.* I have had so many people react this way when they ask me what I do for a living. The think being a serial entrepreneur means you work for yourself, so you must be able to work when you feel like it and take lots of time off. Clearly, just the opposite is true; but they don't get it, and often, your own family will not *get it.*

The rewards can be huge and varied, and still, the stress and risk can take a toll that can never be paid back. Heart palpitations, lack of sleep, loss of self-worth, and even suicidal thoughts accompany many a serial entrepreneur. They might never admit, as that would take away from the mystique, but you must realize that every new product, technology, and business has the odds against it, and therefore, the odds are against the serial entrepreneur. And yet, the true serial entrepreneur keeps getting up, dusting off, and jumping right back in the ring, regardless of the challenge and the potential beating that may follow.

No book, course, or degree can ever impart the realities that face the serial entrepreneur. The only way to experience and learn from this is by doing it. It's an acquired taste that is certainly not for everyone. If you have good self-control and your

enthusiasm outweighs your fears, you just might be able to tackle this career. Or you can take a much safer route and get a nine-to-five job that provides a paycheck, on schedule every week. The choice is yours.

# Servant Leadership

Saundra J. Ribando
Augusta University, Augusta, GA, USA

## Synonyms

Stewardship; Transformational leadership

## Definition

Servant leadership is a values-based approach to leadership that emphasizes putting the needs of others before oneself.

## Servant Leadership

Robert K. Greenleaf (1977) developed the concept of servant leadership from an intuitive insight gained while reading Herman Hesse's book, *Journey to the East*. In the book, a band of men undertakes a long journey. The main character is Leo, a servant, who does the menial chores for the group. Along the way, Leo sustains them with his spirit and his song. When Leo disappears, the group falls apart and abandons the journey; the group cannot function without him. Years later, the narrator finds Leo and discovers that he is in fact the head of the Order that sponsored the original journey. Leo, who is first encountered as a "servant," is in fact a great leader.

From this story, Greenleaf drew many lessons about the role of the leader, and over time these lessons evolved into his concept of "servant leadership." The most important lesson is that the best leadership comes from those who possess a compelling vision or goal and have a genuine desire to serve others. To help clarify the concept, Spears (1998) draws upon Greenleaf's writing and proposes ten key elements of servant leadership. They are listening; empathy; healing (of oneself and others); awareness of others, situations, and

oneself; persuasion; conceptualization; foresight; stewardship; commitment to the growth of people; and building community.

The servant leader's behavior is grounded in his or her concept of self as a steward of the organization and its people. In this view, the servant leader holds the organization in trust to the public it serves (Greenleaf 1977). The leader's behavior is grounded in a strong sense of values or "virtue"; in this sense, it bears a resemblance to concepts of virtue ethics (Hursthouse 1999) and the "substantive justice" stage of ethical development (Rest and Narvaez 1994). Stewardship is what ensures the servant leader does not accept mediocre performance and keeps everyone focused on achieving organizational objectives within the constraints of shared organizational values. This view coincides with Gawthrop's (1998) call for a public service staffed with ethical public servants as opposed to relying on ethics based on conformity to rules.

This focus on objectives is balanced by a deep commitment to the growth of people and the building of community within the organization. An important component of this is the active partnership between the leader and the followers. The critical challenge for any would-be servant leader is to work with followers to create the vision and goals that guide the organization, balancing "the organization's need for effectiveness with employee's needs for personal growth, purpose, and richer meaning in their work" (Bowen et al. 2015). As the litmus test for servant leadership, Greenleaf (1977) proposes that the best test for servant leadership is: "Do those served grow as persons? Do they, while being served, become healthier, wiser, freer, more autonomous, more likely themselves to become servants? And, what is the effect on the least privileged in society: will they benefit, or, at least, not be further deprived?" In sum, the servant leader is a steward who holds the organization in trust to the public it serves while remaining intimately attuned to the needs and situations of those who work in the organization and sincerely committed to empowering others to succeed professionally and personally.

## Servant Leadership and Leadership Theory

How does servant leadership compare with other leadership theories and concepts? Greenleaf (1977) grounded his conception of servant leadership in Christian religious teaching, but servant leadership also shares many of its ideas with other leadership theories.

Servant leadership calls leaders to build people and community, to dream great dreams and instill those in others, and to heal people in the organization. As such, it is similar to the major idea behind transformational leadership. Transformational leaders are charged to help build organizational vision, to mobilize the organization to achieve that dream, and to institutionalize whatever changes are needed to make the dream become reality (Bass 1996). Transformational leadership is about healing broken organizations and pulling them, through the beauty of a shared vision, into new ways of being and doing. In this respect, servant leadership is transformational leadership.

However, servant leadership does differ from transformational leadership theory. For example, Bass (1996) acknowledges that transformational leadership can be authoritarian as well as participative. This stands in stark contrast to Greenleaf's (1977) suggestion that the leader should be the primus inter pares or "first among equals." By listening, conceptualizing a vision that others can respond to, and using persuasion, the servant leader avoids coercion and seeks to become a partner with workers in building community in the organization. Finally, Bass (1996) proposes that transformational leaders transcend their personal self-interests for *either* utilitarian or moral purposes. In contrast, Greenleaf (1977) stresses the moral component of leadership virtually to the exclusion of utilitarian concerns.

In addition, Greenleaf (1977) suggests that leadership is intricately bound up in culture and servant leaders must actively work to build a culture of trust in organizations. Fairholm (1994) proposes that leadership seeks to build community in an organization. Leaders are charged with developing and fostering organizational value

patterns and norms that respond to the needs of individuals and groups for order, stability, and meaning. Consequently, Fairholm (1994) recommends leaders bring perspective, guiding principles, a clear platform or statement of one's principles, and a sense of purpose to the organization. These ideas are echoed in Greenleaf's (1977) insistence that servant leaders listen to and be aware of the needs of those within the organization, conceptualize a vision for the organization, and become stewards of and build the organizational community.

## Servant Leadership, Trust, and Building Community

Greenleaf (1977) suggests that servant leadership produces organizational success because it builds or creates a trusting, supportive community that fosters creativity and initiative. In this sense, servant leadership is the independent variable that causes or produces a culture or community of trust that in turn produces organizational success. Thus, trust serves as an intervening variable between servant leadership (the independent variable) and organizational success (the dependent variable). Both Greenleaf and Fairholm (1994) presume that leaders, through their control over information sources and organizational rewards and sanctions, are the principal architects or creators of organizational culture.

Fairholm's concept of a "culture of trust" also illustrates the connection between leadership, organizational culture, values, trust, and performance. According to Fairholm, leadership "facilitates joint action by accommodating difference and redirecting it to joint action (1994, 56)." Leaders, in his view, are responsible for building an organizational culture founded on trust that will, in turn, produce organizational success. Leaders are called to exhibit predictability and consistency within an open and ethical climate in order to build the "culture of trust."

Values, according to Fairholm (1994), are at the core of organizational culture (1994). Among his "elements of a trust relationship," Fairholm lists authentic caring, ethics, individual character (expectations of openness and trust), and leadership with a service orientation. The view of ethics he advances is consistent with the substantive justice stage of moral development (Rest and Narvaez 1994). Fairholm (1994) proposes that leaders build trust in organizations by fostering participation, engaging in helping relationships with employees, actively listening to workers, and using a consistent leadership style.

The parallels with servant leadership are clear. Servant leadership is leadership squarely based on values (Greenleaf 1977), specifically values of trust, respect, and service. Fairholm's "elements of a trust relationship" are echoed in the servant leader's elements of listening, healing, empathy, awareness, and stewardship (Spears 1998). Greenleaf's (1977) call for leaders to serve as primus inter pares is clearly participative leadership. The emphasis on healing, empathy, awareness, and listening in servant leadership is identical to Fairholm's "helping relationship" and "active listening" ways of developing a culture of trust.

## Servant Leadership and Organizational Performance

Servant leadership has received increasing levels of attention over the past 10 years. In the for-profit sector, servant leadership has been linked to both an individual employee's customer service orientation and the development of an organizational culture that highly values customer service. Essentially, a servant leader propagates a customer service attitude by modeling for employees. This modeling is particularly powerful for less experienced employees who may focus on completing short-term sales, cost-cutting, or profit goals instead of building long-term relationships with customers founded on service quality and trust.

This customer focus produces a wide range of positive outcomes for businesses. For example, servant leadership and its customer orientation have been shown to promote employee creativity. Employees working in such an environment have higher levels of job satisfaction and are more

committed to the organization. As a result, servant leadership results in higher-performing employees with lower levels of stress who are less likely to leave. The end result is a profitable business (Liden et al. 2014).

Moreover, workplaces led by servant leaders are places where workers exert more control over their work. In short, workers are empowered. Such workplaces are characterized by higher levels of job satisfaction and commitment to the organization, lower levels of job-related stress, and less turnover intention (Bowen et al. 2015).

The same dynamic relationship between supervisors engaging in servant leadership behaviors and employees works in the public sector. But in the public sector, agencies and their employees must do more than simply serve "customers." In this environment, every decision is an ethical decision as it impacts, directly or indirectly, the public it is intended to serve. Thus, a leadership approach founded on the concept of stewardship and based on ethical principles would be ideal. In this regard, servant leadership does appear able to develop an ethical atmosphere that promotes a service attitude (Shima et al. 2016). Servant leadership would seem the perfect fit for the public sector.

# Service Charters

Andrés Navarro Galera
University of Granada, Granada, Spain

## Synonyms

Citizen charters; Customer charters; Service charters

## Definition

Following the European Public Administration Network (EUPAN 2008), "key to a citizen charter is an organizations commitment to the customer about the quality of its services the customer can expect. Citizen charter is a policy term, in practice also called service guaranteed or service standard." Citizen charters form a part of the range of ideas around total quality management although other tools can also be used. Consequently, citizen charter can easily be combined with CAF, EFQM, BSC, customer satisfaction survey, process management, or comparable operational management instruments like customer journey mapping, usability testing, and website analysis.

According to OECD et al. (2007), a service charter may be defined as a public document that sets out basic information on the services provided, the standards of service that costumers can expect from an organization, and how to make complaints or suggestions for improvement.

A service charter is a short publication that informs the client about the agency's services, outlines relevant avenues of communication, details relevant service standards, and outlines client rights and responsibilities including feedback and available complaint mechanisms (Australian Public Service Commission 2004; Economic Regulation Authority 2006).

A customer charter is a short statement describing the level of service a customer can expect from a public service organization (government departments, offices, bodies, agencies, etc.) (Department of Public Expenditure and Reform, Ireland Government 2012).

The Treasury Board of Canada Secretariat (2012) indicates that a service standard is a public commitment to a measurable level of performance that clients can expect under normal circumstances. A client is the intended recipient of a service. Clients may be external to the government (e.g., citizens, businesses, nonprofit organizations) or internal to the government (e.g., departments).

The Spanish Ministry of Finance and Public Administration (2015) has affirmed that the SC, as tools for continuous improvement of services, are documents for public organizations to report on the quality commitments of services that manage and provide, in response to the needs and expectations of citizens and users as well as to the demand for transparency.

## Introduction

Based on Hood (1991, 1995), the *New Public Management* postulates (NPM) include:

(a) Greater emphasis on citizens' satisfaction as a "client" of public sector services
(b) Greater emphasis on management and accountability assessment methods
(c) Opening up of public entities to competition
(d) Development of arrangements for the systematic comparison of activities between management units (benchmarking)
(e) Separation of policy-making from service delivery and the creation of agencies to deliver services

Although NPM postulates have gained ground in the Anglo-American administrative culture model (the UK, Australia, New Zealand, Canada, the USA), supranational organizations and bodies (OECD, the World Bank, IFM) have spread the Anglo-American experience all over the world. So, since the 1980s, public sector reforms have been place in many countries at the international scale, based on the NPM movement. Under the NPM reforms, the main principles are (a) improvement of the quality of public services, (b) customer satisfaction as key objective of government services, (c) culture of serving customers and clients, and (d) transparency as a tool to involve the citizens in public management.

In this context, service charters (also called citizen charters or customer charters) are a part of the much bigger NPM agenda (Drewry 2005; Hood 1991). The user's charter was a culmination in a trend of gradual administrative reform in the late 1980s and a common occurrence in many western countries in those days (Van de Valle et al. 2005).

During the last years, improving the quality of public services has become a major theme on the public sector reform agenda all over Europe and beyond, and most public agencies are nowadays looking at how to get started on the quality journey or how to develop existing quality management projects further (OECD et al. 2007). In these reform processes, various international organizations have defined service charter in governmental entities (SC) as an essential tool for continuous improvement of the quality of public service.

So, the added value of a citizen charter is that, in a very manner, the organization makes contacts with the outside world. By making promises

concerning the quality of the services, a charter contributes toward the relationship with citizens and firms in the outside world. A citizen charter makes public organizations transparent and by consequence open to challenge on performance.

Coinciding with all these approaches, OECD et al. (2007) have identified the next benefits of SC:

(a) Help public agencies to manage the expectations of service users.
(b) Provide a framework for consultations with service users.
(c) Encourage public agencies to measure and assess performance.
(d) Make public agencies more transparent by telling the public about the standards they can expect and how agencies have performed against those standards.
(e) Push publish agencies to improve performance where promised by standards have not been achieved.
(f) Increase satisfaction of service users.

In an opinion from the Spanish Federation of Municipalities and Provinces (2011), the fundamental mission of the SC is to define and disclosure the service commitments assumed by the public authorities to respond to the requirements of citizenship, as well as to assess the degree of fulfillment of these commitments and communicate the results achieved.

Citizen charters were pioneered in the UK, in the wake of a broader privatization program. The Citizen's Charters, introduced by John Major, were of special relevance when it was deemed that privatization, in the traditional sense of transferring ownership from public to private hands, was neither feasible nor desirable (Clifton et al. 2005). Following the UK's first initiative, many countries embarked on designing and implementing charter approach to efficient and effective delivery, including Australia, Canada, Italy, Belgium, Spain, Portugal, Sweden, the Netherlands, India, the USA, Argentina, Costa Rica, Hong Kong, Namibia and Samoa, and South Africa (Nigussa 2013; Clark 2012; OECD et al. 2007; Parrado 2006; Drewry 2005).

## Content and Characteristics of the Service Charters

In the different countries where SC have been developed, the legal regulations and guidelines issued indicate the content that these documents must include, as a general framework that each organism adapts to its quality commitments about the services provided to citizens.

The European Public Administration Network (EUPAN 2008), taking as a reference the Netherlands practices (advocated under the Burgelinn-program), proposes ten guidelines for preparing policy choices on form and content of contacts with citizens, which are the next:

1. Choice of channel. As a citizen I can choose for myself in which way to interact with the government. The government ensures multichannel service delivery, i.e., the availability of all communication channels: counter, letter, phone, e-mail, and the Internet.
2. Transparent public sector. As a citizen I know where to apply for official information and public services. The government guaranties one-stop-shop service delivery and acts as one seamless entity with no wrong doors.
3. Overview of rights and duties. As a citizen I know services I am entitled to under which conditions. The government ensures that my rights and duties are at all times transparent.
4. Personalized information. As a client I am entitled to information that is complete, up to date, and consistent. The government supplies appropriate information tailored to my needs.
5. Convenient services. As a client I can choose to provide personal data once and to be served in a proactive way. The government makes clear records it keeps about me and does not use data without my consent.
6. Comprehensive procedures. As a citizen I can easily know how the government works and monitor progress. The government keeps me informed of procedures I am involved in by way of tracking and tracing.
7. Trust and reliability. As a citizen I presume the government to be electronically

competent. The government guarantees secure identity management and reliable storage of electronic documents.

8. Considerate administration. As a citizen I can file ideas for improvement and lodge complaints. The government compensates for mistakes and uses feedback information to improve its products and procedures.
9. Accountability and benchmarking. As a citizen I am able to compare, check, and measure government outcome. The government actively supplies benchmark information about its performance.
10. Involvement and empowerment. As a citizen I am invited to participate in decision-making and to promote my interests. The government supports empowerment and ensures that the necessary information and instruments are available.

Following the Economic Regulation Authority Western Australia (2006), an SC can be defined as a published statement containing (a) a list of customer entitlements, (b) details regarding a licensee's services, and (c) information relevant to the relationship between the customer and the licensee.

According to the Department of Public Expenditure and Reform (Ireland Government), every costumer charter should:

(a) State the organization's commitment to providing services to its customers in accordance with quality service principles and in line with public service reform plan (this might include a short mission statement and description of the services provided)
(b) Define service standards in clear terms and simple language
(c) Inform customers how to make a complaint or a suggestion (including, if appropriate, forms of external redress/appeal)
(d) Include the date of the charter and contact details

In Canada, the Treasury Board of Canada Secretariat (2012) has indicated that the content of the SC must meet the next characteristics:

1. Relevant to the client. Service standards are consistent with client priorities and address aspects of the service they value the most within available resource allocations.
2. Based on consultation. Service standards are developed in consultation with clients, managers, staff, and other partners in service delivery to ensure that they are meaningful and match the organization's mandate.
3. Measurable. Service standards are quantifiable and linked to monitoring activities.
4. Consistent across the government. Service standards should be consistent throughout federal organizations providing similar services. Having similar service standards across the government for similar services helps both clients and the government. The client will find it easier to deal with different organizations, and the organizations themselves will find it easier to share best practices and adopt common approaches.
5. Ambitious but realistic. Service standards are realistic, based on analysis, and consistent with objectives yet sufficiently challenging to service providers.
6. Endorsed by management. Service standards are understood and endorsed by the senior management.
7. Communicated. Service standards are clearly communicated to clients, employees, and other stakeholders to help manage expectations.
8. Transparent. Service standards are monitored and reported to the senior management, and performance results are published to ensure transparency and client trust.
9. Continuosly updated. Service standards are regularly reviewed and updated as appropriate.

In other cultural context, the Spanish Ministry of Finance and Public Administration (2015) establishes the essential content of the SC in a governmental entity, including three key elements: (a) describing the services provided, (b) establishing quality commitments, and (c) measuring compliance with the commitments (indicators).

## Guidelines to Elaboration and Management Process

At the international level, some guidelines have been issued to orient governmental agencies in developing the informative content of the SC, helping them in the management and monitoring of commitments as elements of continuous improvement of the quality of services provided to citizens.

The European Public Administration Network (EUPAN 2008) establishes seven steps to implement a citizen charter with service standards in governmental organizations, proposing some actions individually, according to the following details:

Step 1. Decide to introduce a citizen charter. Actions: (1) communicate within the organization the decision to introduce a charter, preferably specifying an introduction target date; (2) designate a project leader and allocate budget; and (3) be clear about what you want to achieve with the charter and how it will operate in practice; do not be afraid to be flexible in interpreting these guidelines to fit your own circumstances and business need.

Step 2. Draft a set of service standards. Actions: (1) inventory who to conduct first; (2) draft a set of service standards; and (3) reach agreement with the top management in the form of making apologies when a standard is not met.

Step 3. Consult staff about service standards. Actions: (1) plan a meeting with all concerned and discuss service standards with all relevant work process participants and (2) write the final set of service standards.

Step 4. Write a citizen charter. Actions: (1) organize implementation of a citizen in an organization, including registration of results; (2) provide communication material and have it tested; (3) decide duration of test period, as appropriate; and (4) produce a document addressing all aspects of a citizen charter and submit for final approval.

Step 5. Publish with style. Actions: (1) make an inventory of the various formats of the charter (brochures, letters, the Internet, flat screen, local paper); (2) organize styling (brochures, etc.) to be done by a professional designer; and (3) agree on a planning that ends on the date of publication.

Step 6. Control organize embedding of the charter in the organization. Actions: (1) organize registration of results (degree to which standards are being met); review possible ICT applications; (2) write an action plan to ensure that results at the operation level are on the agenda of regular progress meetings.

Step 7. Integrate the citizen charter in the improvement cycle. Actions: (1) decide the date of the evaluation of the service standards; (2) prepare pro arguments for possibly required modifications of service standards; and (3) once modifications of service standards are required, plan for the implementation of the contemplated modifications.

On the other hand, OECD et al. (2007), in its Handbook for Improving Quality of Public Services, raise three issues to develop and manage a CS in public entities, which are how to draft a charter, finalizing your draft charter, and how to use a charter for service improvements.

How to draft a charter. The handbook proposes a guide through all the steps and phases in the implementation of the SC, which are the next: (1) define the concept of quality of your organization; (2) establish a hierarchy of objectives; (3) define performance indicators and targets; (4) map your stakeholders; and (5) draft your charter.

Finalizing your draft charter. The handbook shows how to gain ownership for the service charter inside and outside your organization by consulting with staff and service users on your draft charter. It also gives you a checklist to improve your complaints and suggestions system. Last but not the least, it gives you proposals on how to communicate your service charter to its target groups. To achieve these purposes, the handbook includes the following sections: consult effectively with your staff on the draft charter; consult effectively with the target group of your charter; implement a complaint and suggestion system; and promote and communicate the charter.

How to use a charter for service improvements. The handbook explains how to evaluate the performance of public entities against the promises set out by the charter and how to develop and implement service improvement, including the next issues: monitor service and quality standards, collect subjective performance information, draft service improvement action plans, and make service improvement sustainable.

In the case of Ireland, the Department of Public Expenditure and Reform (2012) indicates that the charter customer initiative involves four steps: (1) consultation with customer/stakeholders, (2) commitment to service standards, (3) evaluation of performance, and (4) reporting on results.

Beginning with the first phase (consultation), in their dealings with the public, civil service departments and public service offices will provide a structured approach to meaningful consultation with, and participation by, the customer in relation to the development, delivery, and review of services. External customers might include customers who are in receipt of the services your organization provides, persons who used your services in the past, potential new customers, and other public service organizations, including local offices, private sector organizations, voluntary and community organizations, consumer groups/focus groups/user panels, representatives of specific customer representative, or other interest groups.

The next stage in the development of a customer charter is the setting of, and committing to, service standards. Having consulted with customers and stakeholders, organizations will have a clear picture of customer expectations, which will allow organizations to set objective service standards. Service standards should be set on the basis of what customers have identified as being important in improving their satisfaction with services provided, by looking at the guiding principles and seeing which ones lend themselves to commitments in a customer charter, in partnership with the staff who will be delivering the service and who are well positioned to judge what the customer wants, to be both directly measured by tracking systems and indirectly measured by suitable performance indicators, and to be consistent with wider public service reform objectives.

Turning step 3 (evaluation of performance), the evaluation is the process of examining (or surpassing) the service standards set down by customer charters. Effective evaluation tells you what worked and what did not and where greater attention might need to be focused. It is essential that organizations rigorously evaluate performance against the service standards set out by the customer charter in order to (a) ensure accountability for delivery of those standards by organizations and (b) facilitate learning and continuous improvement in customer service. There a number of methods organizations can use to evaluate performance. In this phase, the evaluation methods to be considered include customer surveys, customer panels/focus groups, complaint systems, comment cards, face-to-face interviews, mystery shopping, tracking systems (e.g., telephone and correspondence tracking), employee surveys/staff suggestion schemes, and external validation of self-assessment schemes.

Finally, the reporting of results should be based on the output of the evaluation carried out under the customer charter process and should provide clear information about the service standards/performance indicators, how performance has been measured (and this results, including details of complaints), whether those standards have been achieved, and the next steps in the customer service improvement process. Clarification and consistency are crucial aspects of reporting on results, especially where the process is continuous and where customers and observers will be seeking to compare issues over time. Where service standards have not been met, it will be necessary to identify how it is intended to meet those standards in the future.

In Canada, the Treasury Board of Canada Secretariat (2012) indicates that the following five phases of service standard management support the creation, implementation, and assessment of service standards from an organizational perspective: (1) establish priorities, (2) plan and develop service standards, (3) implement service standards, (4) measure performance against service standards, and (5) act on the results. Within an

overall process, these phases are developed through 15 steps in a sequential order.

Phase I. Establish priorities for service standards.
- Step 1. Take stock.
- Step 2. Connect service standards to organizational priorities.

Phase II. Plan and develop service standards.
- Step 3. Develop service standards.
- Step 4. Asses monitoring capacity.
- Step 5. Validate proposed service standards.
- Step 6. Determine the performance methodology and measurement framework.

Phase III. Implement service standards.
- Step 7. Establish an implementation plan.
- Step 8. Determine if new processes are required.
- Step 9. Train staff and service delivery partners.
- Step 10. Communicate service standards.

Phase IV. Measure performance.
- Step 11. Measure performance.
- Step 12. Evaluate findings and report to the senior management.
- Step 13. Publish results for clients.

Phases V. Act on the results.
- Step 14. Determine the course of action.
- Step 15. Implement changes.

In Spain, the Ministry of Finance and Public Administration (2015) has defined the set of phases that must integrate the life cycle of an SC in public entity, establishing their connection with transparency and accountability:

Phase 1. Elaboration. Transparency and accountability: citizens, associative entities, responsible for transparency unit

Phase 2. Approbation. Transparency and accountability: responsible for transparency unit

Phase 3. Tracing. Transparency and accountability: responsible for transparency unit

Phase 4. Evaluation. External organizations for each public entity

Phase 5. Updating. Transparency and accountability: citizens, associative entities, director responsible of SC, coordinator/manager of the SC, responsible for transparency unit

## Experiences in Some Countries

At the international scale, the initiative on citizen charters in the UK was pioneer. Indeed, based on the UK's first initiative, many countries embarked on designing and implementing charter approach to efficient and effective service delivery. Literature reveals that the first initiative for Citizens' Charters happened in the early 1990s in the UK under the then Prime Minister John Major. However, at the local level (Harlow and York) and in Inland Revenue, the origin of citizen charters dates back to the late 1980s (Nigussa 2013; Clark 2012). The first six major principles of this initiative were the following: (1) setting, monitoring, and publication of explicit standards; (2) information for the user and opening in the availability of that information; (3) choice wherever practicable, plus regular and systematic consultation with users; (4) courtesy and helpfulness; (5) well-publicized and easy-to-use complaint procedures; and (6) value for money.

Following Parrado (2006), the charter standards were often too vague to be meaningful and largely devised without consulting with the full range of stakeholders. In parallel, the House of Commons (2008) indicates that the "customer" rhetoric of citizen charters sometimes created a "money-back" mentality and even misuse of financial redress. The citizen charter program was rather confused – promises contained in the charters were often vague and ambitious, confounding the aim of defining a tangible set of entitlements to public services that people could readily understand and use.

As DARPG (2013) shows, the UK Parliament (2008) stated that the Charter Mark was an integral part of the citizen charter program. It was launched in 1992 as an award for organizations that had achieved excellent customer service in the public sector. To win a Charter Mark, the organization has to demonstrate excellence against the following nine Charter Mark criteria which correspond to the principles of public service delivery, namely, (1) performance standards, (2) information and openness, (3) choice and consultation, (4) courtesy and helpfulness, (5) putting things right, (6) value for money,

(7) use satisfaction, (8) improvements in service quality, and (9) planned improvements and innovations. In the UK, actually there are around 1,600 organizations with a Charter Mark, with some 400,000 people working within those organizations. This represents about seven percent of the public sector (Nigussa 2013). EUPAN (2008) has analyzed the experiences of SC in the municipality of Sutton.

Turning other countries, authors as Torres (2005, 2006) concluded that although SC is widespread in Anglo-American and EU countries, there are significant differences in the way they are constructed and used. An explanation for these differences can be that the countries do not think the same about the role of the state and its relationships with citizens.

Following authors as Kickert (2007), Torres (2006), and Navarro and Rodríguez (2011), Hill (2007) in Western style, there are three administrative cultures and styles of public management, which can determinate the transparency and accountability approach in governmental organizations. These types of style of public administration are the following: Anglo-American, Continental European, and Nordic.

In the USA, the implementation of SC was carried out within the framework of the National Performance Review (Jain 2001). Through the NPR program, the USA is committed to making the government more responsible and improving its public image, emphasizing the need for democratic of departmental and agency officers, to increase trust in the government through the empowerment of employees. The main objective of the administrative reform undertaken in 1993 by the US government was to improve the public service quality, using SC as a tool that must include becoming more accessible, providing quality customer service, and measuring customer, history (creating a customer-focused government), information for senior executives and federal appointees, and customer service quiz.

In Australia, the UK initiative was the basis to SC. Putting service first is Australia's government service charter program, which was introduced at the federal level in 1997. The Ministry for Consumer Affairs, Food and Public Distribution has the responsibility for overseeing the implementation SC, which are applied to all commonwealth government agencies and departments. All agencies are required to conduct an external performance audit against charter objectives every 3 years and the must to report annually on their performance against the charter to the Department of Finance and Administration.

In Ireland, after publishing the policy actions in "Delivering Better Government," a working team was formed to implant the SC, which since 2000 includes the general secretaries of all government departments. The key areas of the SC are delivering a quality customer service, reducing red tape, delegating authority and accountability, introducing a new approach in the human resource management, ensuring value for money, and supporting change with information technology.

Turning the continental European countries, in Italy, as in the USA and Australia, no standard is set on the national level and a bottom-up is preferred. The Italian SC include a system of compensation that is note regulated by law and may be different for each service. The Carta dei Serizi was implanted in 1993, considering the SC as an agreement between the producer and the consumer of public services (Mussari 1998).

In Belgium, La Charte de l'utilizateaur des Services publics was launched in 1993. As Torres (2006) indicated, it is a kind of formal directive whose objective is to encourage the federal administration to improve the quality of services delivered to citizens. The SC is based on the principles of transparency, flexibility, and legal protection, and it includes three sections: general principles, measurements, and stated principles. Van de Valle et al. (2005) concluded that, in Belgium, the introduction of a user charter and the launch of the Copernicus reform were definitely political events and not merely administrative ones.

In France, La Charte des Services was published in 1992, and it is a regulation of the relationship between citizens and public services, and it is a matter of the judicial system rather than executive self-regulation. The Charter des Services publics is based on the following principles: transparency and responsibility, simplicity and

accessibility, participation and adaptation, and trust and reliability. The experience of SC in Marianne Label service commitments can be studied in EUPAN (2008).

In Spain, the Royal Decree 1259/1999 introduced the concept of "citizen first," establishing linking service charters with prizes for best practice and quality awards. Later, the Royal Decree 951/2005 has established a general framework to improve of the quality in public administration. In Spain, the SC must include a minimum content: (a) commitments and service quality indicators for measuring achievement; (b) relief measures, compensation, or redress in case of default; and (c) informative document.

For the EU countries, Clifton et al. (2005), using a four-stage model of the international NPM convergence analysis, have examined and compared to the Anglo-Saxon experience the four phases of the Charter for Services of General Interest experience. These authors conclude that though there are important similarities linking the charter initiatives in the EU and the Anglo-Saxon world, there are also a number of important differences, which can be explained by the project to construct a supranational political citizenship, as well as institutional differences in capabilities related to EU competences and issues of governance.

In Nordic countries, CS initiatives were launched into Finnish public policy in 1997, based on the next basic principles: promise to service users to produce quality services, a flexible and customer-centered approach to service provision; customer feedback and the correction of errors, a description of the service in a service specification; and efficient production of the best possible service. In Sweden, the parliament issued the Citizen's Service Act, providing the basis for local charters and emphasizing commitment, quality, choice, standards and measurement, value for money, and competition (Kuuttiniemi and Virtanen 2008). In 2001, the Swedish government announced a "service dialogue" pilot project, including a move to develop citizen charter in every government agency. EUPAN (2008) has published the experience of SC in the municipality of Sevenum (the Netherlands).

With respect to other countries, authors as Löffler, Parrado, and Zmeskal have studied the experience of the Ministry of Interior of the Czech Republic (OECD et al. 2007) about SC. Likewise, EUPAN (2008) shows the practices of SC in Estonian Tax and Customs Board or of Malta, and Nigussa (2013) has studied the CS implementation process in India or South Africa, concluding that the lack of stakeholder consultation due to the top-down approach of the initiatives together with inadequate designing and implementation capacity of owned departments counts more. The design and implementation challenges in the case of India and South Africa attribute to lack of customization. Both countries seem to copycat the experience of the UK with little attention paid to the local context: organizational culture, existing expertise, service seeker culture of transparency, and appeal among others.

## Conclusion

Improving the quality of public services has become a major theme in the public sector reform agenda all over Europe and beyond, and most public agencies are nowadays looking at how to get started on the quality journey. In this context, under the reform process, various international organizations have identified service charter in governmental entities as an essential tool for continuous improvement of the quality of public service.

The next ten guidelines can be useful for preparing policy choices on form and content of contacts with citizens: (1) choice of the channel, (2) transparent public sector, (3) overview of rights and duties, (4) personalized information, (5) convenient service, (6) comprehensive procedures, (7) trust and reliability, (8) considerate administration, (9) accountability and benchmarking, and (10) involvement and empowerment.

At the international scale, some guidelines have been issued to orient governmental agencies in developing the informative content of the service charter, which can help them in the

management and monitoring of commitments as elements of continuous improvement of the quality of services provided to citizens, such as EUPAN and OECD.

## Synonyms

Imperatives of sound governance; Nigeria service compact; Public service outcomes; Public service performance

## Definition of Operative Terms

| | |
|---|---|
| Service | This denotes deliberate, paid, or free rendition of competences, practices, or assistance provided by or received through public or private relationships for someone or something. Service is the matrix and measure of all competences, interoperations, and capacities. |
| Public service | This is primarily the service of the state by the people and the people by the state. This is effected through procedural execution of public policies in the conduct of government businesses, at the various tiers of public interoperations and/or organizations, for overriding public good and development. |
| SERVICOM | Simply means *Service Compact* between Nigerian government and the people of Nigeria. It demonstrates Nigerian government commitment to citizen-centric governance and the upholding of the people's right to be served right at all times. |

## Introduction

Nigeria plays an inextricable role in Africa international economic relations. As the largest economy and most populous state in the entire continent of Africa, the continued underdevelopment and devaluation of Nigeria's public service is a huge concern. For many years and under different political regimes – civil and military – public governance in Nigeria was ineffective, unpopular, and counterproductive in many respects. In 2004, Nigerian government, piqued by decades of public sector gross mismanagement and dismal service outcomes, entered into service pact otherwise referred to as SERVICOM with Nigerian public and civil servants at all levels and tiers to check public malpractices and reengineer, revolutionize, and institutionalize citizen-centric service platforms across all public sector organizations. This follows the radical recognition by government that its organizations clearly render bloated service outputs and inequitable outcomes. As Obasanjo observed: "Public offices are the shopping floor for government business. Regrettably, Nigerians have for too long been short-changed by the quality of public service delivery by which decisions are not made without undue outside influence, and files do not move without being pushed with inducements. Our public offices have for too long been showcases for the combined evils of inefficiency and corruption, whilst being impediments to effective implementation of government policies. Nigerians deserve better. And we will ensure they get what is better!" (NCC on SERVICOM 2015) This informed the various concerted and spirited efforts of the Nigerian government at various regimes to reform the Nigerian public service along the line of the new public service system. One of such initiatives is the Nigerian Service Act of 2004 which christened SERVICOM, which demands all

public institutions, ministries, departments, agencies, or parastatals at all tiers of governance to "produce a service charter derived from their mission statements, create a SERVICOM Unit, and appoint a Nodal Officer to head the unit with a complement of 3 other staff to drive service delivery and improvements in the MDA." (NCC 2015: 2)

Therefore the discourse on service as the matrix of good governance is the examination of SERVICOM and the barriers to efficient public service delivery in Nigeria using the Federal Teaching Hospital, Abakaliki (FETHA) as the basis of analysis. It begins with the analysis of service as the matrix of good governance.

## Service and Good Governance

In all spheres, Africa, Europe, Americas, Asia, and the Pacific, service provides the central gauge for public governance. Good governance is determined by the effectiveness and efficiency of services. As good governance indicator, service is the subject and object of public governance. It is the matrix from which sound, proactive, and responsive initiatives develop. Service is the center and definition of all activities of public-private sector organizations and/or governance. That is, since government is constituted to serve the people and ensure public good, good governance is measured by the quality and quantity of those citizen-centric and people-driven services. Service outcomes therefore determine the input-output variance of an organization and should be sufficiently enabled (input variance) to ensure competence, legitimacy, equity, efficiency, corporate good, and responsibility (output variance). It is a marketplace variance, that is, it is determined, measured by the extent of its marketability, competitiveness, and quality assurance. Atiku Abubakar in his critical notes on Nigeria analyzed the imperatives of good governance and development in advancing and consolidating Nigeria's political socialization and democratization, while Farida Waziri (2009) argued on the primacy of developing and building citizen-centric political institutions as critical conditions for good governance and popular leadership in Nigeria. She stressed that Nigeria experience clearly demonstrates that poor leadership and lack of political transparency among others constituted the crisis and challenges of good governance in Nigeria.

However, events of the twentieth and twenty-first centuries' globalization complexes appear to have pulverized the commonest definition of good governance reflecting at most a notional paradigm shift in what could be generally accepted as good governance practice. Theorist and political critics have become all the more polarized and divergent while attempting to conceptualize the subject and object of good governance. Ali Farazmand perceives the term as highly loaded with normative values. He theorizes the concept of "sound governance in the context of increasing global complexities, challenges, threats, and opportunities affecting the world's institutions today" (Sound governance 2004). The term arguably appears more subjective than objective, for instance, the Chilean Pinochet dictatorship was largely acclaimed as good government by the frontline hegemonic countries but condemned nationally as bad government, neo-colonization, and dictatorship in Chile and elsewhere. Conversely the phenomena of bad governance sometimes convulsed by the overarching impact of globalization abound in most developing countries especially Africa of the sub-Sahara ridden with political stooges, personal rule, and rentier states. These often orchestrate and precipitate divergent sums of sociopolitical implosion, frequent regime change, unbridled corrupt practices, subnational loyalty, cronyism, internecine violence and insurgency, and protracted political apathy among the peoples and regions of African and Asian continents with obvious reverberating global consequences. Ali Farazmand critically conceptualized sound governance as holistic, humanistic, and proactive based on the criticality of globalization complexes. Sound governance obviously defines the critical role of international community, globalization, and hegemonic governments/powers like former colonial and imperialist states of the USA, the UK, France, and China

along with World Bank and IMF in championing the course of human dignity and rights, strengthening democratic dispensations and rule of law, collegiality, and human capital, and deepening the culture of responsible governance and government accountability and service-oriented citizenship among developing countries. In this context, the notion of good governance is consistent with the Farazmandian theory of sound governance.

Service is therefore argued as the matrix and product of good and/or sound governance, citizenship, and overall sound intergovernmental relationships. It is the critical mass that defines a people and nation and unites or alienates government and governance essentially. Service is the beginning, means, and end of all human activities and practices at different spheres of life. Shirley Chisholm (1924–2005) insists that service is not only inevitable and human, it is a way of life: "it is the rent that you pay for room on this earth." (https://www.brainyquote.com/authors/shirley_chisholm) Service is not only character definition but begins with serving the nation in one's neighbor. Ipso facto, a viable, democratic, and responsive public service practice is critical to the development of efficient private-sector-driven economy needed for Nigeria-African development. To wit, sound governance naturalizes responsible citizenship and, ipso facto, the foundation for national development. The discourse on service suffices the critical measurement of the matrix of sound governance in Nigeria's public service since what affects Nigeria invariably and directly affects Africa.

## Perspectives of Nigeria Public Service Compact: Issues Analysis

The review of relevant literature widens scientific perspectives. It garners polemic and comparable ideas and measures and articulates relevant issues, variables, and literary horizons. The aim is to understand the historical context, intensity of the problems, and capacity of SERVICOM to address identified issues. It further gauges the challenges facing the execution of Nigeria Service Act as implemented by SERVICOM against the standard indices of performance.

### Understanding the Need for Efficiency in Public Services in Nigeria

Successive Nigeria governments since the 1960s have continually engaged in seemingly unending political and economic debates to decipher ways and means to entrench effective, responsive, and accountable service system in Nigeria. This is premised on the fact that good and responsible government is the product of efficient, responsive, and accountable public management that is legitimate, democratic, citizen-driven, and citizen-focused. The essence of governance is not for its own sake but instituted and constituted by the people and for the service of the people. Arguably, efficient and accountable public management system presupposes and endears good and/or sound governance which cannot be characterized by public disservice; lack of basic freedoms; political impunity; citizen apathy; lack of respect for rule of law; autocratic, idiosyncratic, and unpredictable leadership; cronyism; and unbridled corrupt practices (Larbi 1999: 10). Rather, efficiency, accountability, effectiveness, responsiveness, and responsibility in public management are essentially good governance indicators and have increasingly become compelling factors for various sums of Oversea Development Assistance (ODA), United Nations Development Projects (UNDPs), United States Agency for International Development (USAID), and essentially the New Partnership for Africa's Development (NEPAD) (Larbi 1999: 10).

The need for efficient reform in the Nigerian public service organization further results from the extremely poor economic average and poor per sector GDP. Iloh et al. (2012: 1) argue that government-owned public establishments in Nigeria have received the highest level of negative societal criticisms. "These negative comments range from poor quality of service delivery to service delay, discontinuity of care, indifferent staff attitude, and bureaucratic procedures. These negative comments have led to poor public confidence in healthcare and made the government hospitals unattractive to the consumers of hospital services." Studies revealed that public sectors in most third world countries, especially sub-Saharan Africa, are not only

symptomatic of general poor governance, high levels of public corruption, and weak institutional frameworks, rather, they signal the worst tendencies of the "dead hand" of bureaucracy, probably the least ebb of political will and cumbersome red-tapeism due to "accumulation of excessive power, lack of accountability and representation, indifference towards public needs and demands, official secrecy and inaccessibility, and role in depoliticizing the public sphere" (Ayee 2008: 1). The problem is to determine the capacity of SERVICOM in the case of Nigeria to reformatively transform the traditional, protectionist, rent-seeking, inefficient public service sector to the new public service system. How would SERVICOM scale up and measure customer service in terms of timeliness, right attitude, quality of service, service outcomes, and customer satisfaction? What is the capacity of SERVICOM to initiate and execute sustainable targets in the Nigerian public sector? The study evaluates SERVICOM to determine (a) its capacity to establish service ethics, (b) ensure procedural standards (c) enhance compliance outcome in terms of general customer satisfaction indices, (d) determine and resolve what changes are needed to realize its set objectives, and (e) assess the effectiveness of SERVICOM in public service. FETHA is selected because of its critical impact in the health economy of Ebonyi State and the later as one of the frontline economic states in the south-east geopolitical zone of Nigeria. Specifically, the study will through data analysis of the critical issues stated earlier determine (a) the knowledge of FETHA staff about SERVICOM services; (b) attitude of FETHA staff toward SERVICOM services; (c) quality of services provided by SERVICOM; (d) the extent SERVICOM has transformed public sector governance in Federal Teaching Hospital, Abakaliki; (e) the issues and challenges militating against effective, efficient, and accountable service delivery in FETHA, Nigeria.

## State of Public Service in Nigeria Before SERVICOM

In Nigeria, public service administration has a long British colonial origin. It is one of the structured legacies of the British colonial administration in Nigeria. Over time, this historical bureaucratic tradition of seeming meritocracy, nonpartisanship, and patriotic service became unruly political, unpatriotic, and subverted by cronyism, impunity, redundancy, and condonation especially from the 1980s military regimes to the new millennium. In fact, El-Rufai (2011: 1, 4) argues that:

> It is both a truism that no nation develops beyond the capacity of its public service, and there is broad consensus amongst Nigerians that our public service is broken and dysfunctional. The quality of public servants and the services they provide to our nation are both below expectations. From the glorious days at independence when the best and brightest graduates competed to join the administrative service up until 1970s, our public service is now seen as employer of the dull, the lazy and the venal. We need to retrieve our old public service – effective, well paid and largely meritocratic, attracting bright people imbibed with a spirit of promoting public good. . . .It is therefore uncontestable that the public service became dysfunctional following years of neglect and failure to reform. The public service was both large and unwieldy, accountability was weak and professional standards low.

Nigeria public service experienced inverse rather than progressive development. There was speedy retraction, reversion, and retrogression of the gains of Nigeria's democratic struggles. Nigeria political dispensation from 1999 to 2003 in the post-military era was characteristically unstable. Al-Gazali (2011) observed that maintaining and sustaining over 400 federal government service agencies and still counting were problematic and a major source of waste of public funds. Okonjo and Osafo (2007) corroborated the dysfunctional nature of Nigeria public service insisting that about 70% of federal civil servants had a high school diploma or lower, with less than 5% possessing modern computer skills. El-Rufai underscored the findings of the Public Service Reform Team (PSRT) to include rapidly aging public service, untrained and largely undereducated labor force, with over 60% being over 40 years, less than 12% with university degrees or equivalent, over 70% were of the junior grades (levels 01–06), and about 20% were "ghost

workers" – nonexistent people on the payroll which goes to staff of personnel and accounts departments El-Rufai (2011: 2). The consequences of the state and image of Nigerian public service are serious and multiple. The overall competence level is negatively affected; operationalization of service charter is problematic in most public establishments, while professionalization becomes excessively difficult. All these cumulatively affect the quality and quantity of services and contribute to inefficiency and ineffectiveness in the overall production value chain. However, the need to reform public management in Nigeria became obvious in view of the inextricable link between public service and national development. Nigerian government at different times and years embarked on several public/civil service reforms to revamp the service and gain public trust. Some of these reform efforts include the Tudor Davis Commission of 1945–1946, the Morgan Commission of 1963 which extensively revised staff salaries and introduced the minimum wage policy, Simeon Adebo (1971), Jerome Udoji (1972), Dotun Philips (1986), and the Allison Ayida Panel (1995), Oransanye Committee (1998), the Bureau of Public Service Reforms (BPSR) 2003, Nasir Ahmad El-Rufai Public Service Reform Team (2005–2007), inter alia El-Rufai (2011: 4). Therefore, Nigeria public service was more of a shadow and pariah public service than a responsive, popular, and professional service. This is the raison d'être for the establishment of SERVICOM Act of 2004.

## The Nigeria Service Compact in Pursuit of Good Governance

In Nigeria as in most African countries with traditional public service system, public service is the engine and clearing house of all government businesses and national development. According to Nigerian Communication Commission (NCC): "SERVICOM is about service. Public service is the only contact that most people have with Government; SERVICOM focuses on the quality of that contact or the lack of it. . . ." (NCC 2015) Government by this singular act executes its contractual willingness to serve the people while inculcating in the people the right to demand and insist on quality in quantity, timely, fair, and accountable services across all cadres of public sector organizations. This is planned to create a reformative-transformative service culture that is analogous with what Robert Denhardt calls the new public service that recognizes the democratic citizen as "customer" of government deserving accountability, integrity, and honest service; that ensures the deepening of unity and community of civil societies and organizational humanism (Denhardt and Denhardt 2000); and that pursues and ensures the timely provision of total quality services in public management and overall sound governance procedures.

Operationally, SERVICOM is responsible for coordinating the development of service charters for all government offices, monitoring the implementation of the charters, and evaluating the performance of government ministries and departments in terms of targeted results on services. SERVICOM Act is designed to identify, measure, and execute right processes and systems in governance that deliver quantifiable quality services to citizens and residents of Nigeria. It reports back to the Federal Executive Council (FEC) through the Office of the Secretary to the Government of the Federation (OSGF) (Obriki 2015: 1) on the performance, obstacles, and milestones. Obriki argues that the acquisition of proper skills and knowledge through training remarkably improves staff capacity and capability to achieve positive outcomes in critical conditions. He identifies the key challenges that impede the success of different reforms carried out by SERVICOM to include (a) lack of guaranteed continuous funding, (b) lack of commitment from political leadership, (c) lack of adequate numbers of senior level civil servants with sufficient capacity to drive the reform, (d) lack of accountability on the part of senior civil servants, (e) weak information system, and (f) general poor perception about SERVICOM (Obriki 2015: 9–10). In fact, basic facts about SERVICOM in relation to public services in Nigeria are expressed in the Special: Introduction to SERVICOM.

Martin Duggan (2008) argues for transforming government services from the pervasive

organizational programmatic model to citizen-centric service model that is currently shaping the political economy of leading world economies. He defined citizen-centric service model as "basing services on citizen needs rather than on organizational requirements. . . .Citizen-centered service also means putting a focus on exceptional service delivery and making the receipt of services as easy as possible for the citizen" (Duggan and Green 2008: 5–12). In the United States, the GPRA Modernization Act of 2010 (Government Performance and Result revised Act) is a strategic plan of the government to enhance and improve public governance, performance, planning, and results while publicly reporting and analyzing gaps and anticipated milestones of set targets. Similarly, customer satisfaction is the vision of Singapore's iGov 2010 strategy, which declares that "Greater emphasis will be placed on gaining insights into customers' needs and preferences" this will enable government to clearly "anticipate their needs and deliver proactive, responsive e-services, through their preferred electronic channels" (Duggan and Green 2008: 12). Such collaborative and integrated public service structure requires a revolutionary shift from the old, traditional, state-centric model to new public management characterized by leaner, entrepreneurial, and increasingly privatized governance (Denhardt and Denhardt 2000). Noting the sharp service differential in Nigeria's public services, President Obasanjo (2003) opines that governance in public sector organizations should be politically neutral, impartial, transparent, and accountable. After all, the state is constituted essentially to serve public interest in the provision of political goods and services.

## The Public Service Performance Challenges: Implication for SERVICOM

Despite the efforts of SERVICOM to reform and promote the value chain of Nigeria public service, there are strong barriers undermining the gains of the public service reform. They include "fear of blackmail and physical attack ($t = 3.744$; $p < 0.05$); fear of reprisal ($t = 2.156$; $p < 0.05$); tribalism and nepotism ($t = 2.884$; $p < 0.05$); leniency ($t = 4.835$; $p < 0.05$); bribery ($t = 3.509$; $p < 0.05$); admiration of personal loyalty more than job performance/output ($t = 3.453$; $p < 0.05$)..." Ijewereme and Benson (2013: 130). Other factors critical to organizational performance and result include employers' oversight capability, attitude, lateness, employers' unsavory comments, poor method of on-the-job training, erratic provision of services, careless and casual handling of job equipment and machines, nonchalant attitude, and lack of dedication to duty (Wasilu 2013). DeSimione and Harris contend that internal factors such as motivation, ability, attitude, knowledge, and skills are essential in determining service productivity outcomes. Attitude is all about a person's way of behaving, acting, working, thinking, or relating with others in a workplace. Positive attitude attracts and enhances teamwork, collaboration, collegiality, and organizational higher performance. It is the "bedrock and foundation toward higher performance in established settings. It is an investment as well as resource that can be used to achieve a higher profit, good reputation and overall organizational goals." Poor attitude conversely negates, thwarts, and retards organizational outcomes and could lead to poor discernment, job dissatisfaction, conflict, and a chain of negative attitudes in an organization (Wasilu 2013).

Furthermore, public management in most developing countries of the sub-Saharan states of Africa has been negatively impacted by the syndrome of what Grindle refers to as "too much state" which makes governance and public administration in such states "far too extensive, intrusive, expensive and inefficient" (Larbi 1999: 8). In most of such instances, public management becomes grossly inefficient, chronically exploitative, and corrupt and overwhelmed by policy reversals, poor services, and high transaction and operational costs. The situation clearly diverts the task of public governance to reducing public expenditure deficits, downsizing of labor force, servicing of debt overhangs, tax and public service reforms, and review of subsidies and economic policies (Larbi 1999). These barriers challenge the competence and capacity of SERVICOM to ably transform and standardize Nigeria public service system. To check these

challenges require regular performance and improvement appraisals, maintenance of due process, and diligence, strong political will to fund and implement reform programs, assessments of barriers, and consolidate evidential gains.

### Evaluating Service Performance in FETHA, Nigeria

The history of Federal Teaching Hospital, Abakaliki (FETHA), started in the 1930s under the British colonial administration. At onset, it was named Casualty Control Centre where the World War II soldiers and belligerents were treated. Gradually it gained greater recognition of the Eastern Regional government and was later taken over by the government of the East Central States (Ogochukwu Anioke, *The Nations*, 2015). By 1973, the hospital was approved for training of house officers but was seriously affected by political turbulence of military coups and counter coups in Nigeria from the 1970s to the 1980s that it became virtually moribund. In the 1990s, the federal government in pursuit of its bilateral public policy agreement with Enugu State government of Nigeria converted and upgraded the hospital from State General Hospital to Federal Medical Centre (FMC). From 2007 the new administration of Olisaemeka Ezeonu made unprecedented progress in the development and management of the hospital; outpatients grew progressively to over 5000 monthly, and accreditations of various departments were restored. On December 7, 2007, federal government merged the Federal Medical Centre and the Ebonyi State University Teaching Hospital to form the new Federal Teaching Hospital, Abakaliki (FETHA), commissioned in 2011. The modern FETHA complex has a workforce of over 4000 staff comprising over 200 consultants in various specialties, 100 house officers, 78 registrars, 85 senior house officers, 300 nurses, 500 health attendants, 120 community health extension workers, 90 pharmacists, 150 medical laboratory scientists/technicians, 602 bedded ward complex, and 500 resident doctors with training capacity of about 250 house officers annually inter alia. According to Olisaemeka Ezeonu, the chief medical director of the hospital, "new multipurpose hospital complex is designed as a one-stop complex to accommodate various units in the departments of Paediatrics, Obstetrics and Gynaecology; administration department comprising consulting rooms and wards among others" (Ogochukwu Anioke, *The Nations*, 2015). With the growth of health facilities in the state, the need for increased service delivery led to the establishment of SERVICOM in FETHA.

FETHA-SERVICOM, as service compliant and improvement agency, introduced series of citizen-centric and citizen-driven service reforms to march and maximize service delivery and customer satisfaction and improve workers attitude, efficiency, timeliness, responsiveness, and accountability while increasing equal and equitable access to government services, businesses, and products in the hospital. It also established more communication channels for service complaints, discipline, and diligence among staff, embarked on regular spot checks and compliance tests, strove toward maintaining standard code of conduct and dressing among staff and improved the quality of service to hospital inpatients and outpatients and general working environment of FETHA medical, paramedical, and administrative staff. Despite these notable improvement recorded by FETHA-SERVICOM, its main challenges remain protractedly poor and untimely public funding of its services, reform programs, communication costs, and working conditions. The continued relevance of SERVICOM in FETHA was therefore assessed on the randomized questionnaire administered among FETHA staff and patients using carefully applied methodology.

## Methodology

Methodology explains the approach or scientific way of conducting and presenting scientific investigation. The approach provides the logical and empirical design of the discourse. In dealing with the critical issues of service in Nigeria-Africa, the approach shall be critical, empirical, and objective.

The structured approach includes the evaluation of primary and secondary sources.

**Service: The Matrix of Good Governance in Nigeria-Africa, Table 1** Demographics of participants

| Characteristics | | Frequency | Percentage (%) |
|---|---|---|---|
| Sex | Male | 129 | (34.1) |
| | Female | 249 | (65.9) |
| Age | 20–30 | 147 | (39) |
| | 31–40 | 177 | (47) |
| | 41–50 | 42 | (11.2) |
| | 51–60 | 9 | (2.4) |
| | >60 | 3 | (0.8) |
| Profession | Doctor | 12 | (3.2) |
| | Pharmacist | 6 | (1.6) |
| | Nurse | 36 | (9.5) |
| | Med lab scientist | 60 | (15.9) |
| | Admin staff | 135 | (35.7) |
| | Others | 129 | (34.1) |
| Years of experience | 0–5 years | 210 | (55.6) |
| | >5 years | 168 | (44.4) |

Primary data are sourced using structured questionnaire designed by authors, while the results generated are analyzed using software Statistical Package for the Social Sciences (SPSS) version 20.0 for the calculation of mean, frequencies, and percentages. The demographic data contain information on basic demographic characteristics such as sex, age, profession, and years of experience (Table 1). Each item is scored on a five-point Likert scale ordinal response: Strongly Agree = 5 points, Agree = 4 points, Neutral = 3 points, Disagree = 2 points, and Strongly Disagree = 1 point. The percentages of respondents that chose a particular score are also determined. Although the study has a sample size of 500, the analysis is however based on returned 378 respondents questionnaires spread across the various demographic indices as noted in Table 1. The secondary data involve the content analysis of variety of academic journals, publications, periodicals, and relevant texts. The aim is to obtain sufficient material necessary for data formulation, comparison, and evaluation of facts, to expand the necessary theoretical base, and to avoid poor and untenable assumptions.

The final approach is the evaluation of critical sectors using basic assessment techniques and cross tabs to effectively discuss the results and research findings. In the study, cross tabs display the joint distribution of two study variables to enable reasoned comparison. Comparison is between professional category of FETHA staff and their knowledge, attitude, and quality of service, respectively. FETHA staff are grouped into doctors, pharmacists, nurses, medical lab scientists, administrative staff, and others. Also years of experience of the participants and their knowledge, attitude, and service, respectively, were compared and classified into two major groups: those with less than or equal to 5 years experience (0–5 years experience) and those with greater than 5 years experience (>5 years experience). The percentage satisfactory scores for knowledge, attitude, and quality of service are determined by obtaining the percentage of all participants that "strongly agreed" and "agreed" to items on the questionnaire. A score of less than 50% is regarded as poor and unsatisfactory, a score of 50% is regarded as being on the border line, while a score that is greater than 50% is regarded as good/satisfactory. Barriers militating against effective service delivery in FETHA are also analyzed. The overall method of analysis shall be critical and based on rational justification of facts as expressed in the discussion of research results and findings.

## Results and Discussion

### Results

Table 1 shows that male participants were 34.1% while 65.9% of the participants were females. The age of 47% of the participants ranged from 31 to 40 years. The administrative staff who participated in the study were 35.7%, and 55.6% of the participants had 0–5years experience. Table 2 shows that 41.3% of the participants strongly agreed or agreed that there is high level of literacy/awareness of SERVICOM unit among in-/outgoing patients in FETHA, while about 81.7% insist that cordial relationship between patients and staff is vital for SERVICOM efficiency. 61.9% strongly agreed or agreed that SERVICOM motivates employees to be

**Service: The Matrix of Good Governance in Nigeria-Africa, Table 2** Responses of participants to identified issues as regards SERVICOM

| No. | Item | Mean ± SD | Frequency(%) Agreed/Strongly Agreed |
|---|---|---|---|
| 1 | There is high level of literacy/awareness of SERVICOM unit among in-/outgoing patients in FETHA | 2.94 ± 1.31 | 156(41.3) |
| 2 | Poor funding affects SERVICOM unit in FETHA, Ebonyi State | 2.77 ± 1.44 | 135 (35.7) |
| 3 | The main cause of low productivity in FETHA has been poor managerial style | 3.84 ± 1.24 | 270 (71.4) |
| 4 | Cordial relationship between patients and staff is vital for SERVICOM efficiency | 3.82 ± 1.12 | 309 (81.7) |
| 5 | Staff productivity is vital for organizational growth and development in FETHA | 4.60 ± 0.55 | 369 (97.6) |
| 6 | SERVICOM motivates employees to be effective and efficient in FETHA | 3.43 ± 1.41 | 234 (61.9) |
| 7 | There is constant training of SERVICOM staff in FETHA | 2.33 ± 1.12 | 291 (77.0) |
| 8 | The existence of SERVICOM in FETHA has had a positive significant impact on the staff service delivery | 3.36 ± 1.38 | 228 (60.3) |
| 9 | The presence of SERVICOM in FETHA has had a positive significant impact on the patients | 3.14 ± 1.35 | 186 (49.2) |
| 10 | SERVICOM unit has been able to train and engineer all categories of staff to their rights and responsibilities in the hospital | 2.67 ± 1.31 | 111 (29.4) |
| 11 | The performance of SERVICOM unit has been efficient and effective in FETHA | 2.87 ± 1.25 | 156 (41.3) |
| 12 | SERVICOM has improved on the development of hospital by ensuring an orderly, responsible, and disciplined staff where core values of ethics, honesty, and hard work have been demonstrated | 2.94 ± 1.26 | 147 (38.9) |
| 13 | SERVICOM unit is efficient and effective in achieving patients' satisfaction | 3.17 ± 1.31 | 213 (56.3) |
| 14 | Lack of proper funding has limited the full operations of SERVICOM unit in FETHA | 2.83 ± 1.34 | 114 (30.2) |
| 15 | The management problems of the SERVICOM unit have positively influenced its effective service delivery in FETHA | 1.11 ± 1.11 | 144 (38.1) |
| 16 | There is proper organizational communication among SERVICOM staff in FETHA | 1.22 ± 1.22 | 168 (44.4) |
| 17 | SERVICOM unit has transformed FETHA public sector governance by ensuring a conducive hospital environment | 2.67 ± 1.30 | 129 (34.1) |
| 18 | There is high level of dissatisfaction among patients with hospital bureaucratic structure in FETHA | 3.14 ± 1.40 | 162 (42.9) |
| 19 | Time consciousness, delayed service delivery, and accessibility are a challenge in FETHA | 3.83 ± 1.28 | 264 (69.8) |
| 20 | Lack of functional medical machines/equipment and infrastructural facilities poses a serious challenge to service delivery in FETHA. | 3.95 ± 1.28 | 279 (73.8) |
| 21 | Service delivery has improved significantly in FETHA since the inception of SERVICOM | 2.79 ± 1.36 | 147 (38.9) |
| 22 | There is effective interdepartmental relations for effective service delivery | 3.32 ± 1.49 | 192 (50.8) |
| 23 | Customer satisfaction is key to service delivery in FETHA | 4.10 ± 1.30 | 312 (82.5) |

effective and efficient in FETHA. However, 38.9% strongly agreed or agreed that service delivery has improved significantly in FETHA since the inception of SERVICOM.

Table 3 displays results of analysis of FETHA staff's knowledge (profession category). The mean knowledge score in this category was 66.1%. Doctors had the modal score

| | | **Mean** | | | | | | 62.6 |

of 87.5%, while the pharmacists had the lowest score (50%).

Table 4 shows the result for analysis of FETHA staff's attitude toward SERVICOM (profession category). The mean attitude score was 62.6%. The doctors also had the modal score of 83.3%, while the medical lab scientists had an attitude score of 52.5% and was the lowest score. The mean quality of service score was 38.9%. The doctors had the highest score (47.2%), while the pharmacists had the least score (27.8%) as displayed on Table 5.

Table 6 shows the result of the analysis of FETHA staff's knowledge of SERVICOM (years of experience category). Staff with less than or equal to 5 years experience was 61.4%, while those with greater than 5 years experience had a score of 63.4%. The mean knowledge score was 62.4%. Table 7 displays result for analysis of FETHA staff's attitude toward SERVICOM (years of experience category). The mean attitude score was 60.5%. Staff with less than or equal to 5 years experience scored 61.4%, while staff with greater than 5 years experience had a score of 59.5%. Table 8 displays result for analysis of quality of service offered by FETHA staff (years of experience category). The mean quality of service score was 40.1%. Staff with less than or equal to 5 years experience scored 40.5%, while staff with greater than 5 years experience had a score of 39.6%.

Figure 1 displayed the percentage of respondents that "agreed" or "strongly agreed" to specific barriers were 35.7% (poor funding), 71.4% (poor managerial style), 69.8% (time and accessibility), and 73.8% (lack of functional machines/equipment/infrastructure).

## Discussion

The results indicate that majority of the participants were females. Less than half (41.3%) of respondents concurred to high level of literacy and awareness of SERVICOM interventions and services in FETHA, while about 81.7% insist that

cordial relationship between patients and staff is vital for service/SERVICOM efficiency. The results demonstrate the need for SERVICOM to promote patient-staff relationship and increase platforms for interdepartmental collegiality, collaboration, and community. SERVICOM should

**Service: The Matrix of Good Governance in Nigeria-Africa, Fig. 1** Barriers militating against effective service delivery in FETHA

also increase access for staff to participate actively in targeted resource programs, motivation, and capacity building initiatives.

On knowledge and attitude, more than half of the FETHA staff (doctors, pharmacists, nurses, medical lab scientists, administrative staff, and others) had satisfactory knowledge and attitude toward SERVICOM in FETHA (66.1% and 62.6%, respectively), while less than half of the staff (38.9%) "agreed" or "strongly agreed" that the quality of service offered by SERVICOM was satisfactory. This indicates that in general, all the professionals in FETHA had good knowledge and attitude toward SERVICOM but disagreed on the quality of services provided by SERVICOM. This implicates the effectiveness and efficiency of Nigeria Service Act as institutionally enforced by SERVICOM. Participants did not agree that SERVICOM ensured quality service in FETHA. The results demonstrate that SERVICOM staff are not significantly effective in the overall conduct of their day-to-day activities which generated occasional and interoperation lapses in FETHA services. Sectorally, the doctors as the heads of the hospital management and practice had the highest score on the knowledge, attitude, and quality of service section (87.5%, 83.3%, and 47.2%). The result indicates that more doctors had satisfactory knowledge and attitude toward SERVICOM when compared with the pharmacists, nurses, medical lab scientists, administrative staff, and other staff of the hospital. It indicates that more doctors believed that SERVICOM offered quality services when compared with other staff of the hospital. Half of the pharmacists (50%) and less than half of them (27.8%) had satisfactory scores in the knowledge and quality of service section, respectively. The scores were lowest compared to other FETHA staff. In addition, about half of the medical lab scientists (52.5%) had satisfactory scores in the attitude section which was also the lowest score among that of other professionals.

On barrier assessment, more than 50% of the respondents believed that poor managerial style, time and accessibility, lack of functional machines/equipment, and poor infrastructure were barriers. However, less than half of the respondents agreed that poor funding was a barrier. The respondents' results perceive SERVICOM as adequately funded but impeded by bureaucratic and managerial corruption which has steadily eroded the gains of good governance, policy implementation, and service outcomes. Unlike our finding in FETHA Ebonyi State, a similar SERVICOM-based study carried out in the Federal Capital Territory, Abuja, implicated inadequate funding as a major challenge to the provision, practice, and effectiveness of SERVICOM goods and services (Adeyinka and Omonowa 2015). The indication is general funding irregularity which directly affects service outcomes in public sector organization. Overall, findings from both profession and years of experience categories demonstrate that mean knowledge and mean attitude scores were more

than 50% while the mean quality of service score was less than 50%. Hence, FETHA staff's knowledge and attitude were satisfactory, while quality of service offered by SERVICOM was poor. The results demonstrate that the presence of SERVICOM has not generally transformed service efficiency and quality service in FETHA.

On the whole, the knowledge of the pharmacists is at a border line level and needs to be improved upon. SERVICOM should increase resource development platforms especially for pharmacists and also for medical laboratory scientists (with borderline attitude score) because more capacity building programs influence workers' general attitude in workplaces. This is necessary to ensure total quality service for staff and professionals since both professionals are critical stakeholders in hospital management and practice. The analysis of responses of FETHA staff with less than or equal to 5 years experience and those with greater than 5 years experience revealed that the former had greater knowledge and quality of service scores. This indicates that SERVICOM activities are concentrated more on low-middle-income earners with less impact on top/managerial cadre. Greater attitude scores were also observed among those with less than or equal to 5 years experience. This infers that top cadre staff believe so much in SERVICOM despite the obvious poor performance. In addition, the quality of service scores for all FETHA staff which comprise of staff with less than or equal to 5 years experience and those with greater than 5 years experience were unsatisfactory. The results demonstrate that despite the modest improvement recorded by SERVICOM, there is still more room for improvement in the quality of service and staff compliance to work ethics and knowledge.

The study strongly argues that SERVICOM and Nigerian Service Act do not have maximum capacity and capability to drive efficiency, compliance, and good governance. This creates interoperation gaps and lapses in the bureaucratic value chain. There is need to institute measurable interoperation strategies to improve organizational competence. This will enhance quality standard operating procedures, appraisal systems, and organizational rating. At present, SERVICOM appears foundationally ill-equipped to tackle the onerous task of public service rot in Nigeria. Therefore, the reformative transformation of Nigeria public services should obviously begin with the revision of the SERVICOM Act to withstand millennial challenges and ensure effective monitoring and evaluation processes in all public sector organizations, ministries, departments, agencies, and parastatals.

## Measuring the Outcomes of Nigeria Service Compact

1. The study observed that SERVICOM as constituted does not have sufficient capacity to initiate, measure, and execute right processes in the public service; it does not have maximum, independent capacity and capability to set and drive goals, measure performance against the goals, coordinate, enforce compliance, and service accountability based on results.
2. Based on the results, there should be well planned and targeted capacity building measures and system checks mechanism to maintain, upgrade, and sustain standard operating and improvement procedures. Good and/or sound governance best practices should be adopted to ensure functional institutional- and interdepartmental-based support systems, public accountability, responsiveness, and transparent interoperability procedures.
3. Based on study, the government should provide sufficient e-service platforms powered by strong ethical standards to guide procedures and ensure measurable outcomes.
4. Finally, the necessity for creating adequate system synergy is critical especially at the senior management cadre. The study found out that execution of SERVICOM charter by ministers, decision-makers, and political appointees was most of the times politicized, inconsistent, and difficult. The situation could

encourage political impunity and compromise which undermine the very essence of the Public Service Act.

## Conclusion

The results to a large extent confirm that FETHA-SERVICOM has lots of challenges, barriers, and milestones that influence its operational capacity. There are still huge gaps for improvement especially in the areas of bureaucracy, e-services, human capital, service efficiency and effectiveness, measuring targets, social responsibility, good governance, and, to a larger extent, funding. The government at all levels should demonstrate sufficient political will to support SERVICOM to reform and transform Nigeria's public service organizations in line with international best practices. The study infers that the establishment of Nigeria Service Act as service-compliant institution is proactive and has good governance initiative. It should not be politicized but be made technically competent to provide responsive popular services to achieve sustainable outcomes and customer satisfaction.

Considering the overall performance of SERVICOM in the context of Nigeria-Africa, torn by zones of political conflicts and apolitical leadership, the study concludes that service remains not only the foundation but the galvanizing matrix of sound governance. Unfortunately, the potentials are highly challenged by the intertwining political, economic, sociocultural, and environmental problems in most African states. Service across African world is undeniably poor and in dire need of reform. Nigeria undoubtedly is the heart Africa; what affects Nigeria directly affects Africa. The consequences of more than four decades of public service decadence are fatal and multifarious, that is, a failed public service in Nigeria has untold consequences for the region. Therefore, system reform is inevitable but has to be gradual and consistent (if not ambitious) to restore public trust, regional growth, and confidence and provide much desired political direction for participatory citizenship and impartial and responsive e-services. Noting the criticality of patriotic service, President Bush in his inaugural address enjoins his compatriots: "What you do is as important as anything government does. I ask you to seek a common good beyond your comfort; to defend needed reforms against easy attacks; to serve your nation, beginning with your neighbor. I ask you to be citizens: citizens, not spectators; citizens, not subjects; responsible citizens, building communities of service and a nation of character" (Microsoft Encarta 2009). This is an incumbent task for Nigeria and entire African nations and peoples.

# Sexual Harassment Law and Policy

Charu Sharma
Center for Environmental Law and Climate Change, Jindal Global Law School, O P Jindal Global University, Sonipat, Haryana, India

## Synonyms

Groping; Quid pro quo sexual favors; Sexual assault; Sexual discrimination; Sexual humiliation at work; Sexual intimidation; Sexual offense/harassment; Sexually hostile work environment; Unwanted sexual touching

## Definition

The International Labour Organization defines sexual harassment as a sex-based behavior that is unwelcome and offensive to its recipient. It is an unwanted sexual advance or an unwelcome conduct or request for sexual favor especially at the workplace and includes sexual conduct in which a reasonable person would have anticipated that the victim would be offended, humiliated, or intimidated or the person, alone or together with other persons, engages in conduct of a sexual nature which creates a hostile or intimidating environment for the victim. Thus it is characterized in two forms largely: sexually hostile work environment in which the conduct creates conditions that are intimidating or humiliating for the victim and quid pro quo sexual harassment, when a job prospect – getting a job, career advancement, promotion, pay rise, annual report submission by supervisor, and renewal of contract – is conditional upon the victim consenting to sexual demands/favors at the workplace.

### Introduction

Sexual harassment is recognized both a crime and a civil wrong in most jurisdictions across the world. It remains a pervasive problem, especially at the workplace and within employment

situations. It affects the victim of acute sexual harassment to manifold traumas both physically and mentally (Thacker and Gohmann 1996). Within the workforce, a victim of sexual harassment may suffer from low esteem, psychological damage, low efficiency at work, and low morale. Human resources and management offices of companies where such conduct is pervasive face a huge problem of employee absenteeism, hostile workers, and staggering lawsuits and legal battles for settling claims, not to mention the ill repute it carries that is associated with the good will and company name. Thus workplace sexual harassment is a burden and imposes heavy costs on the employer (Srivastava and Sharma 2000). Sexually hostile workplace leads to decrease in productivity, lack of team work, higher workplace accidents, and loss of valuable workers (Rubenstein 1992). Employers end up losing profitable contracts, clients, and reputation.

In addition, policy documents and legislation internationally recognize that sexual harassment is also a form of discrimination, as allowing it to continue risks many women being reluctant to take up traditionally male jobs or jobs in a largely male workforce. Women's equal opportunities are undermined when they are dissuaded from applying for higher paying jobs, which have been traditionally male. Overall the employers bear a heavy burden in allowing sexual harassment to continue or when they fail to take active measures to abate or put in place better practices against sexual harassment at the workplace (Sharma 2010). The following paragraphs highlight the legal status of sexual harassment in Hong Kong and China. In both jurisdictions employers are paying huge costs for such conduct.

In Hong Kong in May 2014, a *Questionnaire Survey for Workers of Service Industries* announced by the Equal Opportunities Commission reveals that almost one-fifth or 19% of the responding service industry workers alleged they had been sexually harassed at work in the last 12 months. In 2015, a fireman alleged extreme form of sexual harassment and assault by eight of his colleagues when he was forced to remove his pants and perform self-stimulation, which conduct was then reported to the police to investigate leaving the victim depressed turning to suicidal thoughts. In 2016, the Performing Arts Society and the School of Drama in Hong Kong had to pay one million dollars to an employee victim of unlawful vilification and termination of contract after he complained of the institution dean's alleged sexual harassment against students. The authorities in China provide similar or higher figures. A study conducted by the Chinese Academy of Social Sciences indicated that almost 40% of women who are working with either private companies or companies with foreign funding had been sexually harassed. Seventy percent of female factory workers who answered a survey conducted by the director of the Guangdong-based nonprofit Sunflower Women Workers Center in fall 2013 said they had experienced some form of workplace sexual harassment. One in four said they had received obscene phone calls or pornographic messages, almost one in ten reported having been directly propositioned for sex at work, and 15% had quit their jobs because of unwanted sexual attention that neither factory management nor police ventured to stop (Bloomberg News, Sexual Harassment of Female Factory Workers in the PRC 2013).

## The Legal Status

In both Hong Kong and China, sexual harassment has been declared a tort and a civil wrong, respectively. It was dealt with as a crime earlier in China. Law on the protection of Women's Rights and Interests was adopted at the fifth session of the seventh National People's Congress of the People's Republic of China on April 3, 1992, amended at the 17th session of the Standing Committee of the 10th National People's Congress on August 28, 2005, especially articles 57, 58, and 59. It has been declared a tort under legislation in Hong Kong under the Sex Discrimination Ordinance (Cap. 480, SDO) in 1996. SDO thus declares sexual harassment as a prohibited conduct for which the remedy, inter alia, is award of compensation to the victim. This award by the court includes compensatory, aggravated, exemplary, and punitive damages (Srivastava and Sharma 2000). Both jurisdictions have legislated laws including and recognizing workplace sexual

harassment as defined by the ILO Declaration on Fundamental Principles and Rights at Work and the International Convention on Elimination on All Forms of Discrimination Against Women (CEDAW) (Sharma 2010; ILO 2010).

*Definition* of sexual harassment under the Hong Kong (Sex Discrimination Ordinance, Cap 480, (hereinafter SDO):

Under the provisions of the SDO, a person, a man or a woman, may be legally liable for sexual harassment when "a person sexually harasses a woman/man (victim) if the person makes an unwelcome sexual advance, or an unwelcome request for sexual favors, to the victim or engages in other unwelcome conduct of a sexual nature in relation to the victim, in circumstances in which a reasonable person would have anticipated that the victim would be offended, humiliated or intimidated, or the person, alone or together with other persons, engages in conduct of a sexual nature which creates a hostile or intimidating environment for the victim" (Section 2(5), SDO). A conduct of a sexual nature "includes making a written or verbal statement of a sexual nature to the victim, or in her/his presence" (Section 2(7)). Thus direct and indirect sexual harassment is prohibited by the SDO.

### Conduct Recognized as Sexual Harassment

Instances of conduct that human resources management and employers need to be aware of provided in the Code of Practice (COP) issued by the Hong Kong Equal Opportunities Commission include, among others, touching, grabbing, or deliberate brushing up against the victim and persistent questioning about the victim's sex life; making a written or verbal statement of a sexual nature to the victim or, in her/his presence, making crude jokes or lewd remarks and sexual comments to an employee; demanding for sexual favors at work by a supervisor, employer, or between employees; inappropriate touching of an employee, prospective employee, customer, or prospective customer, flight attendant add or is a service provider in hospital industry; and sexual intimidation and humiliation for gaining employment or advancement in career within employment situation all fall under the definition of SDO Hong Kong Equal Opportunities (2010). Men and women working in the sector of direct sales of goods and services, especially in the course of providing goods, facilities, or services to the customer, have also been covered under a recent amendment in the SDO in 2014 (amended Section 40).

The amendment extends to people working on local ships or aircraft outside HK.

### Scope and Prohibition

Earlier the scope of prohibition of sexual harassment included educational establishments, government institutions, and all workplaces including clubs, restaurants, solicitors' and barristers' chambers, accounting offices, and those providing limited services. However, the amendment in 2014 prohibits sexual harassment by customers or prospective customers toward the providers of goods, facilities, or services and their employees.

### Protection of Employees Within the Service Industry

The stipulations under the law as provided by Section 40 earlier did not cover situations where an employee or service provider was outside Hong Kong or upon international air space or waters. Under the recent amendment, "it is unlawful for a person to sexually harass a woman (or a man) in the course of seeking to be provided with goods, facilities or services by her/him, or being provided with goods, facilities or service by her (or him)." Accordingly prospective customers and/or customers are prohibited from sexually harassing the providers of goods, facilities, or services. The provisions under the SDO specifically stipulate that such prohibition is applicable even if the sexual harassment occurs on a Hong Kong-registered ship or aircraft outside Hong Kong. This provision protects stewards, flight attendants, and crew members of ships/vessels as they may be sexually harassed while on duty on a ship or a plane or aircrafts or ships outside Hong Kong.

The new amendment to the SDO furthers the protection toward employees who have frequent contact with customers and prospective customers.

### Course of Employment, Vicarious Liability for Employers, and Significant Cases Within the Courts

Recognition of sexual harassment as a prohibited conduct within the workplace as a matter of policy and law becomes significant for employers as it makes the employer liable for the tort of sexual harassment whether perpetrated by the employer, supervisor, immediate supervisor, an employee, or a prospective employee making the company or the employer vicariously liable to pay compensation for the tort committed during the course of employment by the wrong doer. The law thus gives an extended definition of the course of employment, and an employer/company is vicariously liable if unable to show that it had taken reasonable steps to promote a safe working environment and adopt a Code of Practice issued by the Equal Opportunities Commission (Srivastava 2001). In such circumstances, upon complaint and positive findings of complaint by the victim law regards both the employer and the employee as joint tortfeasors (wrong doers). A complainant or victim of sexual harassment may then bring a suit against the employer who is usually sued and called upon to pay for the employee's wrong. The employer is liable not only to a third person but is also liable to another employee who has been subjected to sexual harassment. Section 46 provides that anything done by a person in the course of his/her employment shall be treated as done by his/her employer as well as by him/her, whether or not it was done with the employer's knowledge or approval. The SDO reflects many provisions that have been drawn from the Canadian Sexual Harassment Act and the Australian Commonwealth Sex Discrimination Act and other State legislation (Srivastava 2001; Sharma 2010). Apart from the award of compensation by the court, other relief measures under the law empower the court to punish the wrongdoer and grant any relief or make orders which are necessary and expedient to do justice to a victim, including the granting of appropriate equitable remedies.

### Statutory Body Under the SDO

The Hong Kong Equal Opportunities Commission (EOC) a statutory body was created under the SDO to deal with resolution of sexual harassment complaints within employment situation. The EOC also investigates and addresses amicable settlement of sexual harassment complaints. The EOC had issued a Code of Practice on Employment (the Code) in 1999. The Code recommends that the employers should take steps as are reasonably practicable to eliminate all forms of sexual harassment in the workplace. It recommends that employers should issue a policy statement expressly stating that sexual harassment at work is unlawful and will not be permitted and employees have a right to complain should it occur.

### Legal and Social Difficulties for a Sexual Harassment Victim

A victim faces many legal difficulties as well as social ones if she or he identifies the harasser and makes a complaint. The legal difficulties include proving sexual harassment, i.e., civil burden of proof, lack of witnesses coming forward, the understanding of reasonableness standard, and the application of the subjective and the objective tests to determine whether the conduct was unwelcome to a complainant Srivastava (2000–2001). Cases decided by the courts in Hong Kong reflect the illegal obstacles a victim faces to prove her case (Srivastava 2001). From year 1996 to year 2008, only a handful of victims have been awarded compensation in sexual harassment cases decided by the court. However from 2009 to 2016 the courts in Hong Kong have given higher awards (Srivastava et al. 2014).

The most significant of the decisions include *Yuen Sha Sha v Tse Chi Pan* (1999 award of compensation to a student) s *Ratcliffe v Secretary for Civil Service & Anor(1999)*, *Wong Kwok-mui v Lee Yuen-tim-*; *Chen v Tamraus and Another* (IBM)(2001); A v Chan Wai Tong (2009); Zero tolerance case, P v X (2012, compensation awarded to victim).

The latest 2008–2016 EOC data indicates that many cases do not reach the courts as many out of court settlements might indeed be taking place because of the efforts of the EOC for conciliation and resolution of the dispute between the employer and employee (EOC).

### China, PRC

Sexual harassment was dealt with under the PRC criminal law earlier. The Beijing Declaration on the rights of women was adopted in 1995 and the Law Relating to Protection of Women's Rights and Interests (Protection of Women Law, LRPWRI) in 1992. In 2005, the PRC Standing Council amended the law to prohibit sexual harassment at the workplace and align it with the national policy and constitutional provisions of gender equality. The LRPWRI 2005 provided for general principles and prohibited sexual harassment. However the law stipulated details of implementing rules and regulations for specific situations to the administrative bodies or local governments. Article 40, LRPWRI, prohibits sexual harassment of a woman by a man and recognizes the right of a woman complainant to report the matter to the relevant authorities. It declares that sexual harassment of a woman is a violation of the regulations relating to public security management and the wrongdoer can be subjected to administrative penalties (Article 58). A most significant feature is the provision of a right to seek remedy through a civil claim in the People's Court and ask for compensation.

### Definition

Under the Chinese law, sexual harassment means "any unwanted sexual advance aimed at women-featuring pornographic material or involving sexual requests in verbal, written, graphic, electronic, or physical form." Various provinces that have introduced sexual harassment as a prohibited conduct similar to the provisions in Hong Kong include Shanxi province (Measures to Implement the Protection of Women's Rights Law 2007), Sichuan, Shanghai, Beijing, Xian, and Kunming; all these provinces have legislated or submitted a draft bill setting out the forms of sexual harassment (Qiao Xinsheng 2008). The definition of sexual harassment has been adopted narrowly in some provinces prohibiting sexual harassment generally and also at the workplace (Qiao Xinsheng 2008).

### Conduct Recognized as Sexual Harassment

Unwanted sexual advances, groping in public, the use of sexually suggestive remarks, and emailing or text messaging of explicit sexual pictures are all covered under the definition of sexual harassment and thus prohibited. In a few provinces, such as Sichuan, law prohibits male political leaders from employing female secretaries. Sexual harassment is recognized as a wrong against a person or violation of one's dignity. Thus a victim is allowed to bring a sexual harassment claim for damages (both administrative and compensation) (Sharma 2010).

### Cases and Legal Difficulties in China

The consequences of the enactment of law and recognition of sexual harassment as a civil wrong can be seen in various cities all over China. There is increased awareness and higher reporting of such conduct by victims in the urban employment scenarios and despite the fact that culturally sexual harassment is more a social phenomenon in China (Killion 2004; Can 2005; Tan 2013). However although courts have provided compensation to victims who have been courageous to protest, the percentage of employers being liable for high costs is much lower than in Hong Kong or the West (Sharma 2010). Where women have made civil claims for compensations, the award of damages has been low. For example, in Sichuan a claim was brought by a victim in 2002, alleging extreme mental distress when the defendant forcibly embraced and hugged her. The court directed the defendant to tender an apology and awarded the claimant 2,000 yuan as damages. In 2003 a workplace sexual harassment case by a school teacher in Wuhan won her a public apology by the defendant as ordered by the court. In 2004, a Beijing court held a person liable for sending lewd comments to a woman. In this case the court enumerated the following factors for recognizing sexual harassment as follows: that the defendant's conduct must be one that has violated a person's dignity, the conduct must be unwelcome, and it must be sexual in nature and that there must be some overt act such as the use of sexual language, gesture, and signals (through eyes or otherwise) implying a demand for sexual favor. In this case the claimant was awarded 1,000 yuan as damages.

Quid pro quo sexual harassment is also recognized in China as in other jurisdictions; however

similar to common law jurisdictions, the complainant faces difficulties and procedural problems in bringing such a claim to the Chinese courts (Zhang 2005). The victim still needs to prove her case under the Chinese Civil Procedural Law. This places the burden on the victim to prove that she was, in fact, a victim of sexual harassment. The legal position of a complainant is similar to that of a plaintiff seeking a tort remedy in common law jurisdictions, e.g., Hong Kong, the United States, or even in India, and marks a new trend of grappling with the phenomenon of sexual harassment from a new angle (Sharma 2010).

In Xi'an in 2001 a victim alleged sexual harassment by her company manager at a state-owned enterprise. Since 1994 the manager sought sexual favors in return for better job prospects and kept touching the victim deliberately. Her repeated refusals and complaints did not stop the perpetrator. The victim lost at both the trial court level and the Intermediate People's Court as she had no direct witnesses who came forward to help her out of fear of reprisals or the witness statements were inconclusive. Similar failure of the victim can be seen in a Kunming case of 2002 due to lack of evidence and declaration of the conduct as being "non-serious" and that the lewd language used by the employee of the company "were mere jokes." In case of Lei Man (the first Beijing sexual harassment case) in 2003, the claimant failed as all direct evidence was contained in electronic documents, which the court refused to accept. In Leiman–Jiao case in 2005 and the school teacher vs. school headmaster case in 2006 to the Shanghai and Chongqing courts, the claimants couldn't prove their case due to lack of evidence. In the latter case, the complainant failed as she could not provide any evidence of having found the emails sent to her by the headmaster as unwelcome. The complainant had responded to some of those emails, but her correspondence was taken to mean that the relationship was consensual and that she did not find the conduct as unwelcome and hence she was not sexually harassed. Her appeal to the higher court also failed.

The cases as mentioned above demonstrate the difficulties faced by the complainants in the PRC as elsewhere – that of sufficiency of proof, burden of proof on the complainant – lack of witnesses and general gender bias (Sharma 2010).

The above observations mirror conclusions on the subject of sexual harassment elsewhere.

Where the courts apply the criterion of a reasonable woman's standard of the unwelcome sexual conduct, such decisions strengthen and legitimize the status of women and their fight against sexual harassment at the workplace and demand for being treated equally (Sharma 2010). Although the law relating to sexual harassment in China is still evolving, adoption of preemptive practices such as codes of sexual harassment-free workplace practices (as in Australia, Canada, or Hong Kong), adoption of circumstantial evidence, and reversal of burden of proof as with law in other common law jurisdictions will help resolve legal processes in the PRC and for the equality of women.

## Shamanic Leadership

Sandra Waddock
Carroll School of Management, Boston College, Chestnut Hill, MA, USA

### Synonyms

Charismatic leader; Difference maker; Inspirational leader; Shaman; Transformational leader

### Definition

A shamanic leader is someone who focuses on healing or making the organization, community, or world better, connecting across boundaries and disciplines to create integrative insights and practices, and sensemaking to provide meaning and purpose. These three functions of healing, connecting, and sensemaking are undertaken in the service of a better world.

### Introduction

In many traditional communities, an important leadership figure is the local shaman, the medicine woman or man, often a locally respected, even revered figure in the community (Waddock 2017). Many traditional and Indigenous communities rely on shamans for their healing abilities, as well as their wisdom. Shamans work to heal the community and individual patients. Though not all leaders are shamans, many more leaders and enterprises of all sorts could benefit from explicitly taking on the healing mantle of the shaman and acknowledging that their work involves three core shamanic tasks: healing, connecting, and

sensemaking (See Egri and Frost 1995; Frost and Egri 1994; Waddock 2014). Primarily, of course, the shaman is a healer, as Serge Kahili King says, of relationships of all sorts – with the self, with others, with the community, and in the world. As healers, shamans in traditional societies are the medicine men and women of their communities, called upon when someone is ill or there are problems in the community that require resolution.

Typically, most people today do not think of leaders as shamans. Yet using the skills of the shaman is arguably very much what successful leaders do as they help institutions, agencies, enterprises, communities, and organizations of all sorts cope with the many societal, political, and ecological issues now facing them internally and externally. Major external issues range from growing global inequality and climate change, both of which threaten the stability and longevity of societies (Diamond 2005). In addition, sustainability issues like topsoil erosion, pollution of the oceans, and deforestation, among many others, create the potential for major human crises. These types of conditions create the need for leaders to act in ways that heal not only their enterprises but also to create new business models that better cope with the external conditions that support those enterprises. Such issues – and there are many – pose significant problems for leaders as they relate to their stakeholders and the natural environment. The breadth and impact of issues like these on enterprise today means that leaders in all kinds of organizations and agencies face new demands to use the power of their enterprise, whatever it may be, to bring about some degree of healing in the world.

## Background of Shamanism

Shamans are said to have been the world's first healers, priests, artists, storytellers, timekeepers, therapists, and, of course, doctors and nurses, among others, of today's professions. Early signifiers or depictions of the shaman have been found in prehistoric cave paintings and other artifacts (Krippner 2004). Shamanism is among if not the world's oldest set of traditions, though typically each community developed its own specific traditions, beliefs, and practices. It is often associated with spirituality, locally specific rituals and practices, and a wide range of different belief systems, yet there are common threads across these many traditions that evidence themselves in the three main roles or functions of the shaman – healing, connecting, and sensemaking.

In traditional cultures, shamans orient their healing mainly toward individual patients and sometimes the community. Traditional shamans tend to work in altered states of consciousness, attained through a variety of means that include drumming, dance, drugs, among other approaches, to achieve what is essentially a hypnotic state. In that altered state of consciousness, they "connect" across realms to find information that can be used in healing, often seeking that information from spirits or guides, and bring that information back to help others heal in the sensemaking process.

The healing orientation of shamans differentiates them from so-called sorcerers, who use their skills and powers for selfish or negative purposes. Shamans are typically oriented toward the good of the whole system, at whatever level of analysis they are working. Because their work involves crossing boundaries of various sorts, they tend to see things holistically and systemically. Indeed, shamanism is sometimes associated with "seeing," in the sense of being mystically visionary, and it is in part the capacity to see what others do not – connect the dots – along with the ability to reframe situations and what has been learned that gives shamanic leaders power. Today's shamanic leaders "see" what others do not, in part by being able to connect across ideas, systems, and disciplines that others are not doing.

The belief in many traditional cultures is that when people get sick or the community is having problems, it is because their cultural mythologies, the ideas and beliefs that shape the community's sense of itself and how it acts in the world, are somehow askew

(Dow 1986). Traditional shamans do their work in part by reshaping dysfunctional cultural mythologies using information gathered when they "connect" with other realms than their ordinary or day-to-day realm. In these others, often spiritual realms, traditional shamans find new insights and information and bring that information back to their normal realm to help with healing what needs to be changed. In doing so, shamans also interpret and make sense of these new insights or information for others. These three activities – healing, connecting, and sensemaking in the service of a better community or world – are the main activities of traditional shamans. They are equally important, though accomplished differently, for today's shamanic leaders, who may not even be aware that they are undertaking them.

The connecting activity is similar if not the same as what psychologist Karl Jung called tapping into the collective unconscious, where wisdom is said to reside. Meditators and others in altered states of consciousness can similarly open to new awareness to gain insights or wisdom. Connecting, e.g., linking ideas, insights, and even people, can also happen in the state of flow, that is, when someone is "in the zone." Flow, first described in depth by psychologist Mihály Csikszentmihályi (1991), is also an altered state of consciousness that good leaders and coaches can bring about in individuals, teams, teams, and even whole enterprises. Flow is that state when time both disappears and expands, and the person is fully engaged in a challenging task or with people or a situation and feels energized and completely absorbed in the task/situation at hand.

From these types of altered state of consciousness, shamans and shamanic leaders can sometimes bring new insights and information back to their normal day-to-day realm or community. Using that information, they can then help others understand what they have learned by creating new or revised ways of viewing the world or reframing "broken" or problematic cultural mythologies. Doing that is engaging in the process of sensemaking, sometimes referred to as the spiritual leadership of the shaman.

## Shamanism as Leadership Practice Today

Today many people practice shamanism using traditional approaches, rituals, and practices. Using rituals from cultures other than one's own is not, however, what is meant by shamanic leadership. Shamanic leaders as healers work to heal their enterprises and communities in the context of today's complexities, working holistically and systemically to ensure that the enterprise operates in harmony with its stakeholders and the natural environment's constraints. Today's shamanic leaders as connectors connect across disciplinary, functional, sectoral, organizational, institutional boundaries and stakeholders to glean new insights, create new collaborative possibilities, and begin to work toward resolving difficult and complex problems with connected others. As sensemakers, they develop meaning out of the collaborative and systemic possibilities that exist and help others understand how all the "pieces" of different types of activities fit together, as well as developing ideas and insights shared with others. In other words, shamanic leaders take a healing attitude and orientation toward their work and use their ability to see the system and its parts as a whole to connect across a variety of domains as needed. They then help make sense (a new cultural mythology) of what is happening or needs to happen.

Notably, today's shamanic leaders work in the modern context, without necessarily tapping into rituals and belief systems that are integral and important to traditional cultures. While important and relevant in their own contexts, traditional rituals and practices may not be as relevant in our technologically sophisticated, highly interconnected, industrialized, or developing world. In fact, many leaders using the shamanic skills probably do not see themselves as shamans. They might not even relate to the term. Below, each of the three main shamanic tasks of healing, connecting, and sensemaking is explored in a bit more detail as expressed today.

*Healing*. Shamanic healing integrates heart, mind, body, and soul through what is sometimes called an integral practice, which simply means

having a variety of practices that attempt to keep all aspects of the person healthy. Shamans and shamanic leaders tend to think holistically. Importantly, the words whole, health, heal, and holy all derive from the same old English word, *hāl*, linking these concepts together in the work of the shaman. Holistic perspectives are integrative in that they do not separate mind and body on the individual level nor do they attempt to tease apart systems into their component parts, though they do ensure that all of those elements are working together successfully. Shamanic leaders with holistic perspectives see whole systems and enterprises as units that need to have integrity in and of themselves – in a sense, they are sacred or holy. Integrity, another form of wholeness, explicitly acknowledges the incorporation of responsibility and ethical considerations into the work of the enterprise or community as it fulfills its purposes.

For shamanic leaders, healing begins with the self so that strengths can be tapped in tough situations. It is difficult to lead or heal others effectively without significant self-awareness, self-regulation, motivational abilities, empathy, and social skills, which are the attributes of emotional intelligence; hence shamanic leaders are likely to have high levels of emotional intelligence. In addition, healing for leaders involves the capacity to see the world or situation realistically and then take necessarily to make changes that hope to improve the system or situation. That is, the shamanic leader works to make fracture, fragmented, or dysfunctional systems whole again, so that they function well and able to act fully as persons, rather than fragmented into disconnected units that do not relate well to each other.

*Connecting*. The second major function of the shamanic leader is that of connecting. Traditional shamans sometimes "journey" to other realms using imaginal (vivid and realistic imagination) thinking when they are in altered states of consciousness, where they collect wisdom, insights, and new ideas. Shamanic leaders can similarly connect, e.g., to the collective unconscious, during meditation or flow experiences. Alternatively and perhaps more in keeping with modern sensibilities, they can simply work across different types of disciplinary, functional, or institutional boundaries to gain new insights, ideas, and innovations. As working with a variety of stakeholders has become increasingly important in organizational success, this skill of connecting and understanding has become ever more important.

Internally, for example, leaders have to ensure that employees and, when relevant, other stakeholders are working together and doing their best for the enterprise, providing core purposes that attract people and enable them to commit to those purposes. Further, leaders have to ensure that their enterprise, whatever it is, develops a sound – and broadly shared – strategic vision that copes with the external threats and opportunities that exist. In the way that they view their own enterprises, shamanic leaders connect people together with common or shared purposes and vision and connect the enterprise to its broader environment through responsible and ethical practices that are viewed as integral to how the business actually implements its business model. Because boundary spanning of all sorts has become imperative for many types of enterprise today, digitally connected as they are with the rest of the world, the shamanic skill of connecting is also increasingly important. Just getting the insights from diverse sources and "connecting the dots" to create a vision, strategy, purpose, or practices, however, is insufficient. The shamanic leader also needs to use the sensemaking skills of the shaman to interpret and make sense of what has been learned for others.

*Sensemaking*. Sensemaking is a word coined by management scholar Karl Weick to mean making sense of or interpreting and frame events, ideas, visions, and narratives in ways that help others understand them. Sensemaking is important particularly where there is a difference between reality as it exists and is perceived and some desired reality or future. Since shamans believe that healthy cultural myths are important to both individual and community well-being, when myths become dysfunctional or "broken," they can do harm to the community. Similarly, when leaders articulate a vision for their enterprise, help stakeholders better understand what is happening, and work collaboratively with others

to create meaningful insights, experiences, and work, they are sensemaking.

When sensemaking is done well, shamanic leaders in a sense become storytellers and are sometimes seen as visionaries. Good sensemaking involves working with the core units of cultures and memes, that is, ideas, phrases, images, artistic expressions, and brands, to construct credible and viable stories or narratives (Waddock 2017). When such stories, narratives, and images are resonant, they tend to be amplified by moving from person to person. Sensemakers use powerful and resonant memes in their leadership roles to inspire others, create powerful images of the future, and help guide stakeholders toward common goals. Shamanic leaders clarify reality through their sensemaking as it is experienced by others by reshaping it in powerful new ways, especially by articulating purpose and vision.

*Shamanic leaders integrating healing, connecting, and sensemaking*. Dealing with external stakeholders is important for many in leadership positions, and, of course, there are stakeholders internal to the enterprise whose interests and needs also require the types of skills shamanic leaders can bring. Internally, leaders have to unite employees and other key stakeholders around shared ideas, purposes, and visions that enable them to commit to the enterprise and do their best work. Doing that is engaging with the healing and sensemaking functions of the shaman. Not only do leaders have to accomplish whatever purpose they or their enterprise has established, but they also need to make sense of that purpose and its accompanying vision for others, which is clearly a sensemaking task. To accomplish the sensemaking, they need to draw from the wisdom and insights of many different stakeholders, who are within their own organization, industry, or sector, as well as ranging widely across many different types of functions, activities, and enterprises whose activities affect the leader's own enterprise.

## Conclusion

Today and into the future, leaders also need to find new insights, innovations, and vision in a very difficult external context with many potential sources of disruption. Successfully linking or connecting stakeholders or creating innovative visions means connecting across organizational, functional, sector, and institutional boundaries to gain insights that are not available from a single source. Combining sensemaking and connecting, shamanic leaders also bring their enterprise and its stakeholders together around a common set of purposes and help others see how the whole system operates effectively in its context.

Shamanic leadership involves some risk taking, as shamans need to find their own core purpose and heal themselves before they are able to heal others. This personal healing has been called "becoming fully who you must be" rather than who others think you need to be. Doing so enables leaders to use their unique gifts toward somehow making their enterprise and, accordingly, the world a better place. Notably, the orientation of the shamanic leader is toward healing – building a better world – rather than being self-interested.

Today's shamanic leadership adapts the core constructs of shamanism to the modern setting. The three tasks of healing, connecting, and sensemaking can enhance leadership by drawing on deep sources of creativity, insight, and knowledge, crossing traditional boundaries to gain new insights and making sense of new realizations and awareness for themselves and others. Doing so ethically and responsibly, as shamans must because of the power they tend to command, can help create responsible agencies and organizations. Bringing people together around a common vision and strategy, for example, integrates all three shamanic tasks. It operationalizes healing, e.g., ensuring that people are integrated into the enterprise successfully and able to do their best work. By working across stakeholders and sectors, gathering information and insights from all of them to ensure a rich set of data on which to draw, the shamanic leader is connecting. When clarifying and explaining ideas, initiative, and vision to others, the leader is sensemaking, e.g., developing purpose among relevant stakeholders that unites them around a common vision.

# Shar'ia Law and the Social Policy of ISIS

L. S. Waits-Kamau
Regent University, Virginia Beach, VA, USA

## Abbreviations

All-Qaeda in Iraq (AQI); Islamic State (IS); Islamic State of Iraq and al-Sham (ISIS); Islamic State of Iraq and the Levant (ISIL)

## Synonyms

Al-Sham (traditional name for Syria); Caliphate (*Khalifat*); Emir (*Kalif*)

## Definitions

Levant (generally Iraq and Syria in the Middle East); Secular (not religiously affiliated); Shia (Shiite Persian sect of Islam that is based upon a different understanding of the succession and authority of leaders and other elements of Islam); Sunni (Arabic sect of Islam that places emphasis on the sayings, known as the *Sunnah* of the prophet Muhammad and his close relatives and colleagues during Islam's formative years). *Zakat* (Muslim charity or Islamic social welfare system); *Jihad* (struggle of a personal nature against sin or when attacked by an enemy); Jihadism (an insurgency in the waging of a holy war); Insurgency (attacks by an armed group that is not part of a state military group); *Ummah* (the

Muslim–Islamic community as a whole or as a group); Shar'ia (Islamic legal system); Emir (the appointed leader of the caliphate); Ramadan (the Islamic holy month of fasting and prayer); Hajib (a full head and dress covering worn by some Muslim women).

## Introduction: The Attempt to Reestablish an Islamic Caliphate in the Levant Based on IS Radicalized Social Policies Under Shar'ia

The social policies of the group calling itself the Islamic State (IS), a diminutive version of the geopolitical, self-declared titles of Islamic State of Iraq and the Levant (ISIL) and/or Islamic State of Iraq and al-Sham (ISIS), were framed by the overarching aim of an insurgency campaign to conquer cities and territory as well as to impose a new social order for the entire population within the "expansionist stage" of caliphate formation. The purpose of the IS insurgency involved an attempt to end secularist state rule and impose the radicalized social policies of Shar'ia in Muslim-majority states on both Muslim and non-Muslims within previously held IS territories. IS carried out a campaign of forced conversions and coercion of all peoples (both Muslim and non-Muslims) living in former IS-held territories under the self-proclaimed IS "emir" Abu Bakr al-Baghdadi (Zelin 2014). In October 2019, al-Baghdadi died by detonating a suicide vest while trying to avoid being captured by US Special Operations Forces who had pinpointed his hideout and cornered him in Northwest Syria (US State Department 2019).

The group he led (more popularly known as ISIS or IS) as its self-proclaimed caliph followed the fundamentalist Salafi-Wahhabi School of Sunni Islamic Theology that was also followed by Al-Qaeda's founders. Prior to the formal announcement of the IS-led attempts to reestablish a so-called "caliphate" in Syria and Iraq in June 2014, IS had formerly operated as an Al-Qaeda offshoot called Al-Qaeda in Iraq (AQI) under AQI leader Abu Musab al-Zarqawi. Al-Zarqawi was killed in a US-led coalition airstrike during the Second Iraq War in January 2006. Al-Qaeda leadership (under Ayman al-Zawahiri who took over leadership as head of the group following the death of founder Osama bin Laden) dissolved Al-Qaeda's affiliation with AQI (initially under al-Zarqawi's leadership, which morphed eventually into IS, dropping the Al-Qaeda franchise affiliation and name). The rift that ended the two groups' relationship was based on AQI/IS tactics of targeting other Muslims (particularly Shias), while Al-Qaeda mostly targeted non-Muslim groups or governments based on Al-Qaeda leadership's disdain for outside influences that they perceived were interfering within "Muslim lands" under Shar'ia (al-Zarqawi 2004). Hence, the fallout between IS (under AQI leadership of al-Zarqawi) and the worldwide Al-Qaeda organization (under bin Laden and later al-Zawahiri's leadership):

> In 2005, bin Laden deputy Ayman al-Zawahiri castigated AQI's Zarqawi for indiscriminately attacking civilians, particularly Shias. Zawahiri believed that such violence would alienate Sunnis from their project. That was indeed the case, as many Sunnis allied with the [new Iraqi] government during the Awakening movement. A more thorough rupture came after the start of Syria's uprising. Zawahiri, who succeeded bin Laden as al-Qaeda's chief, privately ruled that the emergent Syrian al-Qaeda affiliate, Jabhat al-Nusra, remain independent, and [al-]Baghdadi's organization [was] restricted to Iraq, a move [al-]Baghdadi publicly rebuffed. Since then, the two groups have at times fought one another on the Syrian battlefield. (Laub 2016)

The grand strategy and aspirations of the group calling itself Islamic State (IS), which have come to a standstill after a coalition of states and other groups in the region (Global Coalition to Defeat ISIS) joined forces to drive IS out of the region's cities, were initially extended by recruitment of warriors on a worldwide basis through social media and conquering new populations by conducting raids and attacks to capture cities in the Levant territories as well as assets such as oil fields, dams, and banks among other public institutions in areas conquered or occupied by IS in Syria and Iraq (Laub 2016). The IS insurgencies included the taking of hostages and the public execution of some of them to create followers on

social media and via the Internet. IS victims included journalists and contract or humanitarian aid workers from abroad, for recruitment publicity as well as for the use in war propaganda scare tactics, and attempting to recruit not only warriors but also young women from both near and afar to marry IS warriors and populate and enlarge the caliphate they were trying to resurrect based upon utopian-style implementation of IS social policies and Shar'ia in all their captured territories in the Levant.

IS leader Abu Bakr al-Baghdadi had previously announced the existence of a new Islamic caliphate based out of Raqqa, Syria, on June 29, 2014, in a video-taped message in which al-Baghdadi also demanded allegiance by all people within IS-held areas after his appointment as caliph was confirmed by the IS Shura Council (religious board of elders). However, in both 2015 and 2016, there were unconfirmed reports of al-Baghdadi's death following repeated US-led coalition airstrikes in Raqqa. The June 2015 reports were later discredited as were other attempts on al-Baghdadi's life in June and October 2016 previously. Finally, however, on October 27, 2019, al-Baghdadi's death was confirmed after US Special Forces reentered Syria one day before in an attempt to find and capture al-Baghdadi. During the ensuing capture attempt, the IS leader detonated a suicide vest ending his own life and that of three children he had taken with him while trying to escape US Special Forces (Chalfant 2019; US Department of State statement by Michael R. Pompeo on October 27, 2019).

At its beginning, IS insurgencies into Iraq and Syria had attempted to strategically exploit the prohibitive theological divide between Sunni and Shiite Muslim ideologies, which regard each other as heretical sects. Throughout areas of Syria and Iraq, the specter of Shia-led governments created Sunni antagonism and the perceived necessity of security against opposing factions in the Sunni-Shia power struggle that has been influenced and backed by the Shiite militias from Iran as well as by the Russian-backed protection of Syrian president Bashar al-Assad. This struggle has been especially apparent in the civil war–ravaged, rebel-controlled areas of Syria where other opposition groups were competing for strongholds to combat the sometimes desperate strong-armed tactics of the Assad regime to maintain minority Alawite control in Syria, which the younger Assad inherited from his father, the late Syrian President Hafez al-Assad. Some of these groups were also embroiled in battling Turkish forces most recently near Turkey's border with Syria. In October 2019, Turkish forces invaded Northern Syria in an attempt to eradicate some of these groups, which had been fighting against IS, including Kurdish groups that along with US forces had been fighting against IS in Northern Syria. After a truce was called, a buffer zone was created along the Syrian–Turkish border to allow Kurdish troops safe withdrawal after the USA brokered a truce by Turkey in the same month in exchange for pulling back sanctions that had been levied on Turkey for the attacks.

IS has also spread its tentacles beyond the Middle East through alliances with other insurgent fundamentalist Salafi-Sunni groups such as Boko Haram, which operates in northeastern Nigeria and the Sahel and which pledged allegiance to IS and al-Baghdadi in 2015. IS also has Egyptian, Tunisian, and Libyan counterparts and alliances with other groups in North Africa as well as in Afghanistan, Tunisia, Libya, and as far as the Philippines and Australia, as well as within Europe. An international crisis report in *Foreign Policy* (FP) about IS influence and affiliates cited a *New York Times* article by Carlotta Gall on January 1, 2016, noting the potentially imminent danger of local gangs in Niger and other African nations of the Sahel becoming IS and/or Boko Haram–affiliated operatives:

In a January [2016] dispatch from Niger, the *New York Times* reported that "as Africa's jihadists come under the wing of distant and more powerful patrons, officials fear that they are extending their reach and stitching together their ambitions, turning once-local actors into pan-national threats" (Gall 2016 quoted in Kennan 2016a, b).

An article in *The East African* weekly newsmagazine documented this type of ad hoc recruitment by IS in East Africa, which had allowed the

exporting of IS to areas of Africa (AFP Special Correspondent 2016, 29):

> Recent arrests show[ed] the Islamic State's growing presence in East Africa, where they [had been] recruiting young Kenyans for jihad abroad, raising fears that some of them will return to stage attacks in the country (AFP Special Correspondent 2016, 29).

## IS Social Policies Derived from "Expansionist Program" Under Radicalized Enforcement of Shar'ia

Social media recruitment of fighters formed the major publicity and propaganda function within IS outreach that allowed the steady growth of IS recruiting efforts after the founding of IS following the group's split from AQI (based on tactical disagreements). (Using the name "Islamic State" posed a political irony given that the IS-proclaimed leader al-Baghdadi and his followers had rejected outright the international "state system" within major Islamic areas in the Middle East and other regions.) However, following recruitment of warriors abroad and in the Middle East to wage a "holy war" (jihad), which has been delineated by some as "jihadism" (Nawaz 2015, C1–2), IS also began recruiting young women to join the group to also expand the caliphate through marriages and the creation of new families to populate the areas that had been captured and held under IS policies of Shar'ia according to the Salafi School of Sunni Islam (Frosch et al. 2015, A3).

Therefore, the aggressive expansionism of IS during 2016 and 2017 was the primary driver of the group's domestically oriented social policies within the so-called expansionist stage of the IS caliphate. IS social policies were largely based upon spreading utopian-style propaganda about idyllic conditions for Muslims throughout the region in which women were called upon to protect their homes and children while men were away fighting. Young Muslim women were the targets of this propaganda in nearby Sunni-majority Middle Eastern states, such as Saudi Arabia (Al-Khanssaa Brigade 2015), as well as in Europe, Britain, East Asia, and as far as Australia and the USA (Frosch et al. 2015, A3).

IS closely followed the ideologies of Al-Qaeda but with a twist, since unlike Al-Qaeda, IS also developed domestic, territorially based social policies (involving those who live within the shifting swathes of territory held by IS during the height of its conquests in 2014–2015). The group's areas of operation were expanding territorially until 2015 (Institute for the Study of War 2015) when certain areas, such as Mosul, were retaken in Iraq as were some cities and areas of Syria. However, from its northern Syrian base of Raqqa, IS continued to enforce its social policies that emanated from al-Baghdadi's Salafi fundamentalism and the implementation of his version of radicalized Shar'ia for all people (Muslims of all sects and non-Muslims) within IS-held cities and areas:

> The northern Syrian city of Raqqa is often cited as the Islamic State's de facto capital. There, the group established some new institutions (e.g., judicial, police, economic) and coopted others (e.g., education, health, and infrastructure) to provide residents a modicum of services and consolidate its control over the population (The Economist, Staff 2016).

The IS grand strategy of caliphate expansionism was linked to similar aims as those of Al-Qaeda in that both groups focused on ideological spread of Salafi-Sunni dictates for building the Islamic community, or *Ummah* – mainly by forcing the population in conquered cities or regions to convert to Islam, leave, or suffer the consequences of paying taxes or of death. However, IS and Al-Qaeda became separate rival insurgent (hierarchically distinct) groups that were vying for adjacent, if not overlapping, territories in which both groups indicated similar long-term goals, including their similar

> . . .aim to overthrow all existing governments in the Muslim world and replace them with their own, and later, to attack the West from a position of power to spread their ideology. Separating the elements of ISIS and al Qaeda that are actively working to attack the West from the main bodies of those groups fighting in the Middle East, Africa, and South Asia is impossible. All al Qaeda groups and ISIS affiliates seek to take the war into the West to fulfill their grand strategic objective of establishing a global caliphate, albeit according to different timelines (Institute for the Study of War 2015b).

To reestablish the caliphate (as an insurgent political utopian regime) required major outreach and publicity (through war propaganda) efforts as well as the use of social media reaching both far – the USA, the UK, Europe, Australia, East Asia, and North Africa – as well as near in Middle Eastern states, and this tactic became IS's "forte" (The Economist 2016). The Media and Communications Department of IS (in charge of creating IS propaganda and recruitment tools and campaigns as well as IS literature such as the slick *Dabiq* magazine and online media) produced and released infamous videos and messages reaching a global audience of young jihadist-primed men and women, not only in the nearby Middle East but also in Canada and the USA and potentially by extension in European countries to which Middle Eastern and North African Muslims migrated.

IS had (through its literature) created and promoted an inherent Sunni Muslim–based socio-legal policy of superiority, encompassing Muslims and excluding non-Muslims who lived within IS-held cities and areas. This overarching social policy encompassed IS warriors, their wives, and families (including children born within these families), as well as inhabitants held in relative captivity because they could not escape the territory that was captured or in some cases because they were threatened with death if they did not pledge allegiance to al-Baghdadi and IS and pay required homage taxes, and even some hostages (such as the Yazidis, Kurds, and other distinct religious and/or ethnic groups who had been captured, moved, and brought into IS strongholds). In some cases, women and children were killed or in rare cases released back to their home areas.

## 2014 Ramadan Declaration Describes IS Social Order Based upon a Radicalized Version of Shar'ia

Abu Muhammad al-Adnani, who was initially the main public spokesman for both IS and al-Baghdadi, helped visualize and provide the framework for realizing the dream of a Salafist caliphate based within the Levant in his 2014 Ramadan speech "The Promise of Allah." Al-Adnani's speech was taped for broadcast on June 29, 2014, the same day that al-Baghdadi was announced as the head of the new caliphate at the IS Raqqa, Syrian headquarters (Kelsay 2016, 9–17). Al-Adnani's speech set up a more-grounded vision that established a so-called IS caliphate under the authority of al-Baghdadi as "emir."Al-Adnani's speech along with al-Baghdadi's announcement strategically set IS apart from Al-Qaeda in terms of encompassing militant acts of jihad within "far and near enemies." This tactic presumably would put pressure on and drive out international state powers from Muslim lands (within current Muslim states) to purge out all Western influence within existing Muslim states until such time (in the future) as they (under the IS version of Shar'ia) would eventually unite the *Ummah* (Muslim community) throughout the world. This aspect of a new social order that was visualized by Al-Qaeda and actualized in the IS vision and mission has been analyzed for its social constructs by John Kelsay, who compared the mission of IS with that of Al-Qaeda (Kelsay 2016, 11):

> Theirs [Al-Qaeda's] was a gradualist vision, whereby Muslim peoples freed from tyranny might be educated and brought to the point of establishing proper governance, first in more delimited regions, and then through recognition of a more general or universal union (Kelsay 2016, 11).

However, al-Adnani clearly declared the IS intention to reestablish the caliphate under al-Baghdadi's leadership after presenting al-Baghdadi's lineage and so-called rights to be appointed as the caliphate's new emir or caliph (*kalif*).

> If your leaders whisper to you claiming it is not a caliphate, then remember how long they whispered to you claiming that it was not a state but rather a fictional, cardboard entity, until its certain news reached you. It is a state. Its news will continue to reach you showing that it is a caliphate, even if after time. (Zelin 2014) (Quoted from al-Adnani's June 29, 2014 speech "The Promise of Allah" that he delivered on the first day of Ramadan in 2014 (June 29). In: Aaron Y. Zelin (2014) "ISIS Is Dead, Long Live the Islamic State" (June 30, 2014). (Online at: www.washingtoninstitute.org/.../isis-is-dead-long-live-the-islamic-state.)

In his analysis of al-Adnani's 2014 Ramadan speech, Zelin also noted that:

> Adnani outlines the duties and responsibilities for Muslims in general and those who live within the Islamic State's current borders, now that the caliphate has been established. For all intents and purposes, according to the Islamic State, there is no other authority but them: 'We clarify to the Muslims that with this declaration of the caliphate, it is incumbent upon all Muslims to pledge allegiance to the Caliph Ibrahim and support him,' said Adnani. 'The legality of all emirates, groups, states, and organizations becomes null by the expansion of the caliph's authority and arrival of its troops to their areas' (Zelin 2014, quoting Al-Adnani's speech).

In Kelsay's somewhat similar but more socially poignant analysis, he delineates "the vision of IS" as different from Al-Qaeda's understanding of its religio-political mission:

> . . .true governance consists in 'compelling the people to do' that which God commands.
>
> A group that comes into power, in the sense of effective control of a territory sufficiently large to require administration, must establish a state consistent with the designation *khilafat*. Otherwise, obedience will be lacking, and the promise of God will be unfulfilled. Similarly, a community of believers may fail in obedience if it fails to govern according to the Shar'ia. The strategic program of IS begins with a focus on building the state and its institutions. Shi'a forces—here understood to include the Iraqi army and various militias linked to Iran, as well as all those associated with the Assad regime—are identified as *rawafid,* a term that suggests a combination of heresy and treason. These are to be removed from the territory of an Islamic polity, as are Sunni groups that do not obey the command to swear loyalty to the Islamic State (Kelsay 2016, 11).

Based on Kelsay's analysis of al-Adnani's speech at the beginning of the 2014 holy month of Ramadan, "The IS project is a matter of establishing a social order considered legitimate by the membership because of its consistency with divine law" (Kelsay 2016, 12). Kelsay goes on to explain that IS expressed a socially imposed zeal for Shar'ia according to purification and purging of all non-Muslim influences per the Salafi-Wahhabi extremist Sunni understanding of ruling under Shar'ia:

> In this, the group combines an emphasis on a certain understanding of justice, doing what is understood to be right, with an impulse toward purity, in the sense that if things are not ordered correctly, the community is in danger. The promise of God thus comes not only with a condition, but also with a warning. Those who fail in obedience will not succeed. They will instead become the objects of divine punishment, expressed in terms of dishonor and defeat (Kelsay 2016, 12).

Al-Adnani viewed the caliphate as the realization of God's provision to Muslims for the administration of Shar'ia, but only according to al-Baghdadi's administration and authority as supreme. According to a *Foreign Affairs* analysis by Andrew F. March and Mara Revkin, the IS social program involved building a utopian kingdom on earth that would express divine law and order encompassing all people within its jurisdiction, not just Muslims:

> Indeed, whatever ISIS believes about the apocalypse, it sees itself as creating a distinctive and authentic legal order for the here and now, one that is based not only on a literal (if selective) reading of early Islamic materials but also on a long-standing theory of statecraft and legal authority (March and Revkin 2015).

## IS "Manifesto on Women" Illustrates Utopian Social Policies of IS Under a Radicalized Shar'ia

To understand IS strategy and social policies, IS has issued a war propaganda document outlining the role of women – calling the document a "Manifesto on Women" in which the group's social policies and even a snapshot of life within the caliphate are delineated and illustrated, complete with photos portraying the idyllic life under Shar'ia, albeit imposed upon all by IS (Quilliam Foundation 2015, 5). The introductory note of the translator explains how the IS "Manifesto on Women" was disseminated online: "On January 23, 2015, online supporters of Islamic State (IS) began circulating a document entitled *Women in the Islamic State: Manifesto and Case Study*. The text, which was uploaded by the all-female Al-Khanssaa Brigade's media wing onto a jihadist forum used by IS, was widely distributed among its Arabic-speaking

supporters. However, it was not picked up by Western jihadists, male or female. As such, it ran the risk of slipping through the net of non-Arabic speaking Western analysts. To stop this from happening, Quilliam provided a full translation of it" (from the Introduction, page 5). While the "manifesto" was aimed at the target recruitment audience of women in Saudi Arabia (the al-Saud Kingdom), it was authored in part by an element known as Al-Khanssaa Brigade, which the commentator (who translated the document from Arabic to English) explained as: "a branch of IS that has appeared in Western media, variously dubbed a female policing brigade, propaganda group and recruitment organisation, depending on the reason for its being mentioned" (Quilliam Foundation 2015, 5). The translator's synopsis of the document provides an overview that outlines the IS social policy and view of the roles of men and especially women within the caliphate, which the translator described in his introduction:

> Throughout, the author(s) attempt to convince their audience that it is a fundamental necessity for women to have a sedentary lifestyle. Indeed, this is her 'divinely appointed right.' Each of the three sections seeks to present supporting evidence for this conception—historical, political and theological. However, it is the first part of it that provides the most illuminating look into the psyche, ideology and worldview of a female IS supporter and the means by which they go about building a rationale for their position. (Quilliam Foundation 2015, 7)

The IS "Manifesto on Women" aimed at recruiting wives for IS warriors, strives to persuade women in Muslim nations such as Saudi Arabia that they are not able to fulfill their duty as Muslim women if they do not join the jihad of IS as warriors' wives who will eventually become mothers of the so-called caliphate's future occupants. The "manifesto" speaks to the simplicity of what it says Muslims are called to in terms of a life of religious sanctity that excludes education outside of religious education except as necessary to provide for medical studies to care for Muslims and other sciences that provide necessary trades to provide for the needs of Muslim daily life (Al-Khanssaa Brigade 2015). So the manifesto sought to reorient the thinking of Muslim women so that they may wholeheartedly strive for the honor of jihad as wives of IS warriors undergoing difficulty for the sake of building the caliphate in its socio-rhetorical propaganda appealing to radical Islamist language calling for jihad against non-Muslims:

> We must correct that which has become entrenched in our minds since we were small, what we were told by our teachers that Muslims must prove to the disbelievers of Europe and elsewhere in glorious days gone by, that he had built material civilisations, its heroes the atheists and libertines like Ibn Sina the esoterist, Ibn Nafis [who discovered the circulation of blood] and Ibn al-Haitham [optics and physicist] and others. The civilisations of these people were built upon the ruins of those before it. Now, we must disavow these heretics, these "geniuses" of Europe—they are friends and protectors of each other. Muslims do not need what these people provided. Muslims do not need to spend long parts of his short life learning of the worldly sciences that give no spiritual reward, apart from that which repulses the might of the infidels and benefits Muslims. This issue is known and clear—Muslims do not need any of the above (Al-Khanssaa Brigade 2015, 13).

Beyond this general exhortation for Muslims in the caliphate to avoid scientific education (except as necessary to assist Muslims with medical care or warcraft) and secularism, women were allowed (according to the "manifesto") to promote the caliphate during the time of formation – even though the "manifesto" reverses the idea of Islamic expansionism (which in actuality represented the IS program at that time) into a defensive posturing of IS lands being under attack. (This is amazingly difficult to understand given IS social media portrayals of IS warriors wielding swords and guns against unarmed civilians, most with their hands tied behind their backs, including foreign journalists and humanitarian aid workers, as well as regular civilians, including some children, from villages and areas across Iraq and Syria and areas where IS affiliates operated within other countries. The majority of these victims and hostages of IS were not soldiers, nor ever had been fighters, and therefore had no means of attacking IS or even of defending themselves as such.) Nevertheless, in the "expansionist stage," women in IS were permitted to:

> go out to serve the community in a number of situations, the most important being:
> 1) Jihad (by appointment) –if the enemy is attacking her country and the men are not enough to protect it and the imams give a fatwa for it, as the blessed women of Iraq and Chechnya did, with great sadness, if the men are absent even they are present.
> 2) The most common reason is for studying the sciences of religion.
> 3) Female doctors or teachers may leave, but they must keep strictly to Shar'ia guidelines.

"It is always preferable for a woman to remain hidden and veiled, to maintain society from behind this veil. This, which is always the most difficult role, is akin to that of a director, the most important person in a media production, who is behind the scenes organizing" (Al-Khanssaa Brigade 2015, 22). (Underscoring of text was added for emphasis but was not underscored in the original or in the translated text.)

## IS Social Institutions and Policies Portrayed in IS War Propaganda Documents through Social Media Distribution Channels

In the IS "Manifesto on Women" case study attached to the end of the IS-produced document, readers are provided with idealized glimpses of the utopian social order of life within several cities that IS had occupied. Some of these cities, such as Mosul, Iraq, have since been recaptured by the Iraqi government. Even though IS women were to remain at home according to IS Shar'ia policy, except when allowed to leave by their husbands, if married, or fathers/brothers, if not married, the Al-Khanssaa Brigade indicates that members of the group traveled about for the purpose of documenting life in IS-held cities:

> Al-Khanssaa Media travelled these lands to check on the happy situation that Muslim women face and their return to what was there at the dawn of Islam and the black robes that enrage the hypocrites and their friends, and the good news that this situation gives regarding development and ascendance to the summit of this glory throughout the expansion of the State of Muslims and the longer it remains, we see it growing and strengthening by the hour, as was ordained by their God, they have the support of the truthful men, who build it with their skulls [lives]—before undertaking the formation of the trappings of a state, there are institutions of stone and iron (Al-Khanssaa Brigade 2015, 27).

The Al-Khanssaa Brigade's media crew provided a snapshot report on what they portrayed as idyllic conditions for all Muslims living within the confines of the IS-held cities of Nineveh, Mosul, and Raqqa, including old and young, rich and poor, as well as men, women, and children. The "manifesto" portrays IS administrators as fairly and equally distributing money from the IS treasury and also appeals to the quality of justice, truth, and protection of women (as long as they obeyed Shar'ia) and describes what the authors dub as the "happy" plight of women and of their children, as well as racial/tribal equality among all inhabitants of IS-held cities and areas (Al-Khanssaa Brigade 2015, 27). (This section of the manifesto, called "Women in the Islamic State: A Case Study," provides a review of daily life under IS in three cities as well as some other regions captured and occupied by IS at the time of publication of the "manifesto"– which previously included Mosul, which was freed from IS occupation in 2015.)

Toward the end of the IS "manifesto," cases outlining injustices against women in both the Sunni-majority Gulf states and in Shiite-majority states "who say 'Lord is God'" are presented (Al-Khanssaa Brigade 2015, 38). This is the point at which analysts become aware of the target audience for this publication, which evidently was primarily aimed at reaching Muslim women within Saudi Arabia as well as women in Gulf states. The authors used the polemical term "hypocritical kingdom" throughout the "manifesto" instead of naming a nation in most cases but later in the document refer to Saudi Arabia by name as well (Quilliam Foundation 2015, 8). (See also translator's note on p. 8: "The final section compares how women fare in the Arabian Peninsula to what their lives were like in IS-held Iraq and Syria before liberation by the Global Coalition to Defeat ISIS that drove IS out of Iraq and then finally Syria. The content of this section notes that the primary target audience was women living in Saudi Arabia.") One other telling detail is

that "nationalism" and secular statehood, wherein people of all religions and/or none are included, are basically cursed as a repugnant social order (Quilliam Foundation 2015, 27–38). As mentioned previously, the "manifesto" juxtaposed examples of life of women who lived within IS-held areas with life of women in "in the Gulf" states and basically outlined the benefits of life in the caliphate for women in particular who needed assistance (such as divorced or widowed women with children or women whose husbands or sons had been arrested in Gulf states and may be imprisoned, including some women whom the "manifesto" says had been imprisoned or forced to work far from their homes) due to problems with receiving social security. The "manifesto" emphasized IS *zakat* (charity assistance) to women in the above categories (Quilliam Foundation 2015, 31). The IS-sourced "manifesto," however, never mentions the condition of the hundreds of hostages (men, women, and children) or prisoners who had been taken captive in former IS strongholds and cities. The document does mention poverty as a result of Shiite and even Sunni state government corruption and as a result of war conditions; however, the "manifesto" aspires to a socialist-like utopian welfare system for those living in poverty based on the Muslim system of *zakat*.

The means of funding IS social services and institutions are not mentioned in the "manifesto" document per se; however, some funding may have come from ransoming of hostages (from Europe and other countries except the USA, which has a no-negotiation/no-ransom policy) and proceeds from oil trade in Iraq, Syria, and North Africa, as well as donations and tributes that had been paid to al-Baghdadi and IS from other organizations and the previous IS-captured cities and territories, which have since been freed from IS control.

## Education and Marriage for Girls and Others in Previously Held IS Cities

The IS "manifesto" paid particular attention to delineate a specific educational curriculum for girls (between the ages of 7 and 15) and clearly states that girls are eligible for marriage when they reach age 9, however, without reference to whether or not these girls should complete their education if they are married before age 16 (Quilliam Foundation 2015, 24).

Educational policies outlined within the IS "Manifesto on Women" document include a focus on religious education and separation of the sexes throughout all levels of education, including primary schools and colleges according to the "manifesto":

> 1) Studying for all students in all stages in schools and universities continues. The state has not forbidden a thing.
> 2) The state has tried hard to separate male and female students in colleges. It has already done so at the University of Mosul, where it has spared no efforts.
> 3) The state has preoccupied itself with teaching children their religion and focused female education upon specialising in women and *fiqh*, for which were initiated Shar'ia institutes, courses and lessons in the schools (Al-Khanssaa Brigade 2015, 34).

Additionally, the "manifesto" includes photos of students at a primary school as well as girls in hijabs at an all-female school to illustrate the ability of girls to attend school and receive education at IS-run schools. Additionally a photo showing the entrance (gate) to a college for religious studies (Shar'ia) in Al-Bab, Syria, is also provided (Quilliam Foundation 2015, 35).

## IS Justice System and Policies Under a Radicalized Form of Shar'ia

While the IS "Manifesto on Women" does not mention anything about what happened to those who were killed by IS while hostages, the "manifesto" does describe the establishment of Shar'ia courts and justice for Muslims (but not for those outside Islam, especially women, whom the document mentions as needing to convert to Islam to be able to receive social protection and justice):

> Now, courts that rule by that which God decreed have been established, judges have been appointed

> long periods within which they can consult with the people on matters of marriage and divorce and inheritance, which concern women. The divisions concerned with these issues were applied without delay, as much as was possible. Women now go to courts and openly talk of their issues. They find that they are listened to and their issues are dealt with, without a need for bargaining or bribery—indeed some researchers have even suggested that the level of corruption within Islamic State is zero. If Christian women comes [sic] to the state courts to declare their conversion to Islam, then they enjoy full protection from any harm or abuse, whether it is paternal or something else (Al-Khanssaa Brigade 2015, 30).

## Health Care and Elder Care Social Policies

By juxtaposing pre- and post-IS services such as health care and elder care, the IS "manifesto" portrayed IS healthcare policies as segregating men, women, children, and seniors to offer health services and especially mentions maternity services:

> After the establishment of the [C]aliphate, hospitals got back to work and their shortcomings were fixed. The treasury of the caliphate has spared nothing on the people. It has rendered accessible to them modern medical technology that could treat all those suffering from chronic diseases, including cancer. The Caliphate has undertaken vaccination programmes for children and infants. Women benefit from a substantial amount of these services, for example the maternity hospital, which provides specialist care for mother and son who are examined by pediatricians who give them the cures they need. The state tries to stop men and women mixing and works to prevent it as much as it is possible and, thus, it has become the first and only place in which full government healthcare is given without mixing in modern hospitals. . . . The Caliphate has also cast under its cloak the elderly, men and women (Al-Khanssaa Brigade 2015, 31–32).

## Conclusion: IS Social Institutions and Policies Were Framed by the Expansionist Goals of the Group

The social policies of Islamic State (also referred to as "IS" throughout this artile) are derived from the expansionist program wherever IS had occupied cities or regions and enforced its Salafi-Sunni fundamentalist policies within Syria, Iraq, and other states in North Africa and East Asia where IS affiliates (including Boko Haram in Nigeria and the Sahel and other groups in North Africa and East Asia) were operating under al-Baghdadi's directives as franchises of ISIS. In terms of territory tenuously held by IS in Syria and Iraq (all territory has been taken back where IS has been driven out in Iraq and Syria), the social policies and institutions were publicized as recruitment propaganda in publications such as the "Manifesto on Women" published by the all-female Al-Khanssaa Brigade branch of IS under the auspices of IS leadership and imprimatur. The social policies outlined within the IS "Manifest on Women" are utopian descriptions utilized for recruiting of women by IS operatives and war propaganda.

Therefore, without journalistic or independent witnesses of IS policies, since all journalists living within IS cities or territory were forced to pledge allegiance and obedience to al-Baghdadi and his version and policies of Shar'ia, IS social policies remained idealized, propaganda tools for recruitment of IS warriors and wives by IS officers administering the group's social and communications policies centered on recruitment of both men and women as part of the now defunct expansionist insurgency goals of IS.

# Shell Companies and Government Corruption

David Jancsics
School of Public Affairs, San Diego State University Imperial Valley Campus,
San Diego, CA, USA

## Synonyms

Dummy corporation; Front organization; Offshore company; Stooge; Straw man

## Definition

A shell company is supposedly an independent, legal business entity that is used to separate and hide the identity of its real owner. The use of shell companies can be legal when they serve as technical vehicles facilitating complicated business transactions, but they are often used for illegal purposes.

## Introduction

As the Panama Papers leak exposed in 2016, the secret world of shell companies is not a small-scale marginal phenomenon, as previously believed, but a widespread and complex network of offshore companies in remote tax havens with the special function to cover the shady business of the global elite, including numerous senior politicians, heads of states, and dictators (Obermayer and Obermaier 2016). Yet, autocrats and their cronies extensively use shell companies, not just in tax havens but in the Western world so that they can hold their illegally accumulated wealth in the financial institutions of democratic countries (Sharman 2017, pp. 73–74). Moreover, corrupt politicians and government officials also use domestic shell companies in their home countries to facilitate illicit transactions (Jancsics 2017).

Shell companies are typically formed and maintained by Corporate Service Providers (CSPs), or intermediary law or accounting firms. Transactions and assets can be tracked back to shell companies established by a CSP but not to the actual people who indirectly and covertly exercise control over the company. Shell companies may constitute complex corporate structures in which they act as shareholders of another such company. One subcategory of shell companies, called "shelf" companies, includes organizations kept "on the shelf" for sale later on. Since financial institutions often prefer to do business with companies that have been in existence for a certain number of years, such appearance of longevity may be attractive to buyers who want to use shell companies to obtain leases, credit, and bank loans.

The use of shell companies can be perfectly legal. For example, they might be created for mergers and joint ventures by business partners to simplify matters or to guarantee impartial legal treatment for the parties in a neutral jurisdiction. Shell companies can be also used to hold personal or family assets to facilitate inheritance or protect against attachment by creditors (Van der Does de Willebois et al. 2011). Furthermore, when buying property or land, well-known brands often hide their identity behind shell companies so they can be protected from extortive price increases by the owner (Findley et al. 2014, pp. 33). Hollywood stars also use shell companies to shield the location of their residence from the general public. Firms, still legally, can create offshore shell companies in order to lower their tax bills at home. The lucrative business of shell companies in tax havens such as Panama can be traced back to the 1920s, but their use has significantly increased since 2005 when the European Union introduced a tax penalizing interest on income earned by EU residents in tax havens (Obermayer and Obermaier 2016, pp. 13). Since the tax applies to accounts owned by only individuals not shell companies, European depositors can shift their assets to such technical vehicles.

A shell company can hold bank accounts, own assets, and engage in transactions. In many countries, shell companies are cheap and easy to establish. Confidentiality is their key advantage. Since they provide convenient vehicles for moving money secretly, even across national borders or hiding real owners of assets, they can also be used for illegal purposes such as laundering money, evading taxes, financing terrorism, busting international sanctions, and facilitating corruption. This entry chapter discusses the specific phenomenon when shell companies are used in corrupt transactions. Here the most important function that a shell company can offer for its corrupt shadow owner is providing anonymity while simultaneously guaranteeing control over the shell company and its resources.

Despite the popular conceptions that shell companies exist only in exotic tax havens such as Bahamas, Cayman Islands, Liechtenstein, or Panama, the West has a significant role in hosting illegal money via shell companies. Surprisingly the majority of shell companies are formed in non-tax haven Western countries and dictators, such as those in Central Asia, are happy to use them to facilitate their high-level grand corruption (Cooley and Heathershaw 2017). Empirical research finds that CSPs in wealthy Western countries are the least inclined to comply with international standards (Findley et al. 2014). Domestic laws may also support such behavior. For example, the United States is among the most tolerant countries when it comes to regulating shell companies (Sharman 2017). Here CSPs are under no obligation to establish the true identity of the client who becomes the company owner. The most infamous tax haven states in the USA are Nevada, Wyoming, Delaware, and Florida. Some industries are especially vulnerable to corrupt shell company use. For instance, the US real estate industry makes less than minimal effort to examine the identity and background of property buyers behind shell companies (Cooley et al. 2018).

We can classify shell companies along two main dimensions, the location where companies are formed (offshore vs. onshore shells) and the form of operation (live vs. empty shells).

## Location: Offshore Versus Onshore

The main advantage of offshore shells for corrupt actors is that they are in remote tax haven countries where authorities are typically not too eager to investigate suspicious cases. Moreover, Webs of shell companies are often linked together across multiple offshore jurisdictions which makes obtaining information about them especially difficult (Van der Does de Willebois et al. 2011). The infamous Panama Papers leak in 2016 revealed the entire internal database of Mossack Fonseca, a major Panamanian law firm specializing in forming anonymous shell companies (Obermayer and Obermaier 2016). It included the records of 214,000 offshore shell companies, names of their true owners, passport scans, bank statements, and email conversations between the CSP and the owner's representatives. The leak exposed illegal money movements of several prominent figures, for example, the Nicaraguan president Arnoldo "Fat Man" Alemán, who has been declared one of the 10 most corrupt politicians of all time by Transparency International, a global anti-corruption watchdog. Alemán used shell companies to channel almost $100 millions of public funds into his own pocket. The Papers had serious political consequences such as the resignation of Iceland prime minister, a massive demonstration in Argentina, a small war in Azerbaijan, the block of words "Panama Papers" on the Internet by Chinese authorities, and the unpleasant confession of his late father's decade-long tax evasion by the former British Prime Minister, David Cameron.

Onshore or domestic shell companies are typically established by corrupt actors in their home country to facilitate corruption. Despite the fact that political campaign contributions are supposed to be transparent in most democratic countries, domestic shells are frequently used by powerful corporations to get access to the political arena while keeping their identity and affiliation with politicians secret. For example, in the USA, shell companies are often registered with the sole purpose of receiving untraceable and unaccountable donations for campaigns of politicians, even presidential candidates (Findley et al. 2014, pp. 29–30). The most recent example is the shell company, Essential Consultants LLC, established by President Trump's lawyer Michael Cohen to be able to pay hush money and receive invisible donations from companies such as AT&T and Novartis in return for "insights into the new president."

The establishment of police foundations is a relatively new phenomenon in the USA and Canada and can be also conceptualized as a form of onshore shell company (Walby et al. 2017). These foundations operate as private nonprofit charities and amass money from private corporations. Since these organizations are not subject to Freedom of Information Act legislation and other transparency requirements that are normal in the public sector, the identity of donors and the amount of donated funds are unknown. Such secretive operations may permit transactions in dark money and potential special police treatment of donors as "insiders" in return for financial support.

Domestic shell company arrangements also enable corrupt political elites to turn public resources into private ones under a veil of complete secrecy. These actors pay particular attention to making their operations seem lawful and extract money through legal contracts that require a large number of "clean" shell companies (Jancsics 2017). Some of these cases are discussed in the next section under the category of live shells.

## Form of Operation: Empty Versus Live Shells

Echoing the mainstream approach of shell companies, empty shells do not have real operations, employees, infrastructure, or assets while live shells, a less researched phenomenon, are functioning entities controlled by shadow owners (Jancsics 2017). Most offshore shell companies are empty shells that have no physical presence other than a mailing address, yet onshore or domestic versions of these companies also exist. This type of shell company is often set up only for a single corrupt transaction and then left dormant.

Empty shells can be established to serve a very simple function, receiving bribe cash secretly, for instance, in the form of a "consultancy fee." Corrupt politicians who worked to benefit certain corporations with government contracts are often paid via this structure (Findley et al. 2014, pp. 100).

An empty shell can also acquire assets for a secret owner. Investigative journalists revealed that nearly half of the most expensive residential properties in the USA are now purchased anonymously through shell companies (Story and Saul 2015). For example, in 2014 at the Time Warner Center in New York City, 80% of the units were purchased by shell companies, 37% by foreigners. Among the foreign owners, we can find top government officials and their family members and businessmen with close political connections from countries such as Russia, Mexico, India, Malaysia, or China. They may not be all criminals, but such structure is perfect for hiding assets bought with corrupt money. At least 16 foreigners in the Time Warner Center have been the subject of government inquiries, either personally or as heads of corporations. We can find a similar pattern in London where in 2015 more than 40,000 residential and commercial properties were registered to overseas companies, most of them with invisible ownership structures incorporated in secret jurisdictions such as British Virgin Islands, Jersey, Isle of Man, or Panama. Research finds that corrupt senior politicians in post-Soviet countries such as Kazakhstan and Kyrgyzstan routinely use shell companies to channel rents from state assets to the Western real estate industry (Cooley et al. 2018).

Empty shells are also used as technical vehicles to facilitate mainly domestic, corrupt transactions (Jancsics 2017). In this case, they have a switcher function. Corrupt actors allocate public resources to a shell company and then change the law which multiplies the value of the resources owned by the shell company. After that, the company can be sold to a third party for extra profit. For example, in a well-designed real estate corruption network, 26 multistory buildings were sold in an historic district in Budapest, Hungary (Jancsics and Javor 2012). The falsely undervalued old buildings were transferred by the local government to shell companies, and then secretly controlled by the mayor and his allies. After the local government removed the buildings' historic designations and issued demolition and building permits, private developers bought the shell companies, built office buildings and residential parks and then sold them at great profit.

In contrast to empty shells, live shell companies have real business operations. The main reason for their existence is that their real owners cannot openly exercise ownership in an operating firm, for example, when politicians are legally banned from having a formal position or shares in private business firms. This is usually not a one-time illegal transaction, such as is typical in the case of empty shells, but rather a long-term control over a functioning economic entity. In many live shell cases, the state distributes valuable resources, licenses, concessions, or other monopolistic market positions to a shell company that virtually guarantees profit making. Live shells can be used to build a clientele network surrounding corrupt politicians. For example, in 2013, the Hungarian government turned the previously liberalized tobacco retail business into a state monopoly and then announced a tender for a 20-year concession of tobacco sales (Jancsics 2017). In thousands of cases, people linked to the governing party won tobacco concessions. The official owners and managers of the tender winner shell companies were family members, spouses, siblings, parents, parent-in laws, friends, or even neighbors of politicians, public servants, or politically connected oligarchs. These visible representatives of the shell company acted on behalf of their shadow principal.

## Theorizing Shell Companies

Mainly legal and financial aspects dominate the academic literature of shell companies. So far, the most comprehensive and rigorous empirical research on the topic has studied whether states and corporations comply with international financial transparency standards (Findley et al. 2014). Researchers have found that large numbers of CSPs recurrently violate international standards and surprisingly, CSPs selling shell companies

from tax havens were significantly more likely to comply with the rules than service providers in rich developed countries such as the USA and the UK. However, previous research does not offer a development of a theory.

A possible way to theorize about shell company corruption is to view the phenomenon as a specific form of brokerage (Jancsics 2017; Walby et al. 2017; Van der Does de Willebois 2011). Brokerage is an informal social mechanism by which disconnected or isolated actors can interact. Here the shell company is a vehicle used to effectively navigate between legal and illegal realms. The legal action is implemented by the formal organization yet the visible but fake representative (owner or director) acts as a broker, pursuing the informal and corrupt agenda of its invisible shadow owner. This is a type of mediation where a "representative broker" is delegated by another actor, whether a single individual or a group, to represent its interests and deal with the outside world.

The sociological aspect of the relationship between the broker and the hidden beneficial owner is an important but understudied dimension of shell companies. In the literature, the broker is mentioned by several different names such as front man, straw man, stróman, nominee director, dummy person, stooge, or patsy. Sometimes brokers are appointed by the CSP in order to appear on the public record and to sign the documents placed before them (Obermayer and Obermaier 2016, pp. 14–15). For example, Lu Zhang was, on paper, the director of SP Trading Company but actually worked as a short-order cook at a Burger King in Auckland. She supplemented her income with $15 for each document signed by her for the company. It turned out that SP smuggled weapons from North Korea to Iran (Findley et al. 2014, pp. 1). In other cases, especially in live shell operations, brokers must be trusted which requires some level of social connection between the broker and the shadow owner. Here brokers are typically relatives, friends, current or former employees, or business partners (Jancsics 2017). We can also find unequal power relationship between these two main actors. In this case, socially marginalized people, homeless or foreign refugees are chosen as company owners and directors. They are willing to take huge risks for a relatively small amount of compensation and often fulfill the fall guy function.

## Conclusion

Using shell companies for illicit purposes is a widespread and growing phenomenon. The equivalent of 10% of world GDP is held in offshore tax havens globally. Yet, onshore or domestic shell companies are also heavily used in illegal transactions. The fact that they provide the owner with complete anonymity and at the same time control over the organization makes shell companies especially attractive for corrupt actors. Interestingly, many countries, even those in the developed and democratic West, are reluctant to close this loophole. Scholars are behind in studying and theorizing about the shell company phenomenon. In the next few years, we need more interdisciplinary investigation in order to understand this complex and serious social problem.

## Sick Leave Policies in the Public Sector

Thom Reilly
Arizona State University, Phoenix, AZ, USA

### Synonyms

Public pay; Public sector employment benefits; Paid sick leave practices

### Definition

Paid sick leave is a conventionally accepted part of public sector benefits packages, along with health insurance, pension or retirement, vacation time, and other paid time off.

### Introduction

The prevalence of family leave benefits began to take shape in the 1990s as employers responded to the changing gender composition in the workforce. As more women sought employment outside the home, a demand for work-life balance increased (Ezra and Deckman 1996). The changes in societal values and demographics made family-friendly policies central to an organization's ability to recruit and retain employees. Improving workplace production was a related goal (National Performance Review 1993). Congress responded by proposing the Family and Medical Leave Act (FMLA). The law sought to balance the demands of the workplace with the needs of families, promoting economic security and national interests. It was hoped that family integrity could be preserved while still accommodating the interests of an employer in a manner consistent with Equal Protection Clauses in the Fourteenth Amendment (Public Law 103-3 1993). In general, paid sick leave (PSL) is defined as a paid leave of absence measured in hourly increments that reflects personal illness, doctor or dentist visits, or illness of immediate family members (Rhodes and Steers 1990).

### Paid Sick Leave Policies in the Public and Private Sectors

In 1993, Congress passed FMLA requiring employers to provide job protection for employees seeking leave for child birth, adoption, poor health, or poor health of a close relative. While the Family and Medical Leave Act guarantees protections for certain types of leave, it does not mandate paid leave.

Without a mandate for paid leave, larger employers began to offer paid sick leave and other benefits to further incentivize organizational performance, recruitment, and retainment (Behn 1995). The lack of a unified law on paid leave enables governmental bodies at each level (federal, state, and local) to pursue their own policies regarding paid leave for their employees. This has resulted in a patchwork of programs and policies.

Although there are no federal or state laws requiring that employers in the United States provide paid sick leave (PSL), nearly all full-time public sector employers in the United States receive some form of sick pay. Looking at paid sick leave specifically, public employee access across all levels of government is high. Led by the federal government, which stipulates that all their employees be provided paid sick leave, 91% of all public employees have access to paid sick leave (US Bureau of Labor Statistics 2018). This significantly outpaces the private sector where approximately 70% employees receive this

benefit (US Bureau of Labor Statistics 2018). High level of access to paid sick leave for public employees isn't a new phenomenon. The BLS National Compensation Survey has shown remarkable stability in the last decade as access rates have been hovering around 90% in each of the last 10 years (US Bureau of Labor Statistics 2009a). Private sector policies improved considering their access rates were 61% a decade ago (US Bureau of Labor Statistics 2009b).

## Issues Involving Paid Sick Leave Policies in the Public Sector

PSL is a conventionally accepted part of public sector benefit packages, along with health insurance, pension, vacation time, and other paid time off (PTO). Paid sick leave policy in the public sector revolves around choices that affect access, accrual rate, incentives, restrictions, and cost containment measures. Policy measures pertaining to access seek to control which type of employees receive the benefit (i.e., full-time vs. part-time, management vs. office administration). Accrual rates are defined by an equation that calculates the hours of paid sick leave accrued to the number of hours/days worked. Monetary rewards are often used to both encourage and discourage the abuse of sick leave and to reward employees for not misusing the benefit.

To curb the abuse of sick leave use, governments utilize a two-pronged approach to manage the benefit. To incentivize proper – and limited – use of sick leave, governments offer various programs to address the unused paid sick leave days accumulated over time by an employee. Popular governmental incentive programs include carry-over provisions, use of accumulated sick leave toward pension/annuity service time calculations, sharing programs, and vacation conversion. Carry-over provisions allow employees to keep unused paid sick leave days and roll them over into the next employment year. These provisions can either curb total accumulation at a set amount or allow an employee unlimited accumulation. At the end of employment, policy dictates whether an employee will be paid out for their total unused sick leave or if it will be applied to their service time calculations to impact their public pension or annuity computation. Additional incentive programs allow employees to transfer their unused sick leave. Sharing programs permit employees to transfer unused sick leave to another employee, while conversion programs allow employees to transfer unused sick leave to vacation leave.

Other approaches to curb abuse, often used concurrently with incentive programs, are restrictive programs that stipulate and enforce approved use of the benefit. Approved use can apply to both the frequency of usage and the reasons for usage. Many government programs limit the amount of paid sick leave an employee can use in a calendar month as well as the amount of consecutive days an employee can use. Additional restrictive policies limit approved use of sick leave to the employee's health, a family member's health, bereavement, childbirth/adoption, and veteran disabilities. To confirm compliance with the rules, human resource departments are allowed to request a doctor's note or other documentation pertaining to the employees' reason for leave.

The final area of paid sick leave policy is cost containment measures. These measures address lifetime accrual rates, payout amount and timeframes, and paid leave integration. To limit future unfunded liabilities caused by paid sick leave accumulation, governments are limiting the number of days an employee can accrue over the duration of their employment. Similarly, governments are opting for policies that set a fixed amount of unused sick leave that can be paid out upon termination or retirement, or a policy that pays out unused sick leave annually instead of offering a carry-over provision. Finally, a newer approach has been to integrate all paid leave (sick, personal, vacation). An employee is given a fixed amount of paid leave to which they are allowed to use at their discretion. This approach has gained more popularity in the private sector.

## Benefits of Paid Sick Leave

Access to PSL is critical to the economic security of employees and their families. Absenteeism due

to employee illness can have a significant effect on productivity, morale, and organizational performance. Workers in the United States without PSL tend to work sick and have lower overall productivity (Heymann et al. 2009). Employers face significant challenges in designing competitive and attractive PSL programs for their employees while managing the related costs, administration, and operation of these programs. For example, a major objective of PSL is to ensure that employees stay at home when they have contagious illnesses so as not to pass them on to other employees or customers. Employees going to work sick can be a major public health issue and one driving force of the spread of contagious diseases.

PSL policies are important to the ability of employees to meet the health needs of their children and other family members. Without PSL, parents, especially lower socioeconomic working families, face challenges in making needed doctors' appointments and caring for their children. When parents lack paid sick leave, they are far more likely to send their children to child care and school, which can spread contagious diseases. Further, PSL can have a substantial impact on the finances or employees and their families as on their health. Without PSL, employees are placed at risk economically, experiencing wage and job loss when they take time off to address their health or to provide for family members.

While employers incur costs for providing PSL, they also accrue financial benefits. There exists ample empirical evidence that both monetary and non-monetary programs reduce absenteeism (Reilly and Thom 2015). Employers that offer PSL tend to have lower job turnover rates; lower recruitment costs, training costs, and unnecessary absenteeism; and a higher level of productivity than employers that do not offer PSL (Levin-Epstein 2007).

## Financial Burdens of Sick Leave Policy

While PSL is critical to economic security and health for employees and their families, PSL in many public sector organizations can lead to unexpected costs and potentially significant unfunded liabilities. Employers that offer sick leave must choose whether or not to pay employees for accrued leave upon separation. In many public sector organizations, PSL can be accrued and rolled over from year to year with no limit and either cashed out at termination and/or used in pension calculations. Such calculations are typically performed at the end of the employee's career at their highest rate of pay. In other words, although sick leave may have been earned during years in which the employee had a lower salary, payouts at termination and for pension determinations are calculated at the highest salary levels. For employers that elect to compensate for unused leave time, the cost can be substantial. Many public agencies treat PSL as pay-as-you-go item, which means these expenses are seldom included as fixed items in their budgets. For governments, overly generous sick leave polices can lead to unexpected back-end costs and potentially significant unfunded liabilities. In terms of employer costs, PSL ranks only behind medical and retirement benefits. For state and local governments, the recent recession and the large amounts of unfunded liabilities for pension and other post-employment benefits have placed public sector spending in the spotlight. As many state and local governments struggle to reserve critical services in the face of workforce reductions, they have been under increasing pressure to reduce operating costs.

While an employer may include incentives to reduce presenteeism and/or to control costs, the end result may have the opposite effect because the employer may institute PSL polices that allow employees to accrue and carry over unlimited PSL hours from year to year to reduce presenteeism and prevent a reduction in productivity. However, the employee may be motivated to not use PSL even if they are sick to accumulate hours that they can eventually either cash out or apply toward their pension calculations at retirement. Accrual and unlimited carry-over policies may have the unintended consequences of increasing costs and presenteeism (Reilly and Thom 2015).

Some public entities have enacted cost containment practices and have sought to reform

longtime practices. These include ending the practice of using unused hours to be calculated for retirement, limiting the number of hours employees can accrue per year as well as the number they can carry over, and maintaining sick leave payouts that allow for a nominal or fixed amount to be paid annually instead of accumulating it all until retirement. Other cost containment practices include converting some sick leave costs to wellness expenses and offering programs which give employees a single block of time to accrue various banks of leave for vacation, illness, and bereavement benefits. Work is also occurring in many public agencies to work with employees and their unions to adopt more sustainable, fair, and innovative sick leave policies that incentivize employees to avoid unnecessary absenteeism and benefit both the employee and the employer.

## Paid Sick Leave Policies at the Federal, State and Local Level

### Federal Government Paid Sick Leave Policy

The federal government has a unified paid sick leave policy for all of its employees. Both full-time and part-time employees have access to paid sick leave. The accrual rates differ by employment status. Full-time employees accrue one (1) day of paid sick leave per month of employment (1/2 day per 2-week pay period). Part-time employees accrue one (1) hour of paid sick leave per 20 h in a pay status (US Office of Personnel Management 2018).

Incentive programs at the federal level include unlimited paid sick leave accumulation. The federal government does not pay out unused leave, but it does allow an employee to use it toward their service time calculation. After 2013, employees in either the Civil Service Retirement System or the Federal Employees Retirement System can credit 100% of their unused paid sick leave toward their annuity computation (US Office of Personnel Management 2018).

Restrictive programs at the federal level include limitations on approved usage of leave. Approval is granted for employee health, family member health, bereavement, childbirth/adoption, and veteran disabilities. Agency human service departments are permitted to require supporting evidence for the use of sick leave including doctor's notes or documentation of relationship if used for a family member's health.

### State Government Paid Sick Leave Policy

Paid sick leave for state employees is nearly universal. Forty-nine out of the 50 states offer paid sick leave to their full-time public employees; the only state without paid sick leave is Alaska – which offers an integrated paid time off policy. Accrual rates vary between programs with states offering rates as low as 5.6 h of paid sick leave per month to as high as 10.4 h per month. Lifetime accumulation totals vary between the states as well, with 70% of states allowing unlimited accumulation and 30% setting a cap. Of the states that cap lifetime accumulations, those limits range between 45 days and 180 days.

The use of incentive programs is prevalent in state policy. All states have at least one incentive program regarding unused sick leave totals. Most states choose to pay employees out in a lump sum at the end of employment (64%). There is a lot of variance inside each state policy in how that is enacted. States employ various cost containment measures like only paying out employees that are eligible for retirement, only paying out a set fraction of unused leave, or setting a maximum lump sum amount. States use a fraction rate as low as one-fourth and as high as one-half for payouts, and of the states that choose to limit the payout to a set dollar amount, those rates range between $2,000 and $15,000. Furthermore, about a third of states allow employees to apply unused sick leave toward service time credits to boost retirement computations (30%). These programs are subject to variance among the state policies with states putting cost containment measures in place that limit either the total amount of service time you can gain or limit the number of unused sick leave days that can be applied.

Sharing and conversion programs aren't as popular in state policy. Only 40% of states offer a sharing program. This number might be low as

sharing programs exist inside department policy and not part of state policy. Conversion programs tend to be very rare with only three states offering the opportunity to transfer unused sick leave into vacation leave (6%).

States' use of restrictive programs is universal. All states have set circumstances that define approved use of sick leave as well as the authority to require documentation to substantiate the reason for use. The policy surrounding documentation varies slightly as some states require documentation after three consecutive days of absence, while others require it after five.

### Local Government Paid Sick Leave Policy

Local governments, both city and county, have a much less unified approach in the types of paid sick leave policies enacted. The significant factors determining variance in paid sick leave policies at this level of government are collective bargaining status, the type of local government (city vs. county), and if public hearings were allowed for the adoption of benefits (Reilly and Thom 2015).

Similar to federal and state government employees, access rates remain very high for local government employees (91.7%). Conversely, incentive programs are far less likely at the local level than at the federal or state level. About half (53.9%) of surveyed local governments reported paying out employees for unused sick leave upon termination or retirement; even fewer (39.9%) reported allowing unused sick leave to be counted toward service time for pension/annuity computations (Reilly and Thom 2015). Similarly, less than half (42.1%) of local governments reported the availability of sharing programs, and only a handful (13.1%) have a policy in place that allows employees to convert unused sick leave into vacation leave (Reilly and Thom 2015).

Policies enabling restrictive programs are common in local governments. A majority (70.1%) of surveyed local governments reported the ability to request a doctor's note to confirm appropriate use of sick leave, while a little over a quarter (27.6%) audit the usage of their employees' sick leave (Reilly and Thom 2015).

## Conclusion

Absenteeism due to employee illness can have a significant effect on productivity, morale, and organizational performance. Although there are no federal or state laws requiring that employees in the United States provide PSL, nearly all full-time public sector employees receive some form of sick leave pay. PSL policies are an accepted practice in the public sector and are recognized as important in meeting the human resource needs of employees and their families as well as the health of the organization.

# Silver Tsunami of Retirement: Implications for Consideration

Francesca Flood
Hope Verdad, LLC, Lake Frederick, VA, USA

## Synonyms

Baby boomer

## Definitions

| | |
|---|---|
| Sandwich generation | Double burden of caring for parents and children at the same time. |
| Golden years | The time of life after retirement from active work. |
| Baby boomer | Those born 1946–1964. |
| Gen X | Those born 1965 to 1980. |
| Millennials | Those born 1981–1996. |
| Gen Z | Those born 1997–2005. |
| Collectivistic society | It has to do with political theories that put the group before the individual. |
| Individualistic society | Characterized by individualism, which is the prioritization or emphasis of the individual over the entire group. |
| Identity stability | A stable sense of identity means being able to see yourself as the same person in the past, present, and future. |
| Ageism | The inferior treatment of older adults. Depending on the age asked to define when a person is "older," the range is from 59 to 73 years old. |

## Introduction

With the generational changing of the guard, billions of individuals around the world have or are ready to transition into retirement. Given the record number of these individuals, we are facing a global silver tsunami of retirement and aging. According to the United Nations, the number of those over 60 worldwide is expected to double by 2050 to 2.1 billion. In the 1950s, that segment of the world's population was around 205 million. With large numbers leaving the workforce and longer life expectancy, there are myriad implications to consider including the psychological effects of retirement, a new global retirement model, and creating policies to manage an aging population. While cultural differences exist between countries, all are grappling with the implications of a retiring workforce and aging population.

This phenomenon requires an examination of the potential implications of mass retirement at the individual, community, and societal levels. While retirement is often viewed as an individual event, the mass exodus of a population segment coupled with a rapidly aging population may present a larger ripple effect on those who remain in the workforce, public programs, and society at large. Moreover, attitudes on aging and ageism require examination as a greater percentage of the global population grays.

As large numbers of workers retire from the public sector of governments, private corporations, and various organizations, such exodus may create a knowledge gap. Moreover, retirees are living longer increasing demand on health care, social systems, and requiring greater financial resources. The next in line generation will

inherit not only the workplace landscape but may increasingly find role reversal having to care for elderly parents and/or grandparents while confronting an economic drain on public programs and healthcare systems. The aim of this paper is to provide a high-level discussion regarding the implications of a retirement tsunami and encourage further examination.

## Background

Except for Latin America, North Africa, and sub-Saharan Africa, the graying of society is occurring across the globe. The baby boomer generation (born 1946–1964), though globally referred to by different names is not a unique phenomenon to the USA, North America, and Australia. Indeed, while the boom began later in Europe (EU) lasting into the 1970s, the EU has the largest population in this age group. Likewise, although Asia's aging population is more attributed to family limitations dictated by culture and governmental policy, there are more older people than younger (Rosenberg 2011). "The United Nations estimates that between now and 2050, the share of the population aged 60 and older will increase in every country" (Scott 2018, p. 1).

Although decades of generations have been counselled to financially prepare for retirement, many postpone what they think is a far in the distance event, while others may not possess the financial literacy or means to do so (Aegon 2018). Beyond financial ill preparedness and its subsequent public burden, a knowledge gap may form when a generational knowledge base exits the workforce without transferring this information to the next generation. As life expectancy increases, this aging population is living longer with fewer people to contribute to the public support systems for retirement. Global demand for health care will increase with fewer service providers to handle this increased population segment (Garza 2016). On top of these issues are the existential questions/crisis many retirees will be confronting as they leave behind their work and/or purpose in life (Amabile 2019). As the world moves through the twenty-first century, it is confronting a tsunami of aged persons and the subsequent issues associated with them.

## Individuals: The Microlevel

It is hard for many 20- to 30-year-old individuals who are beginning careers, raising families, and struggling to meet current financial demands to enthusiastically embrace the concept of saving for retirement. It is a far-off notion and the existing drain on financial needs seemingly dampens the need or desire to save for that futuristic event. For many moving into their 40s, the idea of retirement begins to enter their intellectual framework (Adamczyk 2019). Still, in this age group many are struggling to help their children move through university or accommodate the gap of employment of adult children who return home. Additionally, unlike collectivist cultures where caring for multi-generational families has always occurred (Leake and Black 2005), many in individualistic cultures now find they are part of what has been termed a "sandwich generation" where at midlife they have a double burden of caring for parents and children at the same time (Vitelli 2015).

Globally, individuals have been admonished for decades to plan and save for their golden years (Aegon 2018). For the retired, there is a universal hope that they do not outlive their financial resources. Indeed, many have insufficiently prepared their retirement funds and either outlive their money, live frugally, or in poverty (Aegon 2018). Worldwide the retirement age varies slightly from country to country with an average range of 60 to 70 years old (Love Money 2019). However, in many postindustrialized and industrial nations, this age is creeping upward. While financial need may be a driving force behind this increase, an existential crisis may also be a contributing factor (Zulkarnain and Rutledge 2018).

Financial preparation for retirement has been a consistent cautionary tale for workers worldwide. However, less emphasis has been placed on meaning in life post-work and preparing for this transition. This is especially relevant for individuals who have a strong identity with their professions. Without a plan for one's daily routine and mission, an

existential crisis can develop, leading individuals to struggle to find their relevance and place in the world (Vaugh et al. 2016). Despite having achieved financial security, many have decided to continue in their life's profession to retain a sense of purpose (Amabile 2019).

Although health and wealth are important antecedents and consequences of retirement, we have yet to fully examine the psychological and emotional identity stability and life satisfaction implications individuals confront as they face retirement (Amabile 2019). However, without careful, advanced consideration and planning for one's postretirement chapter of life, some may find themselves confronting an existential crisis. Individuals who enter into this "void" were more disposed for cognitive decline and depression, while those who postponed retirement, reduced the 5-year mortality risk by 32% for men in their early 60s. According to Zulkarnain and Rutledge (2018, p. 3), "Working longer is associated with lower mortality, depression, and diabetes risk for both men and women in ordinary linear regression models." Having a purpose or meaning in life cannot be overstated. Decades of studies on meaning in life posit that such presence signals well-being, altruism, strength, resiliency, personal growth, as well as the biological benefits of reduced stress hormones (Steger 2012).

According to a study by Aegon (2018), when individuals were asked about retirement aspirations, the most common responses included traveling, spending more time with family and friends, pursuing new hobbies, and volunteerism. Individuals who anticipated working past retirement age were doing so because they both wanted and needed work. Globally, Aegon (2018) found that 56% of respondents desired to continue with employment because it keeps the brain active and alert, while 37% stated they simply enjoyed the work. In a separate study, George (2014) reported that workers stay on longer because they feel appreciated, have positive relationships with their colleagues, feel challenged by their job, and believe their work is important and has purpose.

Though many persons will leave their job without emotional or mental conflict, those who engage in some form of identity bridging, that is maintaining or continuing their preretirement identities as they transition, fare better in psychologically detaching from their work. Moreover, those who found new occupations, whether paid or volunteering that utilized work experience, knowledge, and skills fared better in post-retirement transitioning. Likewise, those who shifted attention from work-related matters to fostering strong, supportive social networks also experienced better transition into retirement (Aegon 2018).

Of all age groups, older men have the highest rate of suicide globally. Reduced functioning, lack of belongingness, and feeling a sense of burdensomeness are contributing factors (Ruifeng and Fiske 2020). Baby boomers have the highest rate of depression compared to all other living generations. This may occur as a result of life changes where confronting financial pressures and social changes are manifesting. As baby boomers reach middle age, suicide has become more prevalent (McCarthy 2015).

According to Smith (2017), when individuals believe the only thing that gave their lives value was gone, they fell into despair, convinced they were worthless. Financial independence offers more security, lifestyle, and freedoms. Yet in addition to or beyond financial means, the aging workforce desire to move on to their next chapter in dignity, respected, valued, and with as much independence as possible (Azulai 2014).

## Community: Mezzo Level

In the USA, baby boomers who are leaving the market in record numbers own 2.34 million businesses employing nearly 25 million people. This translates to 25 million families or approximately 100 million people (one third of US population) who will be affected by this retirement migration. Yet nearly 58% of these business owners have made no transition or succession plan (Sherman 2019). Beyond the direct impact to these employees is an interconnected web of vendors, suppliers, independent contractors, and others who work with these businesses, many of which are owned by Gen X, Millennials, and Gen

Z. Without proper planning, the erosion and disappearance of these business owners will at least in the short term, leave employment and financial gaps across the business landscape. In the European Union, an aging population is creating a workforce that is graying and shrinking as businesses work to prolong productivity from this population (Chand and Markova 2019). Few communities have been exempted from this aging workforce, and many are working to mitigate the challenges.

Organizational knowledge and experience are seldom archived in records. Long-term employees are typically the repository of this knowledge and history. Moreover, borne from this experience comes the capacity to make effective decisions based on lessons learned. These skills are rarely immediately transferrable as the baby boomer generation retires. Organizations have failed to document the "tribal knowledge" or "stuff in people's heads" and create succession plans (Eisenberg 2019) or to put a knowledge transfer plan in place (Norberg-Johnson 2018). Such knowledge can be categorized as intellectual property having an intrinsic value and will be lost with employee departure. There is a systematic failure by organizations to capture this critical knowledge and appreciate the value of these individuals who are repositories of knowledge (Eisenberg 2019). When baby boomers retire en masse, vacancies will rise without enough workers to fill them. This will create more demand increasing wages to attract the necessary replacements.

An often-overlooked aspect of retirement is whether individuals want to retire, are ready to retire, or are being forced to be retire by an arbitrary age. In some professions such as commercial airline pilots, judges, air traffic controllers, and others, retirement is mandatory at a set age regardless of the person's cognitive, physical, and/or technical abilities to continue the work (Locsin 2017). Such forced retirement is based on a numeric metric rather than the individual's ability to pass physical and proficiency exams and may lead to a loss of skilled and experienced talent. While individuals may have reached a predetermined mandatory age for retirement, this does not mean they are financially prepared for retirement. Communities would do well to recruit this talent and utilize these skills whether through volunteerism or flexible employment (Aegon 2018).

Whether retirement is voluntary or mandatory, many of these departing employees have a willingness and desire to mentor those who will assume their positions and some organizations that have recognized the value of this intellectual property have begun to incorporate knowledge transference into their retirement transition. Companies such as Duke Energy, Siemens, General Motors, and Michelin North America have developed mentor programs aimed at transference of this institutional knowledge as well as archival systems where current employees can access this information (Eisenberg 2019). Organizations are establishing incentive programs aimed at enticing experienced workers to transfer the knowledge acquired during their careers to younger employees (Agovino 2018). Yet while aging employees would like to stay employed and transition to new positions, have flexible schedules, or reduced hours, only a small percentage of companies are prepared to offer these options (Agovino 2018). With the mass exodus of baby boomer retirement, a greater emphasis needs to be placed on retaining key personnel to mitigate the loss of essential skills, competencies, and historical knowledge. Such retention of professional workers has been noted in high performing organizations (George 2014).

## Global: Macro Level

As never before, the world's population is aging rapidly. Older individuals represent a larger percentage of the world's population which will increase over the next century. The rapidity of this changing demographic will create unique challenges globally, regardless of a nation's economic status. Heathcare demands, shortage of labor supply, and economic growth will be challenged causing financial and social consequences. Expanded aging translates to increased illnesses such as dementia, Alzheimer's, Parkinson's, and other diseases associated with the aging process

that will create increased burden on systems already taxed (Bloom et al. 2015).

Globally, the economic, social, and medical consequences of an aging population are pervasive. Every nation, despite its cultural differences is confronting the challenges of an aging workforce and population. Addressing the challenges will require international cooperation as one nation alone will not be able to remedy the issues (Challenges of an Aging Global Population 2016). With an aging population and decreased birthrates, countries around the world must reassess their respective retirement systems to ensure benefits will be available to future retirees (Robertson 2018).

Financial responsibility for retirement is quickly shifting from governmental agencies and employers to the individual level. The traditional expectation for long-standing certainties of lucrative governmental pensions is deteriorating as life expectancy increases (Aegon 2018). Additionally, the increasing number of aging people will require more intense, complex, and expensive health care over the next 20 years, while the number of younger- and middle-aged workforce that underwrite these costs are not keeping pace. As the aged population increases, there are fewer working bodies to underwrite the delivery of the medical system, and the needs of this population will differ from those in the past 30 years (Mitchell 2014).

The tsunami of an aging population will force healthcare leaders to rethink their delivery model to realign resources. This growing number will affect the global healthcare system impacting providers, hospitals, pharmaceuticals, device manufacturers, government, and others within the industry. The changing demographic landscape will require a clear strategic vision to match resources with heightened demand (Mitchell 2014). Moreover, as organizations work to retain the talent base of older employees to stay longer on the job, if not adequately addressed, a knowledge gap will form between exiting staff and current employees (Eisenberg 2019).

In many countries across the globe, prejudice and discrimination studies surrounding racism, sexism, and sexual orientation discrimination have increased. However, while a large segment of the global population is aging, ageism, although a real phenomenon, has not received commensurate attention or study. Ageism is typically directed at older adults with inferior treatment. Ageist attitudes and beliefs often result in behaviors that discriminate and socially exclude people based on their age (Azulai 2014). Such exclusion and stigmatization negatively impact the well-being and quality of life of those targeted (Corrigan 2004). Ageism discriminates against older adults based on beliefs that older persons are aesthetically impaired, have reduced cognition, are less sexual, and no longer a productive member of society (Wilkinson and Ferraro 2002).

Discrimination against the aged has become socially acceptable, particularly in the USA. However, evidence of pan-cultural ageism is emerging giving way to the once held revered status of elders. According to Cuddy et al. (2005), the prevalence of ageism once believed to be unique to American culture is far more pervasive. Collecting data from six countries, the authors concluded that ageism and elderly stereotyping are consistent across multiple cultures, suggesting pan-cultural ageism. In the younger population across the globe, the existence of ageism has been revealed with society viewing older people as less valued, lower status, and noncompetitive (Wilkinson and Ferraro 2002).

A recent incident by a New Zealand lawmaker stating, "Ok Boomer," to a fellow, older lawmaker who was heckling her brings to the fore that the divide between generations in the workplace is real. Whether it is the baby boomers' inability to transition into retirement, not wanting to step back to a mentor role, or refusing to pass the torch, the perception of the next generation is that they are ready to take command (Noguchi 2019).

As societies age, people are living longer remaining more productive than previous generations. A consensus is building that today's 75-year-old is equivalent to a 65-year-old in the 1950s (Scott 2018). However, though older people may be aging better than their ancestors, a lingering bias in some cultures of ageism remains, and new ones are emerging. The intersectionality of ageism and working older adults creates problems both socially and in the workplace. Yet despite the concern of

ageism, there is hope that the generational divide can be bridged. When asked whether knowledge transference is welcomed, many Generation X (born 1965–1979), and Millennials (born 1980–1994) appreciate conversation with their older cohorts (Eisenberg 2019).

Governments have been gearing up for old-age dependency resulting in less economic growth and greater reliance on healthcare and public budgets for financial assistance (Scott 2018). The idea of mass exodus by the older workforce creates a fear of economic downturn, diminished productivity, and placing a strain on available resources. Delaying retirements for these workers could affect postretirement standards and sustain an individual's role and purpose in society (Norberg-Johnson 2018). The World Bank stated that generous retirement benefits are not financially sustainable and recommended reforms (Robertson 2018). When combined with individuals having insufficient funds to last through end of life, the results could be catastrophic. Retirees would need to make major lifestyle adjustments involving nutrition, health care, and other factors (Friedberg 2019).

In nearly every country, policymakers, employers, and people in general are struggling with the implications of an older population and retiring workforce. Though cultures are diverse, and the inner workings of a retirement system may differ, there is consistency in the challenges, and problems society will confront (Robinson 2018). Globally, a new retirement model that creates greater financial literacy, retirement savings for workers, affordable health care, and other solutions will need consideration to address the current aging population and future generations (Aegon 2018). To confront these challenges, thoughtful policy programs need to be implemented more sooner than later. Countries can initiate new policies and implement institutional reforms aimed at ameliorating the potential loss of knowledge, economic burden, existential crisis, ageism, and other challenges associated with an aging population. Such reforms are needed to divide costs among these generations and to create a smoother transition as one generation passes the torch to the next (Bloom et al. 2015).

## Conclusion

As the tsunami of retirement and aging covers our globalized world, there are many implications which will require consideration and this paper touched upon a few. Solution which may mitigate the challenges we will confront exists. Shortages in labor supply may be reduced by encouraging immigration, women in the workforce, and retaining older employees. The combination of these initiatives would not only address talent requirements but create a more diverse and broader knowledge workforce. For the first time in history, our workforce spans five generations. Our focus should not emphasize the differences between these generations but seek to find common ground.

Education about ageism must be implemented and discrimination must be addressed. By changing perceptions about aging individuals, not only does their well-being and quality of life improve but society benefits overall. It is time to take a positive view of aging that recognizes the value of older individuals and takes full advantage of the knowledge and experiences borne of their longevity. Older workers represent a repository of knowledge, experience, and provide value through the transmission of these assets to the next generation.

The longevity of those collecting funds is placing a strain on social financial safety nets such as government pensions. The dichotomy of wanting older workers to retire is that they will collect the very benefits many public institutions are struggling to pay. Instead, by lengthening careers, these workers continue to pay into social funding with less benefits paid out. For many, achieving 65 years of age, no longer means automatic retirement as they cannot afford to stop working. To this end, we may need to rethink our definition of retirement. Rather than seeing it in absolute terms of working and not working, perhaps it is a spectrum of transitioning. Social partners in the academic community, various charities, and industries need to work more closely in public-private sectors to collaborate, innovate, and share best practices on new policies.

The implications to consider with mass retirement are many and varied. This paper reviewed some of these at a high level to encourage further thought and provoke more study. By allowing willing and able persons to continue their contribution to society, we address the need for relevancy and decrease the draw on governmental assistance with many deferring payouts. Moreover, when seniors are allowed and encouraged to continue their work, even if at a reduced schedule, the overall production of economy gets a lift.

## Skill Requirements for City Administrators

Thomas Lynch
City of Norwalk, California State University East Bay, East Bay, CA, USA

### Synonyms

University

College graduates in Public Administration and Business Management often graduate from the university with aspirations of advancing their career in public service. Their intention is to apply their technical knowledge to improve the operations and efficiencies of their chosen organization. They believe that building expertise in the technical arena is a pathway to advancement. However, development of additional skills is necessary to achieve organizational success. These skills must be finely honed and suited to the challenges of today and the future.

Broadening skill levels builds confidence in oneself and, just as importantly, improves one's ability to manage others. An administrator needs to be able to adapt to change, collaborate successfully, deal effectively with problems, and become more valuable to the organization. A competent administrator has responsibility for project accomplishment, the accomplishment of others, and must live within limited resources, funding, and time. Each of these objectives requires building proficiencies in the following areas:

*Communication* – Effective administration relies on clear communication to gain commitment from employees, achieve organizational goals, and support from the community. Clear and accurate communication plays a pivotal role in information sharing. Formal communication can occur verbally, or by writing, and even through the less formal means of e-mail, the Internet, and social media. Listening is equally important to assure everyone is working toward the same goal. Cooperation can be enhanced through active efforts to insure communication is perceived as being two-way, where all ideas can be expressed, recognized, and are valued. This builds trust for all participating parties involved.

*Collaboration* – Working to address problems and finding solutions is enhanced through collaboration. A collaborative environment improves information flow, resources, knowledge, time, and effort. It allows roles and responsibilities to fluctuate and evolve. In more traditional hierarchies, the administrator is often the arbiter when conflicts develop within an organizational setting. Conflicts can be resolved with greater cooperation by brainstorming with a team. It allows for open suggestions, different perspectives, and unique insights. Leadership becomes a shared role and responsibility.

*Time Management* – Planning and exercising control over the amount of time spent on activities improves effectiveness, efficiency, and productivity. It usually is aided by setting deadlines, priorities and goals, and often provides incentives to ensure adherence to deadlines. A team effort is assisted with a delegation of timely responsibilities. By prioritizing activities, the relative importance is clarified and assures the appropriate amount of time is spent on the right activity.

*Building Interpersonal Relationships* – Building rapport builds relationships. Many team-building exercises focus on making effective working relationships. It helps to align people around organizational goals and builds teams to explore and find solutions. It also demonstrates a higher level of respect, recognition, and value of the team relationships.

*Delegation* – An administrator is expected to delegate. This assists the manager by relieving duties and activities that can be accomplished by others and provides opportunities for growth of subordinate personnel. It pushes accountability, responsibilities, and decision-making further down into the organization. By transferring this authority, it also eliminates micro-management by superiors. Delegation builds skill at all organizational levels and motivates all employees. It broadens authority, and develops stronger and more thorough decision making.

*Hiring Personnel* – Many managers and administrators make the mistake of building an organizational team by surrounding themselves with people that think and act just like them. They believe that a common or similar managerial style promotes organizational harmony. They feel that personnel compatibility is necessary to achieve the organizational goals. They couldn't be more mistaken. Common managerial style overlooks the values of alternative perspectives. Style differences can improve and expand the development of options and alternatives. Different viewpoints within the team are critical and necessary when it comes to problem solving, negotiations, projecting future opportunities, meaningful collaboration and bringing new ideas to the agency.

*Forward Planning/Forecasting/Noting Trends* – Changes in the economic climate at the local, national, and even the international level can result in impacts to a local community. New technology, business or corporate decisions, and economic and social change can occur quickly. Local businesses can close, downsize, or relocate, which can change the support of tax base or employment of local residents. Conversely, businesses could be looking for possibilities to grow and expand. Quick and effective response to business interests can assure protection of local resources and securing opportunities for community growth. Attention to trends can provide significant advantages in keeping a community healthy. Think about the bigger picture.

*Problem Solving* – Developing a methodology, process, and team to address problems are the key to successful solutions. Problems can arise in a variety of forms. They can impact an individual, group, organization, or the entire community. Anticipate there will be problems and that people will turn to the government and its administration for help with a solution. A team approach involving public and private interests will provide a broader resource for options to address these problems. Effective problem solving takes on issues purposely and incrementally, to breakdown components that can be dealt with managerially.

*Effective Negotiating* – Many negotiations fail because negotiators attempt to win by having their opponents lose. Fact finding is the first step in defining and addressing a goal. Approaching negotiations with a goal or outcome being a win /win has a much higher possibility of success. Both sides to a negotiation can then claim success. Future relationships and further opportunities follow win /win negotiations.

*Administrative/Critical Thinking* – Reasoned judgment takes into account the larger picture. Critical thinking focuses on problems, to first prioritize, and then find workable methods to meet the problems. It is the application of logic to provide clarity, accuracy, and depth to understanding. Critical thinking is considered important in all endeavors because it enables one to analyze, evaluate, explain, and restructure their thinking

and thereby decrease the risk of adopting, thinking, or acting on an erroneous belief.

*Leadership and Employee Motivation* – Team building and power sharing are replacing the more traditional top down organizational structures. The evolution is toward a collaborative approach that empowers all employees to be creative and participative in setting organizational objectives. The most effective way to develop and empower employees is to ensure that learning is an integral part of their work. The workplace environment needs to foster competency, a level of autonomy, and a feeling of connection.

*Visibility and Transparency* – Communities expect for their leadership to be visible and accessible. Visibility helps lessen formality and encourages community support. Visibility can be enhanced by having administrators available at community gatherings and assemblies. Visibility within the organization is also desirable. All public agencies are required to be transparent, and transparency builds trust. Responsibility to the public requires a reasonable degree of disclosure to which agreements, dealings, practices, and transactions are open to all for verification.

*Mentoring and Coaching* – New employees and advancing employees need coaching. The expectations for performance need to be expressed clearly and concisely. Employees need to know who and where to turn to if problems or confusion arise. The better mentoring relationships involve professional advice, disclosure of organizational experience, and the exchange of a particular body of knowledge that helps the new employee quickly come up to speed as a contributor within the organization. Mentoring helps the employee navigate the learning curve inherent in any new role, and teamwork is paramount. Accomplished administrators often work closely with fellow managers through professional networking, to call upon peers for additional advice and support.

*Finance and Budget Management* – All administrators are expected to prepare budgets and manage them effectively. The budget sets parameters and limitations for organizations and projects and needs to be broadly understood by the entire team. Categories of expenditures need to be adhered to, meeting the requirements of the funding sources. Regular review of expenditures to-date can help assure funds are appropriately allocated. Exploration of additional or supplemental funding sources, particularly for capital projects should be a regular exercise for all managers. Partnering and cost sharing can also be an effective way to stretch limited resources.

*Project Management* – Project management focuses on the temporary or nonpermanent endeavor, designed to produce a unique project or service, and is limited by a specific budget. It includes planning, executing, and controlling all aspects of the planned undertaking, including the entire team involved in the work. It is also the proving ground for managerial advancement in an organization. The skills involved include team building, budget management, scheduling, negotiating, collaboration and communication.

*Reward Performance* – Acknowledging a job well-done can be a great motivator for individual performance, and the organization as a whole. It encourages and formally recognizes accomplishments, and lets the other team members know that the organization values individual and collective efforts, and project achievement. It also affirms and validates the broader organizational mission and goals with each employee. Success needs to be celebrated.

*Strategic Thinking* – Can be undertaken by an individual or a team looking at opportunities to create a competitive advantage for an organization. It is often applied to areas of growth and economic development in fast changing business environments. Most managers are required to look at a distant horizon to anticipate future needs and the interdependence between the organization, community, and the region.

*Political Sensitivity* – A city administrator reports to a legislative body. The legislative body acts as a body, not as individuals. The collective legislative body guides the organization's policies, not the management of the organization. Management must be cognizant of the elected legislator's agendas and assist in the achievement of the policy maker's goals. A legislative body selects the city administrator based on their capacity to lead a management team, and work to clarify

and implement policy direction. They may desire more emphasis in entrepreneurship, or sustainability. The legislative body may have individual objectives, and may want to stress more importance in certain areas, but it is up to the administrator to find their common thread. Many political goals may not make logical sense, but a savvy administrator must work and stay vigilant to understand the motivations behind these goals and incorporate this understanding in preparing a managerial path.

*Positioning for Opportunities* – Anticipating future market demand, community interests and needs, new technology, development of new skill sets for employees, changes in law, environmental impacts, and related development places an organization at a distinct advantage in being in the position to take advantage of possibilities. A new highway, evolving technology, a new company, a change in environment, and new methodologies can open doors of opportunity for a community to take advantage of.

*Volunteering* – Benefits connected with volunteering are extensive both personally and professionally. It is especially helpful early in a career to build skills in connecting with others, solving problems, and strengthening communities. It improves one's social activity and provides a sense of purpose. It can also boost career options, by illustrating commitment, dedication, and interest.

Each of the skills outlined above have no specific priority. They all come into play in effective and responsible administration and management. Fulfilling the role of city administrator will vary by the organization and community's needs being served. Many cities share common problems of revenue generation, housing, public safety, deteriorated infrastructure, inadequate transportation, social services needs, etc. All cities are at different stages of development. An older community, with little or no vacant land, and no room to expand, face different challenges than cities with large undeveloped acreage. Yet the goals of economic stability and sustainability may be the same. However, the solutions are different. Organizations constantly transform and evolve. Urgencies and priorities may change quickly and require the concurrent application and blending of several of the skills outlined above. If an administrator practices and hones these skills, employee and community support for the collective effort will grow.

# Skill Requirements for City Administrators, Russia

Evgeniia Kutergina, Anna Sanina and Valentina Kaysarova
National Research University Higher School of Economics, St. Petersburg, Russia

**Skill requirements** are the competencies which are necessary for the proper performance of professional duties. These are abilities and knowledge that an employee has to have to cope completely with work tasks.

## Introduction

The study of city administrators' skills is of current importance nowadays (Reddick and Demir 2014; Hewins-Maroney and Williams 2013; Leighninger 2010). The question remains unresolved as to what set of skills, knowledge, and personal qualities city administrators must have. This article is devoted to studying of the peculiarities of city-level officials' professional activity in Russia, namely, the relevant competencies comprising the base of their specialties. The state's recently increased determination to standardize the sector of employment has been reflected in development of professional codes for many professions. But government and municipal employees are practically excluded

from this process. At the present moment, there is no universal, adopted, and statutorily legitimate list of requirements to the skills of administrators at any level of the governmental power in Russia. Therefore, this article is based on the recent empirical study of activity characteristics of the city administrators' profession (Kutergina and Sanina 2017). The study is based on the competencies from the educational standards in state administration and on the current government employees' attitude to them. Also, the study is based on a representative survey of civil servants ($n = 401$) and municipal officials ($n = 333$) in Saint Petersburg. The data on the population (the number of state government bodies' and local governments' employees) were obtained from the website of the Federal State Statistics Service (Rosstat 2015). The methodology of this study includes action analysis of competences from educational standards of Masters of Public Administration and their transformation into descriptors of bureaucrats' activities, survey of Saint Petersburg civil servants, and SPSS analysis. As a result, knowledge and skills that are prior for the current city administrators and are unimportant in their daily activities were identified.

The position category composition was the following: specialists (63.8%), heads of government authorities (23.5%), heads' advisers (6.5%), and providing specialists (5.9%) (in Russia, there are four position categories of government officials: heads of government authorities, heads' advisers, specialists, providing specialists). 35.5% of participants were between the ages of 41 and 60 years, 26.5% between the ages of 31 and 40 years, 23.8% between the ages of 26 and 30 years, and 11.6% under 25 years. Most government officials were women (76.1%).

## The Most and the Least Required Skills

The vast number of city administrators (85%) believes that professional activity of a civil servant is impossible without evaluating the consequences of decisions made and ability to take responsibility for them (Table 1). Consequently, the level of professionalism of government officials needs to be high to make competent decisions that impact directly the lives of the citizens.

**Skill Requirements for City Administrators, Russia, Table 1** The most required skills of city administrators

| Skill | Percent of respondents that assessed the skill as an unclaimed in the public service |
|---|---|
| 1. The ability to evaluate the consequences of decisions made and to take responsibility for them | 84.6 |
| 2. The ability to take actions in accordance with professional ethics | 77.1 |
| 3. The ability to make decisions on the base of the knowledge of the regulatory framework | 72.9 |
| 4. The ability to search and verify the information | 68.7 |
| 5. The ability to analyze and structure the information | 67.8 |
| 6. The ability to work in teams | 67.3 |
| 7. The ability to manage the document flow | 66.8 |
| 8. The sense of public duty and social responsibility | 65.5 |
| 9. The ability to interact with citizens and communities | 64.4 |
| 10. The ability to rely on the received public service experience | 63.2 |

Seventy-seven percent of city administrators are sure that decisions should be made in accordance with the requirements of professional ethics. Interestingly, the knowledge of the regulatory framework has third place in the list of the most important skills of public administrators (73%). Therefore, according to the opinion of city administrators, city managers should first think about the possible consequences of their decisions and about professional ethics of the actions and then take into consideration existing regulatory framework to make planned decisions.

Modern processes of informatization have left a significant imprint on the ranking of the most

required skills of civil servants. It is important for city administrators to be able to search, analyze, structure, and verify the information (67%). Indeed, officials have to work with large amount of data. At the same time, only the half of the respondents (53%) said that the skill to be able to use modern information, communication technologies, and technical means is an essential one in the civil service. It was expected that the ability to use communication technologies would be important at the same extent as the ability to analyze and structure the information. We can assume that most government officials have to analyze the information by themselves rather than with the help of ICT. Therefore, paper-based governance remains along with electronic governance in Russia.

It was predictable that among the most required skills would be such skills as the ability to manage the document flow (68%), to work in teams (67%), to have a sense of public duty and social responsibility (66%), and the ability to interact with citizens and communities (64%). Interestingly, that in the list of the most required skills of city administrators, there is the ability to rely on the received public service experience (63%).

The number of city administrators at different levels of power that put the same importance of mentioned skills varies slightly (from 0.2% to 4.3%). In other words, mentioned skills are assessed almost equally by federal, regional, or municipal civil servants. At the same time, there are secondly required skills that groups of city administrators had not assessed equally. For instance, there is different importance for city administrators of such skills as the ability to constructively defend personal point of view, to expand the cultural and professional outlook, to develop yourself professionally and personally, to evaluate alternative solutions to problems, and to choose the best.

An interesting trend is how city administrators assess the ability to constructively defend personal point of view. The majority of federal officials (40.8%) believe that this skill is generally useful, but is not paramount for them. The half of the respondents at the regional level of power noted that this skill is essential. 60.5% of municipal employees had the same opinion. It turns out that the higher the position of government institution in the vertical of power, the lower the significance of such skill.

The same trend is observed in a number of skills evaluated by federal, regional, and local civil servants as paramount. The trend is that the lower the position of government institution in the vertical of power, the lower the number of officials who gave such a high evaluation of the skill. Among these skills are the following: organizational skills, the ability to find compromise solutions on professional issues, the ability to choose alternative solutions to problems, and the ability to organize the process of implementation of the decisions.

A similar trend is observed considering the ability to expand your cultural and professional horizons and to develop yourself in professional and personal terms. That is, more than a half of municipal civil servants (62.5%) indicated the prime importance of such skill, while only 43.4% of federal government employees consider that this skill is essential in public service. Forty-eight percent of regional city administrators believe that this quality is definitely useful, but it is not paramount. It was unpredictable to explore that this skill could be assessed differently at federal, regional, and local levels of power. It can be assumed that municipal city administrators are more concerned about professional and personal development.

The opposite trend is observed regarding the ability to use the methods and means of analytical work. More than a third of respondents of federal level of government (43.3%) assessed the high importance of this skill. Approximately the same amount of city administrators at the local level of government marked the same strong importance of this skill (39.9%). 38.8% of regional civil servants evaluated the ability to use the methods and means of analytical work as of the secondary importance. It remains unclear why regional civil servants assessed this skill lower. Perhaps this is due to the fact that among respondents from the group of regional city administrators, the majority takes the position of assistants (advisors) (33.3%). It is known that city administrators of his category

position have more administrative work than analytic.

However, there are skills that only the regional city administrators assessed as paramount. The ability to present the results of the work done (47.8%) is among these skills. Federal and municipal civil servants assessed this skill as of secondary importance (for 49.4% and 44.9%, respectively). Perhaps this is also due to the fact that among respondents from the group of regional city administrators, the majority takes the position of assistants (advisors) (33.3%). It is known that one of the functions of an assistant is to present the results of the work done.

An interesting observation is that municipal officials assessed the ability to solve worldview, social and personal problems as the primary skill (37.5%). Federal and regional officials assessed this skill as of secondary importance. Certainly, this may be due to the fact that the local authorities are closer to the public, and contacts with citizens concerning local issues occur regularly.

There is a stark difference in the priority of the ability to invent new tools of professional activity. Only city administrators of regional authorities believe (29.1%) that this skill is not important in their professional activities, though it would be rather good to possess this ability. At the same time, federal and municipal officials assess this skill much more higher and suppose that it is important in the professional activity, though is not paramount. Further research should be done concerning the application of new tools in the professional activity of city administrators.

Thus, it is obvious that there are different skill requirements for federal, regional, and local levels of government. Therefore, the competency profile varies among the city administrators of the federal, regional, and municipal authorities. Only a small group of skills is equally important for each level of government.

Among the most unclaimed skills for city administrators are those related to research activity or connected with knowledge of the international aspects of public administration (Table 2). In our opinion, this choice of unclaimed skills could be explained by the general trend in the international isolation of public management which takes place in Russia: such topics as state secrets and information leakage traditionally have received increased attention. In the last few years, it has clearly increased.

**Skill Requirements for City Administrators, Russia, Table 2** The least required skills of city administrators

| Skill | Percent of respondents that assessed the skill as an essential in the public service |
|---|---|
| 1. To be aware of the international competition | 30.4 |
| 2. The ability to apply the methods of analysis of public economics | 29.7 |
| 3. The ability to apply the methods of social sciences in the process of expert and analytical work | 26 |
| 4. The ability to apply the methods of scientific research activities at international level | 25.9 |

The study also explores connections between some skills of city administrators and their category of position on the career ladder and the level of power of government authority. The correlation allowed us to identify common trends based on the associations of skills with the structural, official, and social factors. For instance, the higher the job category of public official, the higher the significance of the ability to make decisions and take responsibility for them. The higher is the job category of public official and the higher is the level of power, the higher is the significance of the sense of public duty and social responsibility. The lower the level of the public authority, the higher the importance of the ability to engage constructively with citizens, public institutions, and communities.

## Conclusions

The activity characteristics of government and municipal employees depend on their position and their place in the power vertical. This fact, which is evident, on the one hand, but empirically

proven, on the other hand, should be taken into consideration when professional standards for officials of different levels are developed. In the Russian three-level system of executive authority, competency profiles can (and must) differ in details, though the "services" imply common essence by definition.

When taking management decisions associated with standardization of officials' activities, it is necessary not only to develop the standards "from the top-down" but also to analyze the meanings and preferences that the government and municipal employees themselves enclose into their routine professional practices. Giving an order does not mean immediate obedience even in case of such a normative-oriented социальнойгруппsocial group as the government and municipal employees. The data obtained during the study are indicative in this regard, which concern the importance that the respondents place on the use of contemporary information and communicative technologies, and of technical aids, in their professional activities. Only 53.1% of the respondents consider it significant, despite the fact that informatization of the state government bodies, creation of the Open Government, and work with open data have been declared by the president and the government of the country for over 10 years already. Consequently, filling of the "state order" for formation of new habits and skills must be accompanied, at the very least, with an analysis of the government and municipal employees' ideas of what their work should look like.

The competencies that are formed at higher educational institutions, but never used in the course of practical activity (scientific research and pedagogical competencies, international relations), also remain debatable. On the one hand, an approach is possible that would be focused on the knowledge and skills really necessary for the officials, excluding those competencies, which are not necessary, in their opinion, and only take up time. But if we consider competencies as the core of the official's professionalism, then development of knowledge and skills associated with formation of a broader outlook on the world is necessary. Such development is a presupposition of transformation from the rather narrow definition of government employees' professionalism as a range of actions the officials can perform, to the constructive understanding of the ethos of government service as the cause. Formation of the officials' competencies, this way, has a dual nature and reflects the conflicts between the adopted standards of professional activity and the need for enhancement of the official's professionalism in the light of global trends.

# Small Enterprises and Development

Christopher L. Atkinson
Walden University, Minneapolis, MN, USA
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA

S

## Synonyms

Entrepreneurship; Small business development

## Definition

Entrepreneurialism: a belief in supporting the creation of new businesses or ventures.

Small business/enterprise: a firm meeting the size standard, whether number of employees, maximum gross receipts, or other calculations, for a public program supporting such enterprises.

Technical assistance: providing counseling and training to a business given its specific needs to build its capacity and encourage growth.

## Introduction

Small enterprises contribute greatly to society: they can allow for stability and growth in economies, creation and maintenance of jobs, and economic resilience in the time of crisis. It is thought that entrepreneurial activity is an important aspect of economic growth; small businesses are crucial throughout the world and are of importance in developing regions (Hyder and Lussier 2016). Small enterprises are integrally connected to the economic sustainability of communities. Their success is elemental for political, economic, and social aims, and for those reasons policymakers regularly create programs that favor small businesses, by intervening in the market to spur creation of new small enterprises and crafting a sort of *business safety net* to avoid small business closures. Small enterprise policies form a cornerstone of platforms in the political sphere, and the positive rhetoric of supporting small business has widespread backing.

Government support of small businesses is a legitimate government purpose, given the connection between employment, community investment, and the retention and expansion of small enterprises. Public policy in support of small businesses, whether for entrepreneurship, innovation, or contracting opportunities in public procurement opportunities, is rationally related to this larger public interest; while such programs may provide private benefits to business owners, there are considerable secondary benefits, including great potential for economic development in terms of the multiplier effect of public spending, depending on the level of government. Governments that seek to spend money on encouraging entrepreneurship and innovation, or to create opportunities through policy for small businesses to compete for and win public contracts, often mean to utilize the potential of small businesses to enhance employment opportunities and grow investment. Positive gains in both respects equate to potential increases in tax rolls, along with the possibility of additional public investment in business programs or social programs of considerable normative importance to policymakers.

## Small Enterprises

There is disagreement in the literature and in enacted policy on how to best define a small business. Small businesses are defined by the US federal government, under Title 13 CFR 121, by their industrial classifications for size standard purposes. For its part, the US Small Business Administration defines a small business according to "economic characteristics comprising the structure of an industry, including degree of competition, average firm size, start-up costs and entry barriers, and distribution of firms by size. It also considers technological changes, competition from other industries, growth trends, historical activity within an industry, unique factors occurring in the industry which may distinguish small firms from other firms, and the objectives of its programs and the impact on those programs of different size standard levels" (13 CFR §121.102(a)). Small businesses are not supposed to be dominant in their operational fields (13 CFR §121.102(b)) (U.S. 2016).

Noting the above, some size standards can be surprising in their inclusion as to what constitutes a "small enterprise." As an example, a heavy construction company might earn just below $36.5 million in average annual receipts and still be considered "small." Manufacturing concerns can range up to 1500 employees. It is important to consider that a small enterprise might compete against other small enterprises in a government program, but the wide range of businesses within the classification of *small* could make competing very difficult for littler firms or firms with lower capacity and staffing. Other governments and levels of government may have their own definition of small where it concerns size of businesses,

so definitions can vary widely and be associated with local or regional concerns. Even with extensive methodologies for what constitutes a small business, the rationale for choosing one size over another can be thin and a matter as much for political viewpoints as for a method situated in knowledge of economics and what is optimal for development purposes.

Small enterprises have a significant impact for economies. Using the US example, for the 5.73 million "employer firms" that existed in 2012, "firms with fewer than 500 workers accounted for 99.7% of those businesses, and businesses with less than 20 workers made up 89.6%. Add in the number of nonemployer businesses – there were 23.0 million in 2013 – then the share of U.S. businesses with less than 20 workers increases to 97.9%"; businesses with less than 500 employees employed 48.4% of private sector staff and produced 46% of nonfarm GDP in the private sector in 2008 (Small Business and Entrepreneurship Council 2016). A strong positive relationship has been found between small (and medium-sized) enterprise activity and the growth of GDP per capita, but it is not clear whether a strong small enterprise sector causes growth or is evidence of a strong economy; further, SME firms might not also have such a strong impact on poverty mitigation or addressing imbalance of incomes (Beck et al. 2005).

Small business growth and development has its own segment of the academic literature. As an example, it is known from such work that businesses tend to take on more of the trappings of formalized business arrangements when they exceed "micro" size (employ at least ten employees): they also employ more outside the family unit, have succession plans to keep the business going, and show improved financial management capacity (Lussier and Sonfield 2015).

## Public Policy Propositions for Small Enterprise Programs

Small business programs become considerations for the government because of the primary economic development intents of decreasing unemployment and increasing investment in communities. Policymakers may seek to create a business-friendly culture in their community or region – a culture that understands and values entrepreneurship, eliminates barriers to business growth and development, and offers significant benefits to enterprises, in terms of a ready, educated workforce, and excellent quality of life. In effect, governments need the private sector to support communities through jobs and investment. Policy is developed to support these expansive interests and may take the form of training programs to encourage entrepreneurship, mentoring programs and technical assistance involving a partnership of sorts with the business community, and contracting programs to accord solicitation opportunities to small enterprises, so that they receive a share of taxpayer proceeds that will in turn be used by businesses to spur even more economic development. It is hoped that the policy solutions are in keeping with the needs of business; however, in order to work effectively, written policy must align with culture and business considerations. Differences in business-oriented culture and dependence on legacy industry may account for some of the reason some regions lag behind in entrepreneurial development (Huggins et al. 2015).

Government interventions in support of small enterprises abound. They can include creation of agencies intended to support small enterprise development, offer technical assistance in business-related matters or matters pertaining to success in public contracting, and act in the capacity of ombudsperson or advocate for small enterprises. Financial incentives and loan programs might be directed to small enterprises. Import-export assistance and training programs can be offered; business incubators or access to resources like broadband connectivity have also been used to help small enterprises (Blackburn and Schaper 2012). Many governments also offer bid preference credits and establish goals to assure inclusion of small enterprises in public procurement solicitations.

The legitimate government purpose in supporting small enterprises has often resulted in

passage of programs designed to assist and encourage small enterprises and to remove barriers for their involvement in the opportunities of the public sphere. Given that the vast majority of enterprises might be considered "small," they collectively make up a considerable portion of total employment, as noted above. A problem might be the ability for small enterprises to influence the policy process, often without the services of lawyers and lobbyists that may push beneficial agendas for larger concerns, so that policies reflect real business needs, and government involvement will have a marked public benefit.

There have been criticisms of government focus on small enterprises. Large firms make use of economies of scale in production; larger firms might also be more stable over time and are thus arguably as worthy or more worthy of policy attention given their impact on the economy. Supposed solutions to assist small enterprises might be harmful to market function and the larger economy and actually prevent firms from growing and operating efficiently. Further, it has been contended that it is not small enterprises alone that require assistance, as all businesses potentially benefit from governments paying greater attention to contract enforcement and reduction of barriers to business (Beck et al. 2005). Programs supporting small enterprises can be costly to run; they might also cause dependency on the government intervention and might dislocate existing firms (Bennett 2014).

A primary concern in supporting any policy intervention in encouragement of small enterprises is program evaluation and the specter of noncompliance. Depending on how small enterprise programs are configured, it may be difficult to tell how much of the program result in favor of small enterprises was the result of the program itself and how much of the supposed benefit was due to market forces. Program implementation staff must guard against a variety of gambits, including false fronts and sham operations, intended to gain certification benefits without meeting eligibility requirements. Some small certified businesses may take a small portion of the value of a public contract and in turn let that contract to an ineligible business, or if involved in a large contract, back to the prime contractor. Benefits to individual small enterprises, and in turn to society in employment and investment, can only occur if small enterprises receive program benefits as accorded them in law. Programs for small businesses may end up supporting medium- or even large-sized businesses, in potential conflict with the original program intent (Smallbone et al. 2008); this possibility is more distinct where standards for small business definitions are, for lack of a better term, relatively large, where in the minds of voters such activity could be seen as a sort of corporate welfare program. Constant effort to evaluate program outcomes and adjust program offerings to assure that intended outcomes are served is a good advice for communities considering policy in support of small enterprises. The benefit to the public generally must remain paramount for such programs to serve their intended purpose, add to the legitimacy of the public enterprise, and provide a considerable benefit to business partners.

Where the government wishes to support the increase of innovation, to spark customer demand or address extant failures of the market to provide needed products and services, public policy might do well to not focus on the possibility of radical change. Incremental innovation can provide great benefit in terms of increasing employment and investment; focusing on large expenditures in support of research and development, or incentivizing such activity, might be relatively less beneficial than obtaining marginal benefits from small enterprises that propose to innovate at the margins, where small increases in efficiency are no less welcome (Forsman 2011).

## Entrepreneurship

Entrepreneurs have historically been important for their ability to take inventions and bring them to purposeful use in the marketplace. Entrepreneurs benefit society by being on the lookout for "opportunities to introduce new products or processes, new uses for extant products, new methods for putting them to use, [and] new

markets that will be receptive to them" (Baumol 2008, p. 576). As an example, it is sometimes assumed that small enterprises that are engaged in high-tech work and possess a level of innovation will result in employment growth (Smallbone et al. 2008); technology items and new ways to use technology are proven areas for entrepreneurs because there is a ready market for these products. Governments may intervene on the part of what are called targeted industries, where the greatest need for more businesses exists and where the greatest potential for growth lies; special benefits may be accorded to firms in targeted industries. Entrepreneurs looking for growth opportunities might focus on these targeted areas, because they purportedly offer the greatest potential for return on investment and employment returns. The hope in many respects is that an entrepreneur will think of the next big consumer must-have, fulfilling some heretofore unknown need in the consumer mind, or develop a product or service that changes the nature of how an industry behaves. In the process of such activity, entrepreneurs may create a widespread impact to the new business and associated businesses.

A new smartphone might, for example, create a highly competitive and lucrative market for applications to function on the phone. The phone might include a variety of new technologies, and these technologies could be supported by other partner businesses. This cluster approach to economic development tends toward very forward-thinking entrepreneurs at the center of such enterprises, though it is exceedingly difficult in practice to determine what consumers are lacking, or what they might want most, next.

While entrepreneurial activity is thought to be inextricably linked to economic growth, not all entrepreneurial activity is positive, especially when it is limited to rent-seeking and fails to serve policy interests. In addition, it has been suggested that business performance is tied to age and size of small enterprises, with younger, larger businesses tending to perform better, more than the entrepreneurial proclivities of owners; having a business plan also has an impact on business performance (Blackburn et al. 2013).

## Innovation

Innovation, "the generation and implementation of new or improved processes, services, products, production methods or single actions aimed at increasing the competitiveness of an enterprise" (Forsman 2011, p. 739), is thought to be closely associated with small enterprises and is a common rationale for government intervention in support of small enterprises. As small firms enter the marketplace, the thinking is that there is a chance that they are more likely to respond to market needs than larger firms and possess a certain innovative insight, unbounded by larger corporate structures. Small firms are thought to be more efficient in responding to new market needs, possibly capable of bringing innovations to market more quickly. The capacity to innovate is affected by a variety of factors. The literature has seized on the idea of innovation capacity and the need for networks, given that association with other firms might reduce research costs and improve knowledge sharing (Forsman 2011). Innovations can be made to both products and service delivery and can be incremental or far-reaching; the level of innovation associated with specific industry is impacted by technology use and entrepreneurial tendencies that are common for the type of work of the business. Some areas, such as information technology, might more commonly exhibit relatively radical innovation. Others might typically experience incremental innovations, improving upon well-worn business models that are generally accepted by a strong customer base. For example, manufacturing sectors might exhibit less radical innovations than service industries, but the nature of innovative difference is not so much between large industry groupings as it is between subsectors of these industries (Forsman 2011). A small business entering any market must be aware of the context of the product/service as well as customer expectations; where there is great unresolved market needs, opportunity for innovation and expansion of product/service offering exists more plentifully.

Noting the above, most small businesses do not innovate radically or at all; instead, they merely provide a product or service where the market

requires it. Some make incremental changes to existing products and services, but the idea of the radically innovative small business, while romanticized in the media, is in reality associated with a type of enterprise that is exceedingly rare – where unrealized market need is understood and exploited by forward-thinking, creative business leaders. There are few unrealized market needs without large-scale societal shifting and few entrepreneurs that have such a keen insight into the human psyche.

## Conclusion

Even with the criticism of small enterprise public policy initiatives, such programs can provide significant benefit to small enterprise owners. Given the importance of small enterprises to both employment and investment activity and the value small enterprises have as a normative matter in the popular mind-set, the government interest in support and development of these businesses will likely remain.

# Soap Recycling, Trash into Treasure

Samir Lakhani
Eco-Soap Bank, Pittsburgh, PA, USA

Social entrepreneurs

## Introduction

Entrepreneurship can be many things. But for me, it's about taking that *first* step – and not exactly knowing where your foot might land.

My first step would lead me to start Eco-Soap Bank, a global nonprofit organization. It has a simple, but very powerful, mission: to employ women across the developing world to recycle leftover soap and redistribute it to children and families in need.

While the idea of "soap recycling" is far from novel (with two organizations preceding Eco-Soap Bank), our approach was quite new in our ability to empower disadvantaged women worldwide to lead a grassroots movement to change the way hygiene is practiced and perceived by millions of people.

Our organization is grounded by the conviction that no person should ever suffer from a preventable, hygiene-related illness while hotels and factories discard millions of usable bars of soap *every day*. It's estimated the global hotel and soap manufacturer industries will waste millions of bars of soap and hygiene products every single day (Hanes 2017).

Since inception, Eco-Soap Bank has employed 154 women across 5 countries to recycle this perfectly viable waste stream. We have remained committed to hiring women who are experiencing some barrier – from disability to single motherhood and to economic disadvantage – to steady, safe, and predictable employment.

To date, these women, our "Hygiene Ambassadors," have provided soap to over four million people (and counting) along with culturally relevant hygiene education. We have reached people in 22 countries, including some of the most remote and dangerous regions on Earth with basic hygiene, a fundamental human right.

We have been able to redistribute recycled soap in some of the most remote regions on Earth from Himalayan mountain communities to floating villages along Cambodia's Mekong River. EcoSoap has been used in creative new ways, such as a widespread distribution to over 80,000 Kenyan students to teach proper hygiene and to reduce the prevalence of trachoma, a preventable, hygiene-related blindness which has caused eight million preventable blindness cases globally (World Health Organization 2020).

Eco-Soap Bank makes several types of impact simultaneously: environmental action, women's empowerment, and health and hygiene. This multifaceted model did not come out of thin air or materialize fully formed during an ideation session. As with most entrepreneurial endeavors, the model materialized step by step. We built on our strengths, tried new approaches, and invested time, money, and energy in some things that worked really well and others that, well, didn't.

But, every story has a beginning. Eco-Soap Bank was born in a single moment of inspiration – in a guesthouse bathroom in remote Siem Reap, Cambodia.

## Founding Story

It was not until recently that I began to believe in a version of destiny. What I mean by this is that we usually can tell where we are going, based on where we came from and where we have been.

For me, everything that I am I have inherited from my parents. My mother and father were born in East Africa, Tanzania and Uganda, respectively. They would tell me about conditions "back home" and how they moved to America to become independent so they could give back to the places they left. So, from a very early age, I felt a sense of responsibility to the less fortunate.

Secondly and crucially, travel was in our blood as a family. My childhood, adolescence, and young adulthood were shaped by multiple international trips, notably several short-term stays of a few months each in Tanzania, India, and Southeast Asia.

But, it wouldn't be until my college internship in Cambodia that a single moment would change my life forever.

In 2014, I was studying Environmental Science at the University of Pittsburgh and had a strong passion for sustainability. The Climate Movement was really gaining speed and momentum, and this was around the time the Paris Climate Agreement was being drafted and signed by world powers.

In order to complete the internship requirement for my degree, I chose to craft my own project studying the effects of climate change on rural agrarian communities in Cambodia. I wanted to understand a locally pioneered agri−/aquacultural technique called a "Community Fish Refuge." It was an elegant solution to Cambodia's increasingly drought-stricken agricultural lands via an aquaculture technique which let fish spawn and mature where food (mainly rice) was growing. In

the simplest terms, this locally developed solution grew rice and fish at the same time, countering the effects of climate change and building resiliency for the world's poorest.

I spent weeks in Cambodian villages interviewing families and looking at ponds, which, during the dry season, were sometimes no more glorious than a dirt hole in the ground. I was fascinated. I adored the fact that this project was locally developed, strategized, and executed. The community, not outside investors or foundations, owned it. This, I felt, would be the type of solution which would solve humanity's deepest issues.

Then I saw something I will never forget. One day, while spending time in a rural community, I witnessed a village woman bathing her newborn child – using laundry detergent.

I had seen poor hygiene conditions all around me during my weeks in these communities, but for some reason did not react until that moment. Something about that mother and her child and the caustic nature of the detergent made me realize that hygiene was far too out of reach for many families.

According to the Centers for Disease Control and Prevention (CDC n.d.), over 2100 children die each day from diarrhea, making it the second leading cause of death in children under the age of 5. Handwashing is one of the most effective ways to prevent diseases like diarrhea – which kill more than AIDS, malaria, and measles combined. But according to the World Health Organization (WHO), in some parts of the developing world, only 1% of households have access to soap (UNICEF 2015).

I knew laundry powder could not possibly be the correct product to reduce germs and prevent severe illness. But it turns out laundry powder in Cambodia had become a widely adopted alternative to bar soap (or other appropriate soap) because of a single truth: bar soap is too expensive for most families already struggling to feed their families.

After some additional interviews and research, I began to learn about the very different and often widely held beliefs about health in Cambodia. For example, a few mothers said and agreed that if their children fell sick from a preventable disease, it was because of sins their child may have committed in a past life. When it came to hygiene access, it became clear to me that cost was not the only barrier, but culture and education had roles to play as well.

When I returned to my guesthouse room on the night of my encounter with the village mother and her newborn, I felt completely resigned. I could not get the image out of my head.

When I inevitably stepped into the bathroom, I noticed my housekeeper had thrown away my half-used bar of soap and replaced it with a new one. I thought, *what a waste*! The mother I had seen before could have used it. And then it hit me – she really *could* use it; all that needed to be done was to connect some dots.

These are the moments that every entrepreneur lives for, when an idea seizes you. It can be exhilarating, but not always particularly pleasant – ideas can grow deep roots, keep you up at night, and distract you from almost everything else.

I remember staying up that night thinking, indecisively, if I was going to *actually do this* and commit. I felt a hesitation which was deeply uncomfortable. Limbo was unsettling because I knew the idea was too good, too irresistible to let go – and it had the ability to consume my life.

But, by morning, this indecisiveness had vanished. I got to work on starting a soap-recycling initiative, which would, in a few years, grow to global proportions.

## First Partnership

Angkor Wat, the most widely recognized temple in Cambodia, housed in the largest temple complex in the world, lies a mere 5 miles from downtown Siem Reap (Cambodia Tourism 2018). Siem Reap, itself a town of only about 140,000, hosts approximately two million tourists per year to see the wonders of the ancient Angkor civilization (National Geographic 2018). That meant there would be a literal mountain of soap being thrown away daily in that small town in Northern Cambodia.

Entrepreneurs will not always have the luxury of strategizing and planning. In fact, this alternative method can often slow down one's momentum and has the tendency to stop good ideas in their tracks in the face of seemingly insurmountable challenges.

In many ways, founders and entrepreneurs find a way to focus on only the immediate next step, without getting too far ahead of themselves. My next step was materializing a first partnership with a hotel – and to convince them to give me their dirty soap.

With just days left before I would board a plane back to the USA, I mocked up a quick flyer explaining my soap-recycling concept, borrowed an old bicycle from my guesthouse, and set out to visit the larger hotels in the city.

Picture this: a young man parks his bicycle in 110+ degree weather and is completely drenched in sweat wearing a camping shirt. He walks into a five-star hotel, approaches reception, and asks to speak to the general manager about saving, sanitizing, and supplying the hotel's leftover soap all over Cambodia such that we can prevent disease and save lives. (You wouldn't be the only one to think that's a crazy idea.)

It was rare that I got to speak directly to general managers. But when I did, they quickly saw the value in soap recycling and the lifesaving potential of a partnership. It was a win-win for the hotel, being able to responsibly recycle their waste and make a community impact. In a few days, a half-dozen hotels were enrolled in the project, with housekeeping starting to save all those slivers of what would have been trash.

The pilot began – but my trip was coming to an end.

I had committed to following through on my soap-recycling idea and had even convinced a handful of hotels to make a go of it. But I was leaving and, with a semester ahead at school, had no idea when I would be back. I needed to secure a way for the project to persist without me. Trailblazer Cambodia Organization (TCO), the nonprofit behind the fish refuges, had agreed to house my soap-recycling project, but I would still need to hire someone to keep the project's momentum up on a day-to-day basis.

That's when I met Thearang, Eco-Soap Bank's very first employee and soapmaker.

After speaking with a few women's groups who helped young, rural women find employment in Siem Reap, we sat down for an interview with Thearang. She was a young woman who had left school prematurely. During the interview, I recall how shy Thearang was, saying not much at all in response to our questions. Yet it was clear she was in search of employment, perhaps had some pressure at home, and would work hard.

Over the coming years, I would learn so much from Thearang, who still works for Eco-Soap Bank and has become a close friend. From starting as a solitary soapmaker, she now manages 35 other soapmakers as our operations manager in Siem Reap. She has proved indispensable – conducting Eco-Soap Bank business in both English and Cambodia's native Khmer – and has displayed a certain local savvy that has gotten us out of more than one jam.

Thearang is particularly fond of working with children and equipping them with the soap and hygiene that they need. While Eco-Soap Bank may have given her the platform, the belief, and some investment, she is the one responsible for her own transformation with a passion for this work that outstrips mine.

Thearang (and the dozens of other soapmakers and personnel like her) was and is indispensable. With staff on board, I had to turn my attention to the next challenge to Eco-Soap Bank's sustainability – funding. Motivated by fundraising to keep women like Thearang employed gainfully, I got to work.

## First Funding

The old fundraising platitude is entirely correct: *People Give To People*.

I think of early-stage fundraising as a series of concentric circles, first starting with friends and family; then expanding to those in your network of friends and family; and then, lastly, reaching strangers through media, press, publicity, and other networking opportunities.

I was very fortunate that friends and family had the means to support my passion project in those early days. They gave generously, but they gave to *me* and not necessarily the project.

In pursuit of a wider funder base, I tapped my networks for every coffee, dinner, or presentation opportunity I could. I gave hundreds of talks at local Rotary, Lion, and other clubs. I met groups of women for tea to talk about my idea to recycle soap and save lives. While many commented on the novelty of the idea or sometimes even the structure of our model, most seemed compelled to give simply because they had met me and were taken by my passion for the work. Again, it seemed, *people were giving to people.*

When Eco-Soap Bank broke into the last concentric circle, however, the funding paradigm changed. Funding at a public scale is based almost entirely on reputation, strategy, and measurability. While still being very important, charisma and storytelling accounted for less at this level. Whether it was a family foundation or stranger who stumbled across our work online, people wanted to give with confidence of exactly what their dollars would achieve.

No matter which concentric circle one is in, ultimately, fundraising always comes back to respect. If a potential funder does not feel their time, energy, or investment will be treated with respect both professionally and personally, they will search for other recipients who demonstrate these qualities.

## Walking Alone

One of the very first things I learned about entrepreneurship is that it is a lonely pursuit. I do not mean that the work isn't done without mentors, staff, volunteers, advisors, and peers. During business building, one is constantly surrounded by people, interacting with dozens per week.

Nay – it is another type of loneliness, which is only the founder who will carry the through-line of this work through iterations of staff and teams. Founders and CEOs have to serve as both the historians and visionaries. Mentors and advisors can play their role, and then move on to the next project, as they should. There is always a time and place for mentors and advisors, and the institution of mentorship is not meant to necessarily be permanent.

The burden is far more complex and deeply seated than worrying about payroll, financing, ethics, etc. It is simply knowing the simple fact that *no one else* will see the ship through to the other side. No one will ever be able to match the founder's intensity, passion, and unique set of experiences, which drives her through thick and thin – to the other side.

You are utterly alone. By yourself. Impregnated with an idea, which will consume you. And we probably wouldn't have it any other way.

## Chasing Sustainability

After a few years of working very hard to support Eco-Soap Bank, it began to dawn on me that there was a limit to personal fundraising appeals. Our organization needed to become more financially sustainable in the long term and one day even provide enough economic value to support itself.

We entertained and worked to develop several business models over the course of Eco-Soap Bank's development. One of our earliest ideas was to charge hotels a small premium to participate in the soap-recycling activity and benefit in positive, impact-focused marketing campaigns to boost their brand and publicity. This business model was working for us, until we were forced from it during the COVID-19 pandemic when such corporate social responsibility (CSR) programs were quickly unfunded.

Our second business model was to sell a premium soap product in Western markets, such as the USA. We began to offer a 100% recycled product made by women abroad via ecommerce. While early campaigns and pre-orders demonstrated great interest in the product and value proposition, we could not scale the program up without significant investment which we were not able to secure as a nonprofit organization.

By trial, exploration, and internalizing a philosophy of *failing fast*, we have found a business model in perfect alignment with our mission to redirect as much soap as possible to vulnerable

people in need. During the COVID-19 pandemic, international nongovernmental organizations began procuring large amounts of bar soap to keep people safe. We began striking partnerships with these organizations to provide them with environmentally sustainable soap at an affordable price.

By buying our recycled soap, these international NGOs could support local women directly in the countries they served, not a multinational for profit company or shareholders. And, since we were receiving raw materials from manufacturers, we could recycle soap at a fraction of the usual cost and pass those savings onto our partners and ultimately the families who needed it.

In the startup mindset that products need to either be *better, cheaper, or faster*, we created a model that satisfied all three.

Better: While this method of measurement has always been the most subjective and vague, from an environmental and utilitarian standpoint, we focused our efforts to create sustainable and long-lasting soap. Our unique recycling process allows us to create dense bars of soap which can last users longer and optimize the product.

Cheaper: Since the raw material is effectively given to Eco-Soap Bank, we don't bear raw material sourcing costs, taking that cost piece away from our users. Furthermore, since the vast majority of recycling occurs in the country where the soap is sold or distributed, we are able to reduce shipping costs for buyers, enabling them to procure more product or save funding for other life-saving expenditures.

Faster: Core to our name at Eco-Soap Bank is the concept of the banking products for times of emergency or crisis. We have always kept supplies on hand for rapid distribution when disaster strikes, and a quick response is needed. We helped combat the Ebola crisis with supplies in Sierra Leone and Liberia in 2016 and have responded to hurricanes in Honduras and other countries.

## Short-Term, Long-Term Impacts

Eco-Soap Bank strives for three areas of impact: environment, public health, and women's empowerment.

By recycling soap, we are able to significantly reduce waste and offset carbon. While, in the short term, it is harder to understand the tangible effects, it was important that our humanitarian solution was not being done at the expense and sacrifice of the environment. The environment has suffered for far too long in the pursuit of human progress.

The economic effects of poor hygiene are severe but diffuse. For example, systemic health problems can have drastic consequences on rates of school absenteeism. The poorest populations in developing countries have net primary school attendance rates as low as 4% (UNICEF 2019). Many women in developing nations also face myriad challenges. Steady employment for women is one of the most serious economic issues in developing countries today [GlobalWA 2017). To mitigate this, all Eco-Soap Bank soapmakers would be women from disadvantaged backgrounds with no other reliable source of income. By employing them at a good wage and helping them to support their families, Eco-Soap Bank would also have a critical social impact.

This economic impact makes short-term impacts (alleviating poverty, returning children of our soapmakers to schools) but also important long-term impacts of education, health, improved nutrition, and other benefits that come alongside improvements in standards of living. Furthermore, many of our staff have moved into cities which will give their children a better chance for higher-quality education and more employment opportunities.

Lastly, the public health impacts remain both short and long term. As a short-term impact, improved health and sanitation can reduce morbidity and mortality. In the long term, improvements in hygiene habits can reduce chronic illness, reduce medical costs, and, most importantly, create generational change (with the passing of good hygiene habits from one generation to the next.)

At Eco-Soap Bank, we have been as meticulous as possible to make short-term and longitudinal impacts, which may not be immediately measurable, but align with the primary ethos that we are trying to empower people to take their

lives, finances, and health back into their own hands once again.

## Sidestepping: 2020 Pivot

Most people will remember the year 2020 for many different reasons. Globally, the COVID-19 pandemic came with enormous economic consequences and took the lives of millions. For the business and entrepreneurial community trying to stay afloat, 2020 was dubbed "The Year of the Pivot." For Eco-Soap Bank, it was no different.

Before 2020, our entire supply of leftover soap came from hotels. But when the COVID-19 pandemic hit, the international tourism industry ground to a halt.

Almost overnight our supply of used hotel soap had disappeared – at a time when hygiene was more important than ever. It was an unmistakable irony.

With our usual supply chain on pause, we were forced out of our comfort zone and had to get creative. We began to reach out directly to soap manufacturers to explore the possibility of receiving soap donations. What we discovered would forever change Eco-Soap Bank and our work to save lives with soap.

Upon speaking with dozens of factories and large consumer good companies, we learned that as a normal part of their manufacturing processes, millions of bars worth of waste in the form of powder, damaged bars, pieces, and slivers were being discarded. There is always some waste created during manufacturing processes, and a few factories were generating hundreds of tons of soap waste per year.

Furthermore, it was not just scraps and pieces of bar soap we were discovering, but thousands of gallons of liquid soap, hand sanitizer, body lotions, and other essential hygiene goods. We had discovered a silent waste stream of usable product that was pre-consumer, entirely separate from the post-consumer product we had focused so heavily on with hotels.

There seemed to be massive volumes of waste being generated by manufacturers globally of all sorts of products with little to no accountability or widespread solutions. All at a time when the COVID-19 pandemic was making access to hygiene products more crucial than ever.

Eco-Soap Bank's 2020 pivot was not just about finding another supply of used soap for our operations, but it was about becoming a global recycler and humanitarian distributor.

It proved to be a win-win partnership situation – soap manufacturers and consumer goods companies gained a reliable, turnkey solution to their waste stream problem, and we secured access to a new supply stream of raw hygiene products that enabled us to continue our soap-recycling work and reach millions more people in need.

## Think Globally, Act Glocally

For many years now, I have heard the colloquial phrase *Think Globally, Act Locally.* I thought about that widely used phrase in the context of my own work and mission. *Did it fit my work and model?*

I have always been a proponent of working globally, since comparably, the developing world has incredible and deep needs. Things we take for granted here in the West, or can be easily purchased, received, or donated; are considered luxury items in many of the countries we work in, like simple soap.

It is the latter aspect of the phrase with which I partly disagree. While empowering local leaders is key to making sustainable change (and is a core philosophy of Eco-Soap Bank to employ local leaders to run the various, global operations), the saying recommends thinking local to your community. However, the disparities in resources mean that communities acting locally for their own betterment and community self-interest may not result in equitable, global change, but concentrate resources in certain areas of the world only.

We, as global citizens, ought to feel responsible for our brothers and sisters whom we have never met across the globe. It is buried deep in my bones that there is no difference between me and anyone else, and therefore, we all need to rise as one – not necessarily segregated by country, community, or other affiliation.

Some people raise objectives to the methodology by which US schools are funded by property taxes, citing that more affluent communities have more funding for their local schools and therefore create a disparity in comparison to less affluent neighborhoods. This is how I think about global action, and if we only work to better our own communities, a disparity will grow. An inequality gap will grow.

In practical terms, this means that we should prioritize the least fortunate first – no matter where they live. We live at a time where nearly 80 million people were forcibly displaced at the end of 2019, according to the UNHCR (2021). Secondly, I believe that if we want to make an impact away from home, we must empower the leaders who are most qualified to do so to serve their local communities.

## Accolades and Humility

Little did I know that giving a brief talk online to a fifth grade classroom would forever change the course of my life and for Eco-Soap Bank. Public speaking always came naturally to me, and I took every opportunity to spread the word about Eco-Soap Bank and my story, in the hope that I could impart one critical message: the planet needs advocates, and we can no longer take it for granted.

Explaining to young people the sheer volume and magnitude of soap waste generated per day usually elicits profound reactions. Informing students in America about the fact that most children in the developing world don't have any soap in schools or home cultivates a different sort of reaction, one more thoughtful: the early formation of *empathy*.

I must have given hundreds of talks just like this one for an elementary school in Connecticut. After the talk had wrapped up and many months had passed, I received a phone call from a producer at CNN.

She asked me if I knew the program *CNN Heroes,* an Oscars-like award program where everyday people are recognized for their service to humanity or impact. It was the closest thing to the Nobel Prize for nonprofit leaders (CNN 2017).

She did not know that I had been watching that show religiously for the last 10 years. She did not know that the show has left a deep and lasting mark on my being. I remember specifically being drawn to the heroes being recognized on that show who were able to reach millions of people through their creative or life-changing ideas. The notion that a single person could touch millions was attractive to me on a fundamental level.

I told her about my affinity for the program and how inspirational it was to me these many years. That's when she very kindly let me know that a fifth grade teacher had nominated me for a CNN Hero Award that year – and that I would be recognized on an internationally broadcast TV program later that winter.

I thought it was a total gaff – the full circle nature of this was too good to be true. I fell completely silent, choosing my next statement very carefully asking her if this was real. She explained more about her job working with other heroes, and she was there to help tell my story – and so I told her. Everything.

Virtually overnight, Eco-Soap Bank became an international sensation. In a single night, the evening of the program, we received thousands of emails and donations from people all over the world. However, I just couldn't understand why I was chosen. *Why me?*

## Conclusion

Our impact was just starting, and while we had redirected soap to over 650,000 people at that time across several countries, the impact felt negligible considering there are 2 billion people globally that live without adequate sanitation every single day.

Then I realized it was the power of an *idea*. The whole experience would teach me the ability of an idea to change the world, and even more powerful was the ability to capture the mind and imagination of millions of people around the world.

My absolute favorite saying is the following, though: ideas are easy, but implementation is hard. These have been a few of the lessons I've learned during implementing this idea.

# Social Accounting

Laurie Mook and Rodney Machokoto
Arizona State University, Tempe, AZ, USA

## Synonyms

Social and environmental accounting; Sustainability reporting; Triple bottom line

## Definitions

Social accounting broadens the framework of conventional accounting with the goal of understanding the impact an organization has on its stakeholders. The effects of an organization included in social accounting typically include financial, social, and environmental dimensions. By taking a stakeholder approach, social accounting emphasizes the collective effort needed to run an organization and the multiple stakeholders impacted by its efforts.

## Introduction

Compared to traditional accounting, social accounting is a relatively new concept. It refers to the inclusion of a wider range of factors in the accounting model than just financial information. Social accounting typically captures the positive and negative impacts of an organization on the economy, society, and environment. Social accounting can be supplemental to the financial statements when it is presented in a separate report, or integrated with the financial accounts. Integrated reporting is generally preferred as it allows the social and environmental impacts to be placed in context with the financial performance of the organization. In contrast, supplemental social accounting reports have generally been criticized as marketing and public relations vehicles.

Integrated social accounting statements first appeared in the 1970s in the business sector as the public started demanding more information related to an organization's social impact (Mook 2007, 2013). This has been called the "first wave" of integrated social accounting and was characterized by bold experimentation and bold expectations for the times, such as the inclusion of environmental impact and measurement of minority recruitment and promotion. New accounting frameworks such as the social and financial income statement, the socioeconomic operating statement, the statement of fund flows for socially relevant activities, and the social impact statement were developed during this period. However,

these frameworks did not catch on and disappeared after a period of time.

The second wave of integrated social accounting was more cautious and appeared in the 1990s. This wave introduced the concepts of the triple bottom line, the balanced scorecard (BSC), and the Natural Step Framework. This is also the period when the conceptualization of social accounting models for nonprofits and cooperatives began, including the social impact statement, the cooperative social balance, and the expanded value added statement. The third wave of integrated social accounting, beginning in the 2000s, saw social accounting becoming more mainstream and connected to accountability and strategic planning. The Global Reporting Initiative (GRI) Sustainability Reporting Guidelines is one example that started in this time period.

## Theoretical Underpinnings

Accountants and non-accountants have historically treated the discipline of accounting as neutral, amoral, and value free. However, critical accounting scholars argue that accounting practices are not objective, neutral, or value free. Accounting practices create, sustain, and may even change the way one sees things. For instance, accounting for certain things while excluding others influences how social reality is constructed. As a result, society and societal players develop certain assumptions. The assumptions impact how society functions, and what values and expectations are promoted. Ultimately, this constructed social reality, assumptions, values, and expectations influence decision-making and policy-making processes. In other words, accounting is a driver of behavior. Traditional accounting drives behavior toward the maximization of profit. In contrast, social accounting drives behavior toward economic, social, and environmental goals (Mook 2007).

## Nonprofit Social Accounting in Practice

In practice, many nonprofit organizations collect information and report on their impact in their annual reports. Social accounting provides a framework to do this comprehensively and in a structured manner. There are multiple frameworks that an organization can use to guide this process, including the expanded value added statement, balanced scorecard, Global Reporting Initiative, and stakeholder impact statement. As mentioned previously, social accounting reports can be supplemental to the financial statements, or integrated with them. The preference is an integrated approach in order to connect social and environmental performances with financial performance.

### Expanded Value Added Statement

The expanded value added statement (EVAS) is an example of a social accounting statement that allows organizations to report both financial and nonfinancial measures of their performance (Mook 2007; Mook et al. 2007). Value added is an accounting concept that measures the economic value created (or diminished) by labor and capital in the conversion of externally purchased goods and services into new goods and services. Expanded value added considers also the social and environmental value added or destroyed.

A key contribution of the EVAS framework is that it allows a nonprofit to incorporate the value added by their volunteers, something which is usually ignored in conventional accounting. As volunteers provide substantial labor to many nonprofits, it is important to be able to make this visible in order to better reflect the performance story of the organization.

In order to include items in the EVAS, they have to be monetized. For volunteer labor, there are several methods available to do this. One is to look at each task that the volunteers perform and use an equivalent wage rate per hour for a similar paid occupation that involves those tasks. Another method is to apply a blanket rate to all volunteer labor. In the USA, the Independent Sector, a nonprofit which serves as an umbrella organization for the nonprofit sector, publishes such a rate annually. The rate is based on the average hourly earnings of production and nonsupervisory workers in nonfarm occupations plus an additional 12% for an approximation of fringe benefits (Independent Sector 2016).

### Balanced Scorecard

Another useful framework is the balanced scorecard model. This model brings together financial and nonfinancial metrics to provide a holistic view of an organization's performance. It is guided by the vision of the organization and is tied to strategic planning. Thus, it can be thought of as both a performance measurement and management tool.

In its original form, the balanced scorecard was developed for for-profit businesses and focused on four perspectives: financial, customer, internal management processes, and organization learning. It has since been modified for nonprofit organizations, social enterprises, cooperatives, and the public sector (Kaplan 2001). Two examples of how nonprofits have tailored their balanced scorecard around these perspectives are as follows:

1. Serve the client
   Run the business
   Manage resources
   Develop employees
2. Return: the multi-bottom line
   The stakeholder environment
   Internal activities
   A learning organization

A major benefit of the balanced scorecard approach has been in building trust with stakeholders and directing attention to performance beyond financial measures.

The balanced scorecard focuses attention on the interrelationships of these multiple perspectives and asks guiding questions in the following areas:

Financial: How do we look to our donors?
Clients: How do people using our services see us?
Internal management processes: Do our programs bring intended results?
Organizational learning: Can we continue to improve and add value for our clients and stakeholders?

An important part of the balanced scorecard process is creating a strategy map. This map shows the connection between the vision of the organization and the specific strategic goals in each perspective, including specific measurement criteria. An example would include goals of promoting an active and healthy community, safeguarding environment and natural resources, and meeting the needs of the nonprofit's clients.

### Global Reporting Initiative Sustainability Reporting Guidelines

The Global Reporting Initiative (GRI) Sustainability Reporting Guidelines is an example of a social accounting framework that was developed (and continually revised) by multiple stakeholders globally using a consensus-seeking approach. Overall, it seeks to create globally accepted sustainability principles for for-profit, nonprofit, and public sector organizations. By using sustainability reporting, organizations are able to continuously account for, understand, manage, and report on their favorable and adverse economic, environmental, social, and governance performance (GRI 2016).

Thousands of organizations use the GRI framework to report on their sustainability performance, including nonprofits and public agencies. GRI also publishes sector supplements specific to particular industries to which nonprofits in specific industries can look. Such supplements may also be applied by international nonprofit organizations.

A key step in using a social accounting framework is determining which areas are material and should be measured and monitored. Those that are material would have significant economic, environmental, and social impacts and would affect decision-making. If the items are material, they would be included in the GRI report. The GRI framework provides guidance for reporting on over 90 indicators in six key areas: economic, environmental, human rights, labor, product responsibility, and society.

### Stakeholder Impact Statement

New models of social accounting are continually being developed. One of these is the stakeholder impact statement, which is derived in part from the social return on investment framework (Mook et al. 2015). Financial and social data are combined and reported by stakeholder groups. A stakeholder is defined as any group or

individual who affects or is affected by the impact of the organization. This includes clients, volunteers, employees, funders, donors, suppliers, and the environment.

In the stakeholder impact statement, the resources contributed by each stakeholder group are put in context with the economic, social, and environmental impacts that each group experiences. Financial contributions are derived from the organization's financial accounts, and non-financial contributions such as volunteer labor and in-kind donations are given a monetized value. Economic, social, and environmental impacts are determined by understanding what changes for each stakeholder as a result of their interaction with the organization. These impacts are given a monetized value using a financial proxy and adjusted for attribution and deadweight so as not to overclaim.

## Social Accounting and Social Enterprises

Many nonprofits are opting to run social enterprises as a way to diversify revenue. This is due in part to a drop in charitable contributions as well as an increase in competition for donations and grants. The increase in the number of social enterprises has also come about due to the increase of nonprofit and for-profit joint ventures and the increase in for-profits launching and/or controlling nonprofits for corporate social responsibility.

Social accounting is particularly meaningful for social enterprises as they are organizations with both social and financial goals. Social accounting models help them measure their social impact while also tracking their financial performance. It enables them to be transparent and accountable to their stakeholders and make a case for their effectiveness. Additional benefits are that they can share the results of the social accounting efforts with grantors, project investors, customers, and other stakeholders to help communicate their social impact in order to increase their legitimacy.

Social enterprises around the world continue to pioneer various social and environmental accounting approaches related to their social impact reporting. Examples are social return on investment and blended value accounting. Such systems have been tested to show how they can also be adapted by smaller social enterprises that have limited human and financial resources to invest in social accounting.

## Social Accounting and Enterprise Risk Management

An emerging process that connects to elements of social accounting is enterprise risk management (ERM). ERM is the process by which an organization's board and staff consider the mission and strategic objectives of the organization in order to identify and manage or mitigate the risks inside and outside the organization that may derail the organization from its mission. In short, ERM is a process by which an organization attempts to manage its key risks using a holistic approach that keeps the mission of the organization in focus. A key risk is one that would hinder an organization from achieving its strategic goals, in particular its social, environmental, and/or economic goals.

To illustrate key risks relevant to nonprofits, a nonprofit engaged in healthcare cannot afford to prioritize economic gains at the expense of patients. The regulatory and reputation risks that this could bring could result in the closure of this nonprofit. Some environmental nonprofit organizations damaged their reputation after they prioritized their recycling income projects and felt their income generation was threatened by regulation targeted at reducing waste (Jeavons 1992). On the other hand, a nonprofit that values its environmental programs and fails to value its employees to the point of overworking and underpaying them could lose important human resources and face significant operational risks.

As nonprofit organizations continue to look to ERM to help boost their governance processes, the need to monitor, measure, and report significant environmental, sustainability, and other non-financial risks alongside financial risks will facilitate integrated social accounting. An added benefit is that this integrated approach will also

reduce the tendency for social and environmental performance to be subordinated and separated from financial performance especially as some nonprofits look to copy and operate as traditional businesses.

## Social Accounting and Ethics

Accountants are tasked with generating informative reports to help with the decision-making of various stakeholders. When stakeholders have opposing interests and priorities, accountants have ethical responsibilities to present information accurately and fairly to all. Social accounting, therefore, assists accountants in their duty to provide various stakeholders with information that gives an overall picture of the social, environmental, and economic performance of an organization.

Social accounting helps organizations to promote a culture of ethical behavior by highlighting, measuring, monitoring, and communicating these behaviors. Additionally, an ethical culture is very important for the reputation and credibility of any nonprofit and is key in helping to attract and retain donors, volunteers, or employees.

## Social Accounting and Accountability

Social accounting also contributes to the project of democracy. Although traditional accounting provides some transparency and accountability, social accounting extends this to include social and environmental performance and includes the participation of public stakeholders in the process.

Accountability can be either reactive or proactive. Reactive accountability refers to tracking and monitoring how an organization uses the resources that are entrusted to it. Proactive accountability is strategic and looks to the future to pursue goals such as policy objectives or long-term environmental sustainability.

Social accounting can be designed to support and facilitate both accountability and control. Social accounting supports organizational objectives such as assessing risk, managing stakeholders, image management, public relations, seeking out efficiencies, and maintaining legitimacy. Social accounting designed to support and facilitate the pursuit of societal objectives would include stakeholder rights to information, transparency, openness, and describing the social and environmental costs of economic success.

## Challenges to the Adoption of Social Accounting

Major accounting standard-setting bodies tend to indicate in their mission statements that they serve users of financial information but generally exclude sustainability, social, or environmental accounting. However, this gap is being addressed by the International Integrated Reporting Council (IIRC), a global coalition of regulators, investors, companies, NGOs, standard setters, and the accounting profession. A key component of the IIRC model is the inclusion of value creation in six areas of capital use: financial, manufactured, intellectual, human, social and relationship, and natural capital (IIRC 2013).

As the world is moving its focus from the United Nations Millennium Development Goals to Sustainable Development Goals, even the United Nations has highlighted the importance of better accounting practices as crucial to the measuring and communicating of sustainability goal achievement. Therefore, the assumption that the ethical responsibilities of accountants are limited to financial reporting continues to be questioned by both accounting researchers and policy setters.

Another limitation of current sustainability reporting efforts is that organizations generally do not place their sustainability performance in the larger context of planet sustainability. Incorporating an approach such as The Natural Step Framework may help organizations to report their sustainability performance within the context of overall planet sustainability. The Natural Step Framework starts with an understanding of how the biosphere functions, how society influences and is a part of natural systems, how society threatens those systems, and what organizations can do to limit unsustainable

behaviors. This framework is now used by organizations to guide strategic planning and determine what is to be measured, monitored, and reported on with the planet's overall sustainability in perspective.

Without external regulatory requirements to adopt social accounting, nonprofits may lack the motivation to adopt social accounting approaches. In addition, organizations may lack time, skilled workforce, or financial resources to devote to social accounting activities. Also, the board or key management personnel of the nonprofit may not be familiar with social accounting and may not be convinced of its value thereby withholding their support and even resisting any steps toward social accounting adoption.

## Moving Forward: Education and Skills Development

Nonprofit sector accountants have had, so far, limited involvement in social or sustainability accounting. If sustainability reporting is to advance in the nonprofit sector, professional development in this area is needed. As noted in Mook and Pstross (2013), desired skills include collaboration, dialogue, creativity and innovation, systems-thinking, team work, active listening, stakeholder engagement, group decision-making, conflict management, qualitative and quantitative data gathering and analysis, story-telling, critical reflection, learning from failure, change management, strategic forecasting, and lifelong learning. Nonprofit programs at higher education and professional degree-granting institutions play an important role here by incorporating these types of skills development in their degree requirements.

## Conclusion

Social accounting is a tool that has multiple purposes. Social accounting can help highlight both positive and negative realities that normally are not captured in purely financial reporting. It allows an organization to measure, reveal, and address previously ignored social and environmental aspects of its operations. In addition, it can map out power structures and enable better informed decision-making and policy-setting processes. Sustainability performance and externalities can be shown together with financial information to provide a more complete picture of the impact of the organization's day-to-day activities. For nonprofit organizations, social accounting is a powerful way to drive behavior, demonstrate accountability, and contribute to the democratic process.

### The Intellectual Origins of Social Capital

Nobel Laureate Elinor Ostrom and her colleague Toh-Kyeong Ahn (2003) give proper credit to the Sociologist James S. Coleman (1988) and the Political Scientist Robert Putnam (1993) for bringing the concept of social capital into broad discussion among scholars. They note that few social scientists were aware of the idea prior to their foundational works and that the scope of awareness and extent of adoption in social science research and scholarship were quick to grow (Woolcock 2010). There were a scant two citations to social capital on the *Web of Science* in 1991; in 2001 that number grew to 220. Clearly, something special was featured in the work of Coleman and Putnam to attract the attention of so many scholars, and the social science literature was soon flooded with studies, laudatory and critical alike, on social capital. Researchers in various applied fields such as planning, criminal justice, public health, community development, emergency management, and public education began reporting the results of studies on social capital in their respective fields of research and areas of practice.

What were the insights of Coleman and Putnam that so energized social scientists? Their work served to focus the attention of social scientists on the core idea of *collective action* and bring attention to the need to more fully understand the dynamics associated with its achievement. Particularly in the context of democratic societies and in cultural settings where individualistic perspectives predominate over collectivistic values, the need is imperative to understand why some social units (ranging from neighborhoods, to small towns, to large cities, to entire nations) are able to **act in concert** to accomplish shared benefits and other comparable social units are unable to overcome inevitable differences in perspectives to achieve collective goals. Whether the particular challenge be addressing the needs of displaced families in a local community, the serious temporary shortage of water in a city, the prevention of the spread of a contagious malady in a state, or the conservation of energy in an entire nation, the many autonomous and freely decided individual actions of all persons – if framed in terms of behaviors directed to promote a shared benefit – provide a powerful advantage in sustaining the quality of life of all involved. Since the self-interest of rational individuals would call for them to "free ride" and enjoy the benefit of others reaching out to the distressed families, conserving water, restricting their own movements, and adopting energy-saving practices, WHY is it that some social units achieve effective collective action when it is called for while others do not? The work of both Coleman and Putnam provided timely insight into this important question.

In the case of James Coleman, the major determinant of capacity for collective action is that of the strength of *norms of reciprocity* inculcated and sustained by a combination of modeling and socialization. The great Roman sage Cicero described this key norm with admirable clarity as follows: "There is no duty more indispensable than that of returning a kindness. All men **distrust** one forgetful of a benefit" [emphasis added] (as cited in A.W. Gouldner 1960: 161). For Coleman, the reservoir of *social trust* created and sustained by norms of reciprocity gives rise to collective action when it is needed in a community. Coleman quite correctly noted that communication among members of the community is

easier when trust is present as opposed to when distrust prevails, and similarly mutual assistance is more easily rendered and more likely to be reciprocated when the assumption can be made that nearly everyone will "do their fair share" as opposed to "free ride" on the charitable efforts of others in the community.

For Putnam the importance of reciprocity norms is duly acknowledged, but the focus of attention in his work shifts importantly to *structures and networks*, arguing that "an effective norm of generalized reciprocity is likely to be associated with dense networks of social exchange. In communities where people can be confident that trusting will be requited, not exploited, exchange is more likely to ensue. Conversely, repeated exchange over a period of time tends to encourage the development of a norm of generalized reciprocity" (Putnam 1993: 172). For Putnam, the key source of the reciprocity norm and the major factor determining the volume of the reservoir of social trust are the **density and extent of interconnection among the networks of social organizations** (the "civil society" and NGOs in later literature developed by the United Nations Research Institute for Social Development; see Clayton et al. 2000). According to Putnam, these organizations are more critical to social capital formation than the socialization process with regard to creating and sustaining social trust in a community. He argues that the majority of modeling of reciprocity and most of the growth of social trust occurs in the myriad of social organizations inherent in civil society. He argues further that where such organizations are plentiful and highly interconnected by boundary spanning members, the reservoir of social capital runs deep; where they are few and isolated, that reservoir runs shallow. The capacity for collective action in the former case is great and in the later quite limited.

Once social scientists became familiar with Coleman's discussion of social capital set forth in "Social Capital in the Creation of Human Capital" (*American Journal of Sociology* 1988) and later read and pondered Putnam's highly celebrated *Making Democracy Work: Civic Traditions in Modern Italy* (1993), the process of rapid diffusion of the concept commenced. In Putnam's book on regional government performance in post-WWII, Italy attributes differences in both the level of governmental performance and the overall quality of life in the regions of Italy to differences in social capital; those differences make collective action in response to societal challenges more or less difficult to organize depending upon the reservoir of social trust and reciprocity norms and the density and networking present among organizations. He argued that the facilitation of the coproduction of public goods, for example, is easier in high as opposed to low social capital settings. Governmental admonitions to undertake private actions to promote public interest outcomes (e.g., conserve energy, donate blood at the local blood bank, take part in local elections, etc.) would have a better audience and greater likelihood of inspiring public interest-serving action in high social capital than in low social capital settings.

Soon upon the publication of *Making Democracy Work*, Putnam was challenged to apply his social capital theory to the USA. It was argued that if the theory was a universal social science insight, it should hold in **any** society, including the USA. Moreover, the federal structure of the USA and the "laboratories of democracy" phenomenon attributable to the development of social policy in the nation's states over the course of the nation's history would seem to provide a particularly useful setting for the testing of his theory. This type of theory testing was done in a very large-scale study, generously financed by a combination of major foundations, including the Carnegie Corporation, Ford Foundation, Rockefeller Foundation, Rockefeller Brothers Fund, Aspen Institute, Eli Lilly Foundation, Trilateral Commission, Norman Foundation, and Pew Charitable Trusts. The willingness of so many major granting agencies to contribute to the most well-funded social science study ever undertaken attests to the great popular appeal of the social capital concept. The US replication study was carried out principally at the John F. Kennedy School of Government at Harvard University. Putnam's study led to the publication of *Bowling Alone: The Collapse and Revival of American*

*Community* in 2000. Many public appearances were made throughout the country and abroad by Putnam to explain his findings and sketch out their implications for modern society. Shortly upon the publication of *Bowling Alone*, the World Bank commissioned him to train World Bank researchers at the Kennedy School in applications of social capital theory to the now global economic development process (see the summary of World Bank *working papers* in Grootaert and van Bastelaer 2001).

The focus of attention for Putnam in his US replication was that of the 48 continental US states, and the evidence amassed for the book provided a template for many studies to follow at the county, municipal, and even neighborhood levels. Putnam developed a citizen survey designed to capture norms of reciprocity and social trust and likewise developed methods to assess the density and extent of network connections existing among and between organizations. From all of his work, both in the original two-decade study conducted in Italy (between 1970 and the end of the 1980s) and the follow-up US work conducted during the 1990s, the data collected are available upon request to replicate his work and conduct secondary analysis. One reason for the rapid dissemination of studies on social capital is Putnam's exemplary habit of sharing the data assembled in his work, both before and since he achieved wide public acclaim and great professional recognition (he was elected president of the American Political Science Association for 2001–2002) for his research. As was the case in *Making Democracy Work*, Putnam argued again in *Bowling Alone* that both the differences in state government performance and the quality of life (e.g., economic well-being, state of public health, level of crime, public school performance, availability and maintenance of public facilities and structures) were predictable from the level of social capital present in the state.

Unlike a major theme of *Making Democracy Work* that social capital was a reflection of deep-seated historical legacy, in *Bowling Alone* Putnam argued that social capital could be renewed and effectively expanded by creating inclusive social organizations within communities that model reciprocity norms, develop social trust, and establish bridging networks among one another. Putnam partnered with longtime civic activist Lewis M. Feldstein to coauthor a follow-up to *Bowling Alone* entitled *Better Together: Restoring the American Community* in 2003 (Putnam and Feldstein 2003). At the Kennedy School, *The Saguaro Seminar: Civic Engagement in America* was established as an institutional vehicle for supporting both research into and **active application** of social capital ideas in communities across the USA (and abroad). In due course, many of the applied social science fields drew upon the enthusiasm of the major foundations to test the utility of Putnam's theory and his ideas of how **organizational change** – principally pursuing *greater inclusivity* and *greater internal trust building* through active engagement of members and *more effective bridging to a network* of external organizations – might enhance societal goal attainment and promote organizational sustainability at local, regional, and national levels alike.

## Applications of Social Capital Theory in Social Policy Research and Practice

In short order, applied social scientists began to make use of Putnam's social capital framework in their own areas of study and practice. In their work, the primary questions raised were generally **twofold**: first, is there a demonstrable connection between the level of social capital and quality of social life as predicted by Putnam (e.g., does high social capital lead to more effective planning?) Second, do the *Better Together*-type actions designed to build social trust and promote connections among and between civil society organizations pay off as predicted (e.g., does facilitating interpersonal interaction in the design of communities lead to norms of reciprocity and heightened capacity for public interest collective action?)

From 2000 onward, the literature on social capital expanded greatly in the applied social sciences. For example, in the planning discipline, the academics and practitioners alike were quick to see the value of Putnam's insights, and much of their work serves as a good example of the fruitful

application of social capital theory to the enhancement of collective action capability. Planners made use of social capital-derived critiques of urban sprawl (Williamson 2010), recommended land use plans and ordinances which promoted "walkable neighborhoods" (Lund 2002; Leyden 2003), and wrote about effective, evidence-based practices to build and sustain social capital in disadvantaged neighborhoods (Brisson and Usher 2005).

In the area of criminal justice, the greatest amount of work occurred at the urban neighborhood level where "collective efficacy" (read social capital) was found to be a strong correlate of public safety and citizen sense of well-being, even after controlling for virtually all other socioeconomic and racial factors. It has been reported that investments made in nurturing and supporting civil society organizations, even in "hot spots" of high crime, tend to produce quite positive outcomes (Weisburg et al. 2015). On a national scale, the US Department of Justice launched a two-decade initiative entailing grants and support for university/police partnerships to promote community-oriented policing (COP) across the country. The COP initiative sought to prevent crime and enhance citizen coproduction of public order by engaging the police in building social capital within local communities. A principal aim of COP was to **promote organizational change** within police agencies (too often insular and distrusting) so that those agencies could develop ties to civil society organizations in the communities they served. Programs such as the recruitment of women and minorities officers, DARE and school resource officers, walking and bike patrols, police athletic leagues for youth, officer rewards for participation in community-based organizations, police storefronts and mini-stations, and neighborhood watch initiatives were implemented in many American communities. These COP programs were generally animated by a belief in the value of building social capital through ongoing law enforcement engagement in the community directed toward enhancing the capacity for effective collective action on crime prevention (Pino 2001; Meares 2002; Erp et al. 2007).

Likewise in the area of public health policy, cross-sectional studies at both the US state (Mellor and Milyo 2005) and county level (Lee and Kim 2012; Gilbert et al. 2013) indicate a strong correlation between social capital and favorable health outcomes. Once more, interventions designed to build social capital and promote public health outcomes in many cases have shown quite positive results (Hawe and Shiell 2000; Szreter and Woodcock 2004). Moreover, efforts to promote inclusivity, active collaboration, and boundary spanning networks at the community level in urban areas have shown favorable outcomes even for particularly difficult-to-manage health problems such as drug abuse, violence against women, and child abuse (Darnell and Schuler 2015). In the global fight to halt the spread of HIV/AIDS, the role of social capital has taken a prominent role, with the support of the World Bank (David 2007).

In the area of community development, the social capital concept has become a core principle of theory and practice alike over the course of the past two decades. In the field of rural sociology, scholars such as Cornelia Flora were quick to recognize the value of Putnam's work, and she expanded upon it to identify several forms of social **capitals** needed to help rural communities become sustainable in the face of great social change (Flora 1998). Economists in the US Department of Agriculture responded to requests by many university-based extension social scientists across the country for *county-level indicators of social capital*. In response, Anil Rupasingha and his colleagues drew upon US Census, County Business Patterns from USA Counties on CD program, the National Center for Charitable Statistics, and the Regional Economic Information System sources to construct an index of social capital for all US counties, updated periodically (Rupasingha et al. 2006). Several studies on community development featuring this social capital data have been done in the USA (Martinkus et al. 2014), and likewise, studies have been carried out in developing countries with an explicit focus on social capital formation and maintenance (see overview of US government-supported efforts in USAID documents such as US Department of State 2007).

In the disaster management literature, the connection between preexisting social capital and disaster recovery is considered to be very strong; in point of fact, the most celebrated scholar in the area, Louise K. Comfort, frames the overall problem as one of the achieving critical levels of collective action in times of extreme emergency events (2005). Much of the literature on the aftermath of Hurricane Katrina has been framed in terms of social capital theory (Meyer 2013). The effort to promote disaster management planning has focused considerable attention on the building of social trust and boundary spanning networks as an important element of local efforts to enhance community resilience (Johnson et al. 2013. In an important contribution to the public administration literature, Mary Kweit and Robert Kweit (2004) compared the aftermath of a disastrous flood of the Red River in 1997 in two adjoining cities, Grand Forks, North Dakota, and East Grand Forks, Minnesota. The more effective recovery witnessed in East Grand Forks was attributed in good measure to the high social capital present in that community.

Finally, in the public education area, the association between school outcomes and social capital is well established in the research literature (Muller and Ellison 2001; Dika and Singh 2002; Lee 2010). The payoff derived from building strong partnerships between schools and community-based organizations capable of generating the coproduction of student learning and socialization has been demonstrated in many studies (Morgan and Sorensen 1999; McNeal 1999). The asset of community-level social capital and degree to which school administrators take advantage of that asset have both been shown to be predictors of school performance in systematic cross-school district comparisons in Washington state (Simon 2001).

## Consolidation of Social Capital into the Prevailing Public Choice Framework

As important as the widespread adoption of social capital theory among the various applied social science disciplines and areas of study was, perhaps even more important was the action taken by Nobel Laureate Elinor Ostrom to **incorporate** social capital theory into public choice theory as a major factor in the explanation of collective action – particularly in common pool resource settings. She and her colleague Toh-Kyeong Ahn observed the following about the critical role seen for social capital theory in advancing social science theory and research:

> What explains this rapid growth of the social science literature? The 'standard' approaches to the problems of economic development and political order seem to have reached their limits. Abundant anomalies accumulated that called for careful examination of the factors that were left out of earlier theories. Some of the puzzles, **especially the differential political and economic performance across nations and communities**, could not be answered satisfactorily without seriously studying the omitted factors: **trust and norms of reciprocity, networks and forms of civic engagement, and both formal and informal institutions**... We believe that the concept of social capital should take its place alongside physical and human capital as core concepts of great usefulness to the social sciences. [Emphasis added]. (Ostrom and Ahn 2003)

This joining of social capital theory into mainstream rational choice scholarship in political science opened the door for a great expansion of research in the discipline. A good deal of that research occurred in the environmental policy area where collective action and overcoming the dilemma of the tragedy of the commons is an ever-present challenge. For Ostrom, also a one-time president of the American Political Science Association (1996–1997), the combination of public choice theory and social capital theory offered a means of explaining WHY the tragedy of the commons is **both** a frequent occurrence **and** is sometimes avoided through efficacious collective action (Ostrom 1990). Political scientists eager to explain why seemingly pressing environmental problems were receiving too little attention in most places, but giving rise to effective collective action in others (Grafton and Knowles 2003; Jones et al. 2009; Morris et al. 2015), were turning to social capital theory. They often found evidence that **trust and norms of reciprocity, networks, and forms of civic engagement and both formal**

**and informal institutions** were present in cases of effective collective action (Pennington and Rydin 2000; Weber et al. 2006).

## Path of Social Capital to Public Administration by Way of Business Administration

As the applied social science fields discovered and made beneficial use of social capital theory in research and practice alike, their counterparts in business administration – particularly in the areas of management and organizational strategy – were quick to appreciate the insight that **organizational change directed toward collective action** was indeed the key dilemma to be solved in the management of formal organizations. Whether large or small, whether for-profit or nonprofit, the key challenge for any organization is to accomplish sustained collective action directed toward a shared understanding of the goals of association. In meeting that challenge, the key elements of social capital theory of trust, norms of reciprocity, and dense and interconnected networks of association within an organization and between organizational actors and key outside interests constitute the most central concerns of management *properly understood*. Essential to the process of management viewed through this lens is the balancing of two types of social capital – namely, bonding and bridging. BOTH the "ties that bind" and the "connections across group boundaries" are necessary to sustain progress toward the achievement of long-term goals in any organization. The research and applied social science work done with social capital theory in the public policy settings noted above soon found equivalent applications in the area of business administration theory development and in the area of management practice.

A significant breakthrough in this regard was accomplished in the prescient work of Janine Nahapiet and Sumantra Ghoshal set forth in "Social Capital, Intellectual Capital, and the Organizational Advantage" published in the *Academy of Management Review* (1998). They argued in that prescient article that the ability organizations have to create and share knowledge is the core element of activity that requires conscious management and that *social capital as understood by Coleman and Putnam and Ostrom facilitates the creation of new intellectual capital in organizations*. They argued further that the primary collective action challenge for organizations was to make well-informed choices in the development and management of three types of social capital within an organization – *structural* (connections among actors), *relational* (trust among actors), and *cognitive* (shared goals among actors). Once researchers were alerted to the centrality of social capital to the question of achieving "organizational advantage," the race was on among scholars to enhance this insight and, very importantly, devise empirical measures for social capital that could direct research and guide practice (Williams and Shepherd 2015).

Among the first noteworthy challenges to Nahapiet and Ghoshal, the principal focus on the proper management of the bonding elements within organizations came from some organization strategy scholars. They opined that the utility of social capital conceptualized in its internal structural, relational, and cognitive forms of connection is very likely contingent upon the effective *bridging* to outside networks on the part of key actors in the organization. They used the term "structure hole" to characterize a situation where the intellectual capital of a cohesive organization suffers from **insularity** owing to insufficient connection to extra-organizational networks wherein pertinent knowledge and timely information is being circulated on an ongoing basis (Burt 1997; Ryu 2015).

In due course, researchers in public administration took note of the developments on social capital taking place in the business administration literature and initiated important new research initiatives reflecting social capital theory-based insights for directing organizational change in public and nonprofit agencies (Bryson et al. 2010). Principal among the public administration researchers leading the way in the testing of social capital precepts and employing advances in social science measures and analytical techniques were Ken Meier and Lawrence O'Toole. They

developed measures for all of the core dimensions of bonding social capital and addressed the need to investigate the "structure hole" dimension of bridging social capital by developing some innovative measures of managerial networking (Meier and O'Toole 2001, 2003; O'Toole et al. 2005). Their access to Texas public schools and their educational outcome data for a very large number of schools and students provided a treasure trove of data to be mined. They have been able to explore the potential for (and limitations to) using social capital theory to help guide organizational change in American public education and by extension in public and nonprofit organizations writ large. Their research has, moreover, set a high standard for empirical research in public administration and inspired many young researchers to emulate, build upon, and go beyond their work (Andrews 2012).

## Social Capital and Organizational Change in Appreciative Inquiry

It is perhaps most fitting to end this short piece on social capital and organizational change with an acknowledgment of the increasingly broad use of the "appreciative inquiry" framework for organizational change interventions (see Meier et al. 2007). There has been dramatic growth in interest in the appreciative inquiry (AI) process for organizational audits, evaluations, and planned change initiatives (Cooperrider 1999). Much of that interest stems from the conscious effort made in the AI process to build *bonding social capital* (structural, relational, cognitive) and *bridging social capital* (capacity for boundary spanning) in a process of organizational self-study, deepened holistic understanding, and honest sharing of personal perspectives by all members of an organization (Preskill and Catsambas 2006). The powerful process of crafting and then sharing personal stories of successes attained in work and making connections with others in the process produces a valuable type of intellectual capital which is often transformative for public agencies and nonprofit organizations (Abma 2003; Van der Haar and Hoskings 2004). The power of the AI process, however, lies not in the particular personal stories told but rather in the social capital created by their thoughtful sharing.

To this point, our discussion of social capital seems to point to an unremitting positive, organic force in social and civic life. To be sure, social capital can be significant in facilitating collective action in the public sphere, as well as an influence on the production of public goods. But it is not that unequivocal, and there remain unanswered questions. Thus, even in the presence of bonding or bridging networks bound together by mutual and reciprocal trust among their members, there is nothing automatic about the mobilization of that network to engage in collective or shared action aimed at change in pursuit of the public good.

One early corrective to the seeming consensus on social capital being an unmitigated civic community collective good came in the form of the identification of the "the dark side of social capital." Robert Putnam assesses the potential implications of communities or social organizations with high social capital *and* low levels of tolerance for others (Putnam 2000: 355). In such cases, social capital-induced solidarity can be a vehicle for enforcing intolerance and suppressing dissent. As Putnam writes, "The abundant social capital of the 1950s was exclusionary along racial and gender and class lines" (.358). Elinor Ostrom similarly observes that "There is a dark side to social capital as well as to physical and human capital. Gangs and the Mafia use social capital as the foundation for their organizational structure" (2000: 176). Thus, van Deth and Zmerli correctly note that "the specific consequences of social capital largely depend on political and social conditions" (2010: 631).

Why, then, do some networks activate on behalf of their shared interests or on behalf of what they perceive to be public goods that should be available to everyone regardless of whether they participate in the network's activities? One answer to that question points to the importance of leadership, the presence of individuals who have the skills, and the commitment to invest in activating a network. Surprisingly, relatively little is known currently about the role of leadership in social capital Does it take particular kinds of skills

or attributes to mobilize social capital-based influence? If the networks are trust based, must the social capital entrepreneur be the most trustworthy or simply have a requisite trust-based legitimacy along with the organizational and political skills to develop strategies that will achieve shared goals? One place where growing research is obtained in regard to leadership and social capital has nothing to do with the capacity to use social capital but rather the capacity to build it in an organization (Van De Valk and Constas 2010). Again, though, a question is raised as to what leadership attributes enable an intentional social capital building strategy within an organization? The answer surely is found in the fit of those attributes with the political and social conditions within which they must be applied by the leader.

Exploitation; Governance; Social class; Social evolution; Society

## Introduction

Class or the social class is a frequently used term in many social and economic literatures for which a stable definition is hard to found. The traditional perception of class is based on economic productivity and which disregards shared subjective understandings like race, religion, gender, ethnicity, knowledge, etc. on the psyche of common people. Finding the universal standard for ascertaining and defining someone's social class has proved to be one of the hard nuts to crack among scholars and has ignited debate and contradictions from time to time. The concept of social stratification is a phenomenon that traces its origin back to ancient Greece where society was divided into two broader divisions, namely, the slave and the freeman. Social division was recognized from the very inception of human civilization where commoners were subjected to the leadership of superior hunters during the hunting and gathering age. With the introduction of agrarian society, the concept of social class started to take institutionalized form, albeit in constricted dimension. The feudalistic society experienced the upsurge of two classes, namely, the peasants and the feudal lords. Later on, emergence of capitalism under the shadow of industrial revolution started making social divisions based on their socioeconomic status into three commonly found groups, i.e., the higher class, the middle class, and the lower class. From the context of economic productivity, there were actually two classes, namely, the bourgeois class or the controllers of capital and the proletariat class or the worker class. This artificial division initiated the modern discourse on social class based on labor division and the capacity to income generation. And this is the point from where the class division becomes pivotal in discussing the spiral and complicated relations in between social class and governance. This period also experiences the emergence of democracy as a popular system of governance in the twentieth century's sociopolitical realities which seeks to ensure equality and eliminate discrimination from all spheres of the society. Sorokin wrote that social stratification means the differentiation of a given population into hierarchal superposed class. His major three types of social stratification include economic, political, and occupational class (Sorokin 1959). The traditional concept of social class prevailing in modern society has always been dependent upon the socioeconomic status of individual which has ultimately made the whole concept of social class volatile one. Assessing someone in reference to his/her economic capacity not only depletes the plausibility of such class division but also makes the whole thing quite unscrupulous from broader dimension of social economy. It is pertinent here to mention that assessment of class from private individual's context is the by-product of the prevailing model of economic system which aims at making capitals through triggering consumption behavior upward from individual level. This social division ought not to sustain as collective capacity to contribute toward socioeconomic development has been vehemently disregarded, and the paradigm of development has never been solely focused on individual's capacity rather than increasing capacity from the collective context from a wholesome approach. Thus, the prevailing model of social class is predominantly biased by the accumulation of wealth and capacity to afford social status with such wealth. These two factors in turn create the state of social influence over the others which consequently destabilizes the cohesive and coercive formation of governance structure. Class represent's authority's structure in society and governance

is the exercise of that authority to formulate and execute policies involving different institutions, actors, norms, practices, and values. Hence it is pertinent to find out the linkage between social class and governance. The objective of this article is to analyze into the interactive relationship between class and governance from the sociological perspective.

## Building the Paradigm of Social Class: Marx and Weber in Context

### Weber on Social Class

Identifying the exact paradigm and perspectives of social class has baffled academics across the globe for decades since the inception of modern discourse on class identity in the evolving socio-economic realities. Class is a concept that has several contextual meanings. Class may be defined in terms of simple gradations based on material conditions. The main body of class analysis is based on the Marxist and Weberian approach (Jones 2001). Max Weber's multi-dimensional approach toward social stratifications reflects a composite interplay among class, power, and status. According to Weber, a class situation refers to the typical probability of procuring goods, gaining a position in life, and finding inner satisfaction (Weber 1978). Weber saw class as only one aspect of the distribution of power in society (Breen 2005).

### Social Class from Marxist Point of View

Marx believed that it is essential to analyze social class, its structure, and nature for a proper understanding of capitalism. Marxists affirm that the history of all hitherto existing society is the history of class struggle (Marx and Engels 1969). In terms of dynamics of capitalism, Marx divided the entire social class into two, namely, the bourgeoisie (handler of capital) and the proletariat (labor class). For Marx, the analysis of social class, class structure, and changes in those structures are keys to understanding capitalism and other social systems or modes of production (Gingrich 1999). The center point of ensuring a class-free society is to understand the social class in an orderly manner which is based upon the inequalities of income and standard of living leading to the control of economic and political power. Even though the Marxist and Weberian approach toward social class differs from contextual analysis, they share the common fact of control over economic resources as one of the guiding principle for deciding individual's class. Marx believed that the real control of power is inevitably connected with uneven distribution of wealth creating poverty and initiating the regime of exploitation in which point class conflict or class struggle becomes inevitable for restoring the balance. Marx defined class in term of the extent to which an individual or social group has control over the means of production and referred to class struggle as the "motor of history." He opines that the rise of the bourgeoisie class is essential for preserving this state of inequality within the capitalism. Consequently, it is the exploitation for which social conflict becomes inevitable and the dimension of exploitation envisaged hitherto emanates from solid economic grounds.

### Revisiting the Traditional Perception of Social Class

Defining social class based upon escalating inequalities based on wealth and income makes the whole process of stratification too volatile to accept. For example, a new study completed in Britain has found a model of seven social classes ranging from elite to precariat, and the study concludes that the concept of class has economic, social, and cultural dimensions which make the traditional definition of class outdated (Savage et al. 2013). It is apparent that exploitation has a broader dimension in which economic systems take a fair share, but exploitation can appear in different forms like cultural exploitation, social exploitation. etc. And obviously, there are more other value-based important factors like denial of justice, deprivation of basic rights, and degradation of traditional moral values emanated from such dimensions which contributes significantly toward shaping the abstract and visual formation of exploitation within social sphere.

## Social Evolution: Class and Governance Perspective

Society has been defined as a collection of individuals held together by certain enduring relationship in pursuit of common ends (Mahajan 1988). On the other hand, state is a part of society which formulates public policy in order to preserve mutual rights and benefits. State is necessarily a political organization, society is not. State is the controller of the whole governance mechanism which operates within the perimeter of the society. From the context of historical evolution, human society can be classified into three, namely, the preindustrial, industrial, and postindustrial societies. The term "preindustrial society" has been used in a generic sense, denoting the human civilization before machine manufacturing and mechanization of the society, and which includes the hunting and gathering societies, pastoral societies, horticultural societies, agricultural societies, and feudal societies. It simply refers to social attributes and forms of political and cultural organization that were prevalent before the industrial revolution. The industrial revolution during the eighteenth and nineteenth century, marked with the emergence of capitalism as the driving economic system, initiated the industrial societies where technologies of mass production are used to produce goods in a large scale and which is organized hierarchically by class, and a rigid labor division is prevalent within the society. On the other hand, postindustrial societies experience the transition from production-based economy to service-based economy and which has given birth to efficient concepts like New Public Management (NPM) and New Public Service Management (NPSM).

### Social Evolution and Elements of Governance

From the perspective of authority, morphological evolution of society can be divided into primitive communism, slavery, serfdom, feudalism, and capitalism. The term "primitive communism" is usually associated with Karl Marx, but most fully elaborated by Friedrich Engels, and referring to the collective right to basic resources, egalitarianism in social relationships, and absence of authoritarian rule and hierarchy that is supposed to have preceded stratification and exploitation in human history (Scot and Marshal 2014). Subsequently, slavery came as an economic system which used human, either through coercion or voluntarily, as a trading property and to be sold, bought, or rented accordingly. Human beings were primarily divided into two, namely, the slave and the master (the slave owner/the freeman). Serfdom has been considered as the primitive form of feudalism where the serfs were bound to serve their landowner (agricultural land, mines, and forests) in return of subsistence allowance, social protection, and justice. The feudalistic form of society was the combination of both the legal and military customs under which the status of human being was classified as the peasants and the feudal lord. Feudalism was the medieval form of government predating the birth of the modern nation-state. The initiation of industrial revolution was marked with the emergence of capitalism which refers to the economic and political system where the control of economic affairs lies in the hand of private individual rather than the state. Rigid labor division, private ownership, deregulation, and consumer sovereignty are the prime characteristics of this system. Capitalism is the prevailing model of economic system which has three phases, i.e., trading capitalism, industrial capitalism, and finance capitalism. These three layers can be best described through the example of a person who buys certain consumer goods for selling into the market. This is the first step of capitalism, i.e., trading capitalism. Later on, if he intends to produce those goods through investing labor and exploring market, he is said to enter into the second phase, i.e., the industrial capitalism. At this level, certain risks are associated which may either promote him or drop him from the existing ladder as he is in the control of production line. Consequently after being successful, he intends to disseminate the know-how of the production and finance the others in return of incentives for which he is actually entering into the stage of finance capitalism. Evolution of society has always persuaded man to move forward in compliance with the prevalent governance mechanisms. Consequently, status of human has varied significantly

from one society to another. To assess the evolution of societies from the class and governance perspective, it is needed to put focus on different elements of governance which has faced significant changes in the course of social evolution. The elements of governance that shall be focused in here is goal (personal, group, and organizational), structure and process of cooperation, types and legitimacy of power, production relation (ownership, technology, labor process, and distribution), human relation (man–man and male–female), and interaction with environment (ecological relations and man–nature relations).

### Primitive Communism

In the primitive communism, all the human beings were said to have equal treatment and opportunity and survival was the all encompassed goal. The structure and process of cooperation was mass structured and dependent upon each member's capability. There was a common trend of leader and follower within the primitive social structure. Legitimacy of power was solely dependent on personal charisma and cordial acceptance by all. As to production relations, ownership was community based (shared basis), technology was primitive, labor process was based on mass involvement, and distribution was equal (necessity basis). Male–female relation was primarily based on the natural role-bound theory, and man–man relation was determined on the basis of seniority as to age. As regards the relation to environment and ecology, human society was much closer and dependent upon the nature.

### Slavery

In the slave society, the goal of slave was to be freed from the chain of slavery, and for the master (slave owner), it was the exploitation of slaves. It is the breaking point where exploitation started with the meltdown of natural equilibrium existing within the social structure. Social cooperation was hierarchical where slave owner controlled the sole authority over the slaves. Slavery was started accepting as a social norm. In some places, it was sugarcoated with the religious systems like the caste-based social systems found in ancient India. The dimension of power exercised was in the nature of domination as a coercive force, and it was legitimized through the ability to exercise and inflict violence upon the renegades. As to the production relation, ownership was controlled by the slave owners, labor process was primarily based on forced labor, and the distribution process was seriously uneven and discriminatory. It was the crudest form of social stratification that human civilization has ever experienced. Man–man relation was primarily determined on the basis of slave–master relationship, and the natural rule started to collapse as to male–female relationship through flagrant malpractices like forced sex, gender discrimination, etc. The relation with the environment was insignificantly disturbed at this stage.

### Serfdom

Serfdom was the very primitive stage of feudalism, and this society is significantly marked with the inception of institutionalized form of exploitation through accepting slavery as a normative social practice. Unlike slave society, freedom was availed to the serfs in a limited capacity. The goal of the serfs was to invest in labor and for the landowners increase in productivity. The process and structure of social cooperation were highly hierarchical. Power was based on wealth and strength and legitimacy of that power was established through social norms. Ownership was controlled by the landowner and primary agricultural technology was available. Labor process was dependent on the serfs (which were forced) and distribution was uneven. Human relations, i.e., man–man and male–female relations, were uneven as well. The relation between the natural environment and the human society was disturbed at an insignificant proportion.

### Feudalism

The feudalistic society experienced the emergence of nation-states and the process of surplus extraction begun. The goal of the peasants was to increase in agricultural production, and feudal lords seek for the rents and profits as against such cultivation. Social cooperation and process was institutionalized hierarchically and different agencies like the knights and nobles were created

under the kingship. Power formation was dependent upon wealth and strength; unlike the previous societies, legitimacy was based on the sovereign authority's arbitrary consent. As to production relation, ownership was controlled by the feudal lord, agricultural technology was partially improved, labor process was dependent on the peasants' autonomy who was the taxpayers as well, and the distribution process was not even. Human relation was uneven as the control of economic productivity was based on discrimination. The interaction between human society and environment was significantly disturbed as human beings started to impose control over the natural elements. The decimation of feudal society initiated with the emergence of industrial revolution and capitalism as the leading economic system comes into light.

### Capitalism

From the authority perspective, capitalism has experienced the rise of individualism as the system runs on private control over property and production instead of the state authority. Nevertheless, state works as the regulatory institution having all encompassing and supreme authority over the other institutions. In this system, the proletariats (the workers) aim at a higher level of wage earning capacity, and the bourgeois (capital controller) long for maximizing profits through exploiting their workforce. The structure and process of cooperation is hierarchical, but there is scope of participation and endorsement of welfare attitude within the social interaction. The extent of power is based on pure legal structure and is legitimized through majority acceptance in democracy. But in military states and authoritarian regimes, violence and coercion is the process of legitimacy. The production relation has experienced a significant turn through investing the ownership of production in the hands of capital owner, and the use of technology is way too advanced than the previous societies. Labor process has been categorized as qualified, mechanized, and service based having rigid labor division and with the rise of trade union and welfare societies. The distribution is uneven but need-based nominal supply is ensured. Human relation, i.e., man–man and male–female relation, faces disparity with rising concern over rights issues. As the use of technology is advanced in nature for excelling the growth of production, the interrelation between human and nature is seriously disturbed with grave consequences over the ecology and environment.

So from the dimension of exploitation, the core social stratifications can be narrowed down into two, namely, the exploiters and the exploited. In the social system of slavery, serfdom, feudalism, and capitalism, the exploiters are, respectively, the slave owner, the land owner, the feudal lord, and the bourgeois (i.e., the controller of the capital). On the other hand, the exploited in the parallel order are, respectively, the slaves, the serfs, the peasants, and the workers (i.e., proletariats).

## Deconstructing the Concept: Exploitation and Social Class

Class division exists in line with the prevailing practice of class exploitation within the present socioeconomic system. But like building a castle in the air, all the people belonging to the exploited class remains in a constant illusion of a lofty ambition for more aggressive consumption pattern (like maintaining luxurious goods like a sedan car, an apartment, or things pertaining to extravagance but not necessity). The dream of class struggle has ultimately turned into an unscrupulous competition of getting oneself into the superior class with the opportunity of higher living standard and tacit scope for exploiting the rest of the other. This growing ambition (better calling it as greed) from the social context has turned into a cultural anesthesia which makes the exploited class numb about the way other class exploits them. This numbness ultimately is expressed through their persistent and relentless effort to get upgraded in the social class structure. For example, common television ads depict a farmer's son working overseas or the daughter in the ready-made garments (RMG) sector. From the productivity context, they actually remain where their forefathers were, and the form of occupation

does not upgrade them to a higher and advanced one. Rather then, they enter into another never-ending vicious cycle of exploitation which is another side of the same tool, i.e., exploitation. Consequently, class must be assessed from the perspective and dimensions of exploitation. Exploitation destabilizes social cohesion and creates imbalance. Class is the ultimate outcome of an imbalanced social situation.

## Classifying Exploitation: Intrapersonal Exploitation

Governance is controlled by the upper class, i.e., the exploiter class, and it is the exploiter class which is liable for creating the expressed level of exploitation. Exploitation is a widely contested topic and being ignored or rejected vehemently as a meaningful idea. From the sociological context, the concept of exploitation is usually used to characterize social relations in which an actor or category of actors uses others for their own ends because of a fundamentally asymmetric power relationship between them (Dowding 2011). Exploitation can be broadly divided into two categories, namely, intrapersonal exploitation and interpersonal exploitation. Intrapersonal exploitation is the deliberate or negligent act or omission by any private individual for which liability accrues only to him and resulting in the deprivation within the inner self. It is the violation of the very duties toward oneself for which she/he is bound as a human being. The liability to abide by such obligations rests on the natural phenomena of survival instinct in the evolving social contexts. For example, doing late night activities for a considerable period of time stands in contravention to the biological clock set by nature and continuing this practice may lead to physical as well as psychological unease. Intrapersonal exploitation can be best described as the personal deviation from systematic norms established for centuries by different natural and social elements. In the long run, intrapersonal exploitation creates distraction and thus deviates oneself from attaining his goals and objective which are required for ensuring sustainability at individual level. This is the process of intrapersonal exploitation which impliedly contributes to the divergence of social class from one person to another.

## Interpersonal Exploitation

On the other hand, interpersonal exploitation is the most visible form of exploitation which is inflicted in the form of control by any person belonging to a higher position, in the social structure in respect of power, wealth, and dominance, and to any person standing relatively low. This type of exploitation is commonly found almost in every system prevailing in the living earth, and it can be better understood in the form of the ruling class (the exploiter) that tries to dominate other groups (the exploited ones) in the social structure. Interpersonal exploitation destabilizes the cohesion in every aspect of the society be it economic, social, or cultural. In this form of exploitation, socially dominant positions are flagrantly abused through the means of corruption, nepotism, and all sorts of malpractices which in turn create a culture of exploitation carried on forward for centuries. This long-hauled practice has been decimating the psyche of common people's traditional perception toward social class. From the practical context, this kind of exploitation is signified through increasing level of discrimination at different levels of the social systems, and wealth distribution is one of such flagrant example through which interpersonal exploitation can be best described. On the brink of global economic recession and in the current year, it has been estimated that the combined wealth of the richest 1% shall overtake the rest of the other 99% of people unless the current trend of rising inequality is checked (Oxfam 2016). This economic exploitation in the form of gradual accumulation of wealth has made a bitter perception of division which has been signified through the movements like "Occupy Wall Street" in 2011. As discrimination, inequality, and poverty are all attached through a single string emanating from interpersonal exploitation; it would be quite unwise to assess the paradigm of social class only from economic perspective. Hence, the dimension of exploitation from a broader context can be stratified from impulsive political, economic, cultural, or knowledge factors.

## The Paradigm of Interaction Between Social Class and Governance

### Rules of Nature and Exploitation

Now the question may arise as to the justification of understanding the relation between social class and governance. Class is a natural phenomenon and for which the interrelation between social class and governance is inseparable. Based on historical evolution and development of society, it is essential to explore into that relation with a view to understand and keep the dynamics of equilibrium operational. Even the nature has created balance within its regime of inequality. Nature creates equilibrium, not equality. As nature maintains equilibrium, every natural element is necessarily independent of and interdependent to each other. For instance, killing is seen in the nature because it is neither for extravagance nor for luxury, only for necessity of survival. Nature does not store and gather through depriving others which human society does. Accumulation of property is one of the common attributes of capitalist societies. From human behavior pattern, consumption and surplus extraction has been raised into an abusive level which is absent in the nature. Nature does not accumulate by exploiting others, which our human society is seen to be done. Which behavior or acts can be considered as exploitation is a matter to be judged from the purview of public morality. But consequently, society fails over the social class when the range of exploitation defies the general rules of natural justice and equity.

### Social Class and Superiority

Thus, it is neither possible to deny the class system nor plausible to long for a class-free social system. Class-free society is just another doctrinal dystopia which cannot be implemented within the existing social structure. The whole governance mechanism would fall apart if there was no superiority in the form of class over each other in the society. Superiority is not artificial; it is based upon the exigency of social circumstances. So the concept of class is not something superficial; it is real and that is needed to be perceived from the context of exploitation. Moral and ethical values of human being shall define what should be the dimension of interaction between class and governance. If that interaction follows the rules of nature, the governance mechanism shall stand in compliance with the social stratification. We need to accept the fact that social stratification, class struggle or class conflict, and class exploitations are all real. The concept of social class is inherently and essentially based on class exploitation. Inequality is in everywhere and exploitation refers to the radicalized form of inequality. Hence justice and equitable treatment are desirable. Failure in fostering these normative values may trigger the massive failure of governance in every aspect resulting into the annihilation of present social structure.

## Conclusion

Prevailing class definitions from the socioeconomic context is primarily based upon economically significant factors like income generation, capacity to afford escalating consumptive behavior, economic productivity, etc. Even though it may seem personally derogatory to define someone's class solely on the basis of those factors, they ought to differ from the concept of class developed from modern socioeconomic perspectives. The power dynamic working in here has changed the traditional concept of class up to a significant level. The three-tier division based on economic productivity, i.e., upper, middle, and lower class, has been extinguishing gradually in the evolving landscape of the society and thus unveiling the real sense of social class based on the dimension of exploitation. The preconceived idea of assessing social class on the basis of and within certain economic perimeters has become outdated, and the perplexing paradigm of social stratification has failed to determine any single universal elements on the basis of which social class can be defined. Nevertheless, from the context of developing countries like ours, development partners tend to impose their premeditated concept of class based on capacity of income generation which ultimately divulges the practical value of determining social class. Even their

definition based on economic perception has baffled academics for so long. Nevertheless, it has been observed that in most developing countries, the World Bank's instructions translate directly into policy prescriptions which affect the lives of real people by billions (Islam 2014). Unfortunately, economic approach toward understanding social class has not proved to be very useful in realizing the core problems of our society, let alone resolving them. From the governance perspective, exploitation is the key to understanding social class. Exploitation can only be assimilated with an epidemic which creates anarchy within the social order and frustrates the automatic wheel of development in the long run. The functional mechanisms of governance are controlled and managed by the privileged class and the concept of good governance has come into light due to the deviation of governance, be it expressed or implied, by the upper class i.e. the privileged class. Deviation includes all sorts of corruption and malpractice carried within the shortcomings of the system for achieving personal gain and depriving others from what they equitably deserve to realize from their interaction with the prevailing social systems. Consequently, concept of good governance has emerged and signified in the form of transparency, participation, accountability inclusion, equity, etc. But good governance is not possible through disregarding this regime of exploitation, and good governance requires an operational and good class system. It is obvious that class system creates the chance of dominance and exploitation. Whether one shall abuse his/her superior position over the others in the class structure is dependent upon the normative social values and the prevailing accountability mechanisms from both moral and external dimensions.

# Social Class: Perception and Reality

Jennifer Dineen, Mark D. Robbins and Bill Simonsen
Department of Public Policy, University of Connecticut, Hartford, CT, USA

## Synonyms

Class; Cultural status; Economic; Political

## Definition

A subjectively defined group of people who have similar social, cultural, and/or economic status.

This entry is based on Dineen, Jennifer; Mark Robbins; and Bill Simonsen. 2017. Social Class: Perception and Reality. International Journal of Public Administration. Published online: 27 Nov 2017. https://www.tandfonline.com/doi/full/10.1080/01900692.2017.1399419

## Introduction

During the 2012 and 2016 United States Presidential elections, candidates from both parties competed aggressively for the support of "middle-class" voters. Policy proposals, stump speeches, town hall meetings, national party conventions, and presidential debates all focused on what each candidate argued was in the best interest of the middle class (see Linn 2012; Quinton 2012). Immediately after the 2016 election, *Forbes* magazine referred to Trump's victory as "The Revolt of Middle America" (Kotkin 2016).

While there was a great deal of agreement that the election was focused on the middle class, there was little agreement about which voters were included in the middle, leading Allison Linn of NBC News to ask, "What is the middle class, anyway?," and *National Journal's* Sophie Quinton to comment "President Obama and Mitt Romney agree that this election is all about the middle class. But nobody – including the candidates – can agree on how the 'middle class' should be defined" (Linn 2012; Quinton 2012). In 2016, Trump and Clinton both claimed to be champions of the middle, but each seemed to be speaking to a different group of voters. Trump's message focused on the losses felt by Americans employed in the manufacturing sectors. States with economies that depended heavily on the manufacturing or production of tangibles such as "food, fiber, energy and manufactured goods" went overwhelmingly for Trump (Kotkin 2016). Clinton's messages focused on growth, the environment, and reducing the economic burdens of healthcare, child care, and education (Light 2016). The 2016 election highlighted, to a greater extent than preceding elections, the varying identities falling under the middle-class umbrella. Trump's message spoke to voters with income in the middle-class range but with education-levels and occupations that would be traditionally classified as working class. Clinton's message resonated with middle-class white-collar professionals: highly educated and working in white-collar professions.

Social class is a bundle of concepts that includes, along with economic and social variables, other factors such as people's own histories, identities, and expectations. Americans may share a general understanding of what it means to be middle class in the abstract, but the many aspects of class make it possible to have different identities under the same label. The variables that make up class – education, income, employment status, homeownership, lifestyle, etc. – correlate imperfectly. Trump tapped into the feelings of middle-class voters with multiple identities, appealing to those voters living a middle-class lifestyle but who had education and occupations that typically align with the lower end of the class spectrum. At least in part, politicians tailor their spending plans and campaign promises to cater to the social classes they are courting. For example, the Donald Trump campaign emphasized building a wall between the USA and Mexico and bringing back working-class jobs – consistent with his appeal to white middle-class voters. Understanding the nuances of class becomes even more important to the extent that different classes (or at least those with different incomes) show different demand for public services. Hout (2007, p. 4) suggests that:

> High income people support spending on public universities and roads, for example, but do not think the government should give poor people money. Meanwhile low-income people favor spending more on social welfare programs and drug treatment as well as raising the minimum wage.

This entry examines the middle-class labels that individuals attach to themselves in order to compare them with objective measures and judge their usefulness for classification, policy, and administration.

S

## Relevant Literature

The literature on class includes numerous definitions and spreads to a wide variety of disciplines. Social science owes the intellectual framework of class analysis to Karl Marx, who introduced a formal theory of economic class, and Max Weber, who introduced the concept of social status to Marx's economic theory (Marx 1997; Weber et al. 1946). The study of the American middle class began in the late 1940s but seemed to

crystalize in C. Wright Mill's 1951 book *White Collar: The American Middle Classes.* Mills introduced the concept of two middle classes, a white collar and a blue collar, and began a discussion that continues today (Hout 2007).

Wooldridge and Gooden (2009) trace the underpinnings of social equity in public administration (PA) from Rawls, through Minnowbrook I, to the work done by the National Academy of Public Administration (NAPA). Minnowbrook I was a meeting held in 1967 that laid the foundation for what came to be called the New Public Administration. According to Wooldridge and Gooden (2009, p. 224):

> New Public Administration rejected the idea that administrators are value neutral and recognized a constellation of five normative core values that, although legitimate, can often be conflictual. These values include responsiveness, worker and citizen participation in decision making, social equity, citizen choice, and administrative responsibility.

In 2005, NAPA added social equity as goal two of its strategic plan, recognizing it as the fourth pillar of public administration (with economy, efficiency, and effectiveness) (Wooldridge and Gooden 2009). NAPA defines social equity as follows (as quoted in Wooldridge and Gooden 2009, p. 226): "The fair, just and equitable management of all institutions serving the public directly or by contract, and the fair and equitable distribution of public services, and implementation of public policy, and the commitment to promote fairness, justice, and equity in the formation of public policy."

Social class is a topic important to public administration yet, despite the underpinnings described above, remains underrepresented in the PA literature and in PA curricula. Oldfield et al. (2006) conducted a review of papers published about gender, race, sexual orientation, and social class in major public administration journals in the USA, Canada, Brazil, and Australia. They find few publications on these topics and when they exist, they typically "confine nearly all their social equity writings to race and gender; sexual orientation and social class receive little or no attention" (p. 156).

The issues of class and income inequality should be particularly important to public administrators given that they affect social processes (Oldfield et al. 2006). Oldfield et al. (2006) particularly note that higher education is a classist institution where the students are predominantly from upper-middle and upper-class backgrounds.

Class is a multidimensional concept that includes income, education, employment, and lifestyle variables. While there seems to be an agreement in the literature as to the theoretical notions of class, there is considerably less agreement about how to operationalize the concept. Many fields treat class as synonymous with socioeconomic status (SES) and attempt to measure it objectively by proxy variables or scales that combine variables representing some of these components. Cattell (1942) was among the first to take aspects of social status (prestige rating, intelligence quotient, annual income, formal education) and correlate them with occupation. Cantril (1941), similarly, divided Americans into social classes which he labeled upper, upper middle, middle, lower middle, and lower. Perhaps the best known class index is the Index of Social Position where Hollingshead (1957) combined household address, occupational position of the head of household, and the years of school completed by the head of household. These researchers then grouped individuals and families into classes based on their position on the index.

Another approach to measuring class in the USA is to simply ask Americans to name the class to which they belong. Researchers use subjective social status (SSS) to measure how individuals locate themselves relative to others both socially and economically. This measure is more encompassing than using SES variables or scales because in addition to considering socioeconomic factors respondents can also include other criteria, like social relationships and prestige, in their status assessment. The MacArthur Scale of SSS asks respondents to position themselves, socioeconomically, on a ten-rung ladder relative to other people in a defined community. Individuals are asked to consider their place in relation to others in the community and mark an "X" on the rung on which they stand (Adler et al. 1994). The Social

Class Worldview Model (SCWM) provides a subjective measure of an individual's view of where he or she fits within the social-economic power hierarchy (Liu et al. 2004). The MacArthur Scale and the SCWM are designed for self-administered or in-person interviewer administered instruments. In public policy research, one is more likely to see a measure that asks respondents to place themselves into a social class. For example, Pew utilizes an ordinal five-point measure, asking people to place themselves in one of the following groups: upper class, upper-middle class, middle class, lower-middle class, or lower class. Similar measures are used by Gallup and the National Opinion Research Center.

There is a small body of work that compares objective and subjective class measures. The literature is inconclusive as to whether respondents' subjective class identification mostly aligns with the class as determined by SES variables. Cantril (1941) examined the correspondence of income group to social class and concluded that the two do not correspond exactly. Halle (1984) characterized the connection between objective social status characteristics and subjective status identities as loose and complex. This literature explains the change in alignment as the product of changes to the economy. After the 1980s, changes to manufacturing reduced the number of "high-paying low-status jobs" and gender equity brought changes to the employment status, occupations, and income of women (Hout 2007). Hout (2007) found the link between objective and subjective class most apparent when the objective variables, such as income and education, are all at their highest or lowest values.

Scholars have noted that there are only limited PA-focused research on social class that are published in PA journals. The financial collapse and the social movements that followed, including Occupy Wall Street, make social class research in PA even more relevant. Growing income inequality was a major campaign theme for Democratic candidate Bernie Sanders, and Donald Trump capitalized on the fears of a working class that is increasingly left behind. As mentioned earlier, the middle class is poorly defined, yet the fact that it is consistently invoked by politicians suggests that it has real salience for citizens.

## Recent Work

Dineen et al. (2017) draw on the literature about social class definitions to examine whether people's perceptions of their own social class comport with their socioeconomic status indicators. They do not measure upward mobility between classes; rather they assess class perception compared to existing SES characteristics. Specifically, they ask: Does perception of class status comport to actual observed SES? The research extends Cantril (1941) and Hout (2007) and relates indicators of socioeconomic status (income, education, homeownership, race, and ethnicity) to how people perceive their social class. Because class is a comparative measure – as much about how we view ourselves in relation to other members of society as a summary of our demographics – this paper includes a five-point social class measure similar to those used by Pew and Gallup.

Dineen et al. (2017) use data from a January 2013 University of Connecticut/Hartford Courant Poll. This survey used a national random digit dial (RDD) sample of 1002 adults, age 18 and older. (Field work was conducted by the University of New Hampshire Survey Center). To maximize coverage individuals were interviewed by landline and cellular telephone between Jan. 22 and Jan. 28, 2013. Once a household was identified and contacted, respondents were randomly selected using the "most recent" birthday method. After removing missing data, 960 cases remain. The margin of error is $\pm 3.1$ percentage points. The response rate for this study is 21.8% using AAPOR's RR3 Calculation 3. For a full description of the RR3 formula, see the American Association for Public Opinion Research (2011). Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for Surveys. 7th edition. AAPOR). Respondents were asked to pick from one of the commonly used names for the social class: upper class, upper-middle class, middle class, lower-middle class, or lower class. The survey also included a middle-class perception index.

Respondents were asked about the necessity of six separate items as part of a middle-class life. These items include being able to own a home, buy a new car, save money for the future, buy things you don't need, afford college, and afford vacation.

In addition to the self-identification measure, data is collected on self-reported family income and other socioeconomic status. The survey measured income as a categorical variable that included ranges of less than $15,000; $15,000–$29,999; $30,000–$44,999; $45,000–$59,999; $60,000–$74,999; $75,000–$99,999; and $100,000 and over. The instrument included questions about race and ethnicity, education, employment status, age, and homeownership, as well as other control variables such as party affiliation, ideology, household size, children in the home, and marital status. These control variables help to isolate the influence of the SES variables. Specifically, perceived social class is related to the following SES variables: income, level of education, race, ethnicity, age, homeownership, and employment status. Variable definitions and full question wording and response options for class and the middle-class index items are available in Appendix A.

## Findings

As might be expected, when asked to choose a class identity, the modal response is middle class – in fact, about half of respondents (50.5%) make this choice. That said, when including lower-middle class (19.9%) and upper-middle class (17.4%) in the definition, about 88% of respondents identify as middle class.

Table 1 (below) displays how respondents sorted themselves into the categories of social class and the income that they reported. Each column represents a social class given by a respondent, and the percentages reported in the column reflect the proportion of those in that category that come from a particular part of the income distribution (columns sum to 100%). For example, 18.71% of those identifying themselves as belonging to the middle class had incomes of $100,000 or more.

When regressing social class on SES, the patterns formed by the statistically significant determinants tell an interesting story (The regressions are not shown but are available in Dineen et al. 2017.). Respondents' perceptions of social class, while generally shaped by income, are not entirely consistent with strict income-based definitions of social class. This is perhaps most clear for the income and middle-class relationship. Respondents in the three household income categories spanning $45,000–$99,000 are significantly more likely to think they are in the middle class. However, the $75,000–$99,000 category is much more likely to be upper-middle class strictly looking at the existing income distribution. Similarly, individuals with household incomes over $100,000 are

**Social Class: Perception and Reality, Table 1** Income and social class

| | Respondents identifying themselves as belonging to a social class, (percentage in each income category) | | | | | |
|---|---|---|---|---|---|---|
| Annual income category | Lower class | Lower-middle class | Middle class | Upper-middle class | Upper class | Don't know |
| $0–$14,999 | 39.29 | 11.89 | 4.09 | 0.65 | – | 6.67 |
| $15,000–$29,999 | 27.38 | 20.54 | 6.67 | 2.58 | – | 6.67 |
| $30,000–$44,999 | 10.71 | 18.92 | 10.32 | 1.29 | – | 6.67 |
| $45,000–$59,999 | 4.76 | 11.35 | 12.04 | 7.1 | – | 13.33 |
| $60,000–$74,999 | 2.38 | 8.65 | 12.9 | 6.45 | 8.33 | – |
| $75,000–$99,999 | 1.19 | 8.65 | 12.47 | 11.61 | – | 13.33 |
| $100,000 or more | 1.19 | 3.24 | 18.71 | 52.26 | 58.33 | 6.67 |
| Refuse | 5.95 | 10.81 | 16.34 | 13.55 | 33.33 | 46.67 |
| Don't know | 7.14 | 5.95 | 6.45 | 4.52 | – | – |
| *n*= | 84 | 185 | 502 | 155 | 12 | 15 |

significantly more likely to consider themselves upper-middle class, when by the income distribution they are upper class.

Education follows a logical pattern – higher educational attainment is associated with choosing upper-middle class, even controlling for a person's income. If you own a home, you are less likely to think you are lower class, but homeownership does not relate to other social class categories. This is not surprising, as 76% of respondents report that owning a home is important for a middle-class lifestyle. Unemployed individuals are more likely to categorize themselves as lower class. This is also not surprising since "Being able to save money for the future" was an important middle-class characteristic for about 85% of respondents.

SES observable characteristics are related to individuals' perceptions of social class but imperfectly. This is likely due to how pervasive the notion of membership in the middle class is. It seems the term has become a more generic expression of someone's attachment to society. Perhaps to be American is to be middle class.

In sum, the results paint a picture consistent with Hout's (2007) suggestion that perceptions of class are tied to individuals' personal stories. People from a wide variety of backgrounds consider themselves middle class. Income is correlated with perception of class, as expected, but so are other individual traits, such as education, homeownership, and employment. Regardless of race, the overwhelming majority of Americans place themselves in some form of the middle class.

## Discussion

This entry explores the extent that individuals' perception of their social class comports with objective measures of socioeconomic status. The results show broad distributions in the different measures of class, suggesting many varying ideas of what class means in our society. The data suggests that income is skewed when it comes to class – that is, more income is perceived to be needed than would be supported by the existing income distribution. This conclusion is supported by the results for the questions about the upper limit of income to still be considered middle class. Whereas the median household income in 2013 was about $51,939 (DeNavas-Walt and Proctor 2014), about half of respondents view income over $100,000 as the upper limit beyond which middle class becomes upper class.

The responses of survey respondents here are entirely consistent with what you might expect from those who covet the inclusion and promise of the status that they attach to "middle class" but who have no interest in a taxonomy that might leave them out of it. For them, the label is not an income measure or a place in some distribution but represents the self-identification of those who feel they are like most people, not at the top and not at the bottom. So what is the problem with adjusting our notions of middle class to include all of those who would place themselves into it? It poses a few problems we can contemplate for popular culture and identity. Perhaps it is desirable for everyone in society to believe that they are the same as everyone else in some domain. But in the worlds of policy and administration, this lack of precision can affect the signals we send ourselves about what problems truly lay before us that need attention.

Robert Reich (2017) recently opined that the "[t]he greatest threat to Western liberal democracies in the future is more likely to come from extreme inequality than from Islamic extremism." That is a strong opinion but one based on something we can measure. Scholars, administrators, and analysts may be better off with an income-based definition of the middle, which allows for consistent measurement and affords the ability to reveal potential policy problems. Pew uses an economic definition of middle class, "defined as adults whose annual household income is two-thirds to double the national median" (Pew Research Center 2016). This is a more satisfying measure than something like the middle-income quintile because it allows researchers to observe changes in the size of the middle class. By this (Pew) definition, the middle class shrank from 2001 to 2014 from 55% to 51%. This has implications for social equity and the administration of a just society because as households continue to move toward the tail of this

distribution, their economic interests diverge more and more profoundly. While the vast majority of citizens may believe they are middle class, fewer of them are by this reasonable measure. Such measurement makes it possible to have informed conversations about the implications of things like income inequality, which scholars and advocates often cite as a threat to society.

If the use of middle class has transformed to mean "neither affluent nor destitute" or "just a normal American," then it is also weak as an organizing idea for advocacy. Programs justified with the expressed motivation of moving people into the middle class are not going to have salience and broad popular support if the potential beneficiaries believe they have already achieved this status. The vast majority of United States residents appear to consider themselves middle class. This fact in itself, however, does obviate the very real distribution of need in the country.

If everyone is in the middle, no one is in the middle. Once separated from an income or education construct, the idea of middle class loses any objective scholarly or policy utility. With 88% of Americans in the income distribution identifying themselves in some way as middle class, there is little classification power left in the term, particularly as the midpoint of any economic distribution around which policies can be targeted to improve quality of life.

## Conclusion

Social class is important to study, and much work remains to identify how SES relates to it. Future research that teases out these other concepts, such as individual's histories and perceptions beyond observable SES characteristics, would add substantially to the literature.

## Appendix A Question Wording

### Class Perception

"If you were asked to use one of these commonly used names for the social classes, which would you say you belong in? The upper class, upper-middle class, middle class, lower-middle class, or lower class?"

1 UPPER CLASS
2 UPPER-MIDDLE CLASS
3 MIDDLE CLASS
4 LOWER-MIDDLE CLASS
5 LOWER CLASS
98 DON'T KNOW/NOT SURE
99 NA/REFUSED

### Middle-Class Perceptions

"Being in the middle class may mean different things to different people. For each item I name, do you think it is or is not a necessary part of being considered a member of the middle class?" IF NECESSARY: "Is this a necessary part of being considered a member of the middle class?"

1 IS NECESSARY
2 IS NOT NECESSARY
98 DON'T KNOW/NOT SURE
99 NA/REFUSED

(ROTATE Questions)

"Being able to own your own home."

"Being able to save money for the future."

"Having enough money to sometimes buy things you'd like to have, even if you don't absolutely need them."

"Having enough money for vacation travel."

"Being able to buy a new car from time to time."

"Being able to afford college."

# Social Compliance and Governance

Mohammad Hasan
University of Dhaka, Dhaka, Bangladesh

## Synonyms

Bangladesh; Governance; RMG; Social compliance

## Introduction

In its long journey, the readymade garment (RMG) sector in Bangladesh has been making its way through various challenges on compliance ground. Interestingly the sector has been maintaining a steady growth rate. The industry has ensured the highest job opportunity especially for the least privileged women folk of the country. As foreign currency earner, the industry ranks number one and has been maintaining this status for years. Bangladesh has emerged with the image of exporting nation passing away from being a bottomless basket case (Kissinger et al. 1974). The sector opened up employment opportunities for many more individuals and experts, from home and abroad, through direct and indirect involvements, which eventually helped the country's social development, women empowerment, and poverty alleviation. With all those achievements, the sector is blamed, nationally and internationally, for failing to ensure workplace safety and workers' rights.

The intensity of violations and its consequences that Bangladesh RMG sector experiences did not happen in any other country of the world and have surpassed all the previous records. Although the sector has been laying golden eggs (Abdin 2008), governance of the same remains an issue, as always, that is negatively perceived both in home and abroad. The incidents in different times have given the sector an identity of sweatshop RMG sourcing country

though there are many factories with international standards. Negative publicity surpasses positive activities of the sector due to lack of proper policy guideline and its execution. Hence, no matter whatever the policies and laws that back the sector, if not implemented properly, shall not yield any result in this regard. Also only policy making and formulation of favorable rules and regulations cannot ensure in reducing uncertainties arising from these weaknesses. The government and all concerned decision-making bodies must put their sincere and utmost efforts toward developing ways through which effective implementation of rules and regulation is possible (Begum and Ahmed 1999). Now, obviously questions arise about/on its governance system and how it works.

The contributions of RMG sector are well recognized and praised by all, and especially governments in different terms were very concerned about the export growth and employment generation. There is no doubt about the sector's contribution in terms of foreign currency earnings and employment generation. But the proper attention on employees was absent from the very beginning in general with some exceptions. The workers, behind the growth, were not fairly treated in terms of financial and nonfinancial packages, as remittance attracts more than the remitters. In most of the cases, basic aspects of human rights were not addressed until it was a pressure from the buyers. Devastating and repeated fire accidents in the factories; loss of workers' lives; gross violation of workers, generally human rights; massive labor unrest on wage and workplace safety; and employment of child labor attracted the customers' attention. For the sake of the business, buyers were compelled to impose nonproduct requirement, social compliance, which should be addressed compulsorily.

**Social compliance** particularly refers to the process of complying with labor rights and workplace safety and standards.

**Readymade garment (RMG)** broadly stands for the activities from cutting, sewing, and finishing to making the garment in accordance with customer's specifications.

## Legal Framework of Social Compliance

Every industry has to maintain some legal procedures endorsed by the laws of the land. As an export-oriented industry, RMG has to go through some legal procedures which differentiate the sector from others. Simultaneously, the sector enjoys some privileges as the sector earns highest rate of foreign currency and generates highest number of employment especially for the women. The legal issues of the sector derived from the Constitution of the People's Republic of Bangladesh, International Labour Organization (ILO) conventions, the United Nations Universal Declaration of Human Rights, and WTO agenda on workers' rights. As a member country of the ILO, Bangladesh has so far ratified 7 fundamental conventions out of 8, 2 governance conventions (priority) out of 4, and 24 technical conventions out of 177 (Fig. 1).

## Constitutional Guarantees

The Constitution of the People's Republic of Bangladesh was adopted by the parliament on

**Social Compliance and Governance, Fig. 1** Legal framework of social compliance

4 November 1972 (the day is observed as the constitution day) and it was effective from 16 December 1972 on the first anniversary of the "victory day" of Bangladesh. The constitution is the best safeguard to protect and respect human rights. Bangladeshi citizens have 23 fundamental rights under the Constitution of Bangladesh, Part 3, Article 26–47A. Equality before law, no discrimination on grounds of religion, etc., along with prohibition of forced labor and freedom of association are the other fundamental rights.

## ILO Conventions Ratified by Bangladesh

Bangladesh has been a member country of the International Labour Organization since 22 June 1972 and has ratified 34 ILO conventions including seven fundamental in three different categories (7 fundamental conventions out of 8, 2 governance conventions out of 4, and 25 technical conventions out of 177). The government plans to ratify ILO Convention 138 on minimum age that will bar children below the age 15 years from employment in any economic sector.

Out of eight fundamental conventions of the International Labour Organization (ILO), Bangladesh ratified 6 till 2000. The ratified conventions were on forced labor, freedom of association, right to organize and collective bargaining, equal remuneration, and discrimination. In the year 2001, Bangladesh ratified one more fundamental convention, i.e., worst form of child labor. In ILO Convention 138, minimum age was not yet ratified. Bangladesh also ratified UN convention on the rights of children. Bangladesh also ratified UN convention on the rights of children. In the year 1948, the United Nations declares a set of 30 common standards on human rights applicable universally (the United Nations Universal Declaration of Human Rights, 1948) for all the people of its member states.

## Third Party Standards on Social Compliance

When public regulation is absent or weak in manufacturing countries, the stakeholders at the top of the supply chain, the buyers, and the government of the importing country take the lead of social compliance in the manufacturing end. As a single largest importing country, the USA initiated child labor elimination from manufacturing process through Harkin's bill in 1992 and formulated guidelines for the buyers and importers through the Apparel Industry Partnership Agreement in 1996. As a result, apart from international commitments and national statutory framework, there are social compliance standards formulated by different nongovernmental, international organizations commonly known as third parties. These standards are also derived from ILO conventions, the UN Universal Declaration on Human Rights, and international best practices. In the real field, the social compliance standards are measured based on those third party standards. On behalf of the buyers, under the membership of their platforms, this third party conducts the social compliance audits and issues the certificates or approvals for production of their members' buyers. There are different accepted audit standards by different brands. They are shown in Fig. 2.

Only WRAP and SA8000 certify the factories, whereas FLA certifies brands, not factories. Over the period, these standards upgraded its codes in response to global- and country-specific crisis. It can be mentioned that building and electrical safety was not even on buyers' checklist until Tazreen Fashions and Rana Plaza collapsed.

## Buyers' Codes of Conduct (CoCs)

Beyond international organizations, national laws, or third party standards, every buyer has

**Social Compliance and Governance, Fig. 2** Common third party standards

| Standard | Year |
|---|---|
| SA8000 - Social Accountability International (SAI) | 1997 |
| Worldwide Responsible for Accredited Production (WRAP) | 2000 |
| The Business Social Compliance Initiative (BSCI) | 2003 |

their own codes of conduct based on organizational corporate social responsibility (CSR) policies and commitments toward humanities, societies, and most importantly for their customers.

In buyers' codes of conduct, ethical practices are always top priority in line with ILO conventions and UN declarations. Implementation of their codes by the suppliers and subcontractors is irrevocable precondition for business. Most buyers have developed their own codes of conduct; these usually go beyond the requirements of the national legislation of the sourcing countries and the general CoCs. The buyers' CoCs cover social, technical, security, and environmental aspects; hence, for audits against buyers' CoCs, suppliers usually face the audits in all the areas. Most buyers outsource third party auditors such as international inspection and testing agencies like Société Générale de Surveillance (SGS), International Talent Support (ITS), Bureau Veritas (BV), etc. Most of the big companies have branch offices in their sourcing countries and with their own auditors directly audit their suppliers. The auditing modalities vary from buyer to buyer.

Most of the brands developed their codes of conduct for their supply chain in line with universal declaration of human rights, ILO conventions, and companies' policies on social responsibility (Fig. 3).

A factory working with Tesco, a British multinational grocery and general merchandise retailer, has nominated the Supplier Ethical Data Exchange (SEDEX), a UK-based organization working on social and environmental compliance in supply chains. Société Générale de Surveillance (SGS) is a multinational company headquartered in Geneva, Switzerland, which provides inspection, verification, testing, and certification services worldwide and is one of the authorized inspection companies for SEDEX. Tesco, like all other buyers, has internal audit team, apart from external audit, who are in regular surveillance of factory activities.

## Statutory Framework: Bangladesh Labor Law 2006

The laws enacted in the British era continued during Pakistan's regime, and even those laws were retained after the independence of Bangladesh in 1971, by the then government through the Presidential Order No. 48. The industries were nationalized with the declaration of a labor policy in 1972. In May 1972, right to strike and collective bargaining was prohibited for 6 months by Presidential Order No. 55. In 1973, the right to strike and lockout was withdrawn which was allowed in the Industrial Relations Ordinance (IRO), 1969. In 1974, under the "Emergency Power Ordinance," the democratic rights of workers' trade union activities such as strikes, lockouts, and collective bargaining were prohibited. In 1975, the first military government declared Industrial Relations (Regulation) Ordinance and imposed restrictions on the rights of collective bargaining and striking. In 1977, the rights of freedom of association was liberalized to some extent through the Industrial Relations (Amendment) Ordinance. In 1980, the right to freedom of association was restored with the declaration of the labor policy. Bangladesh again came under the military government in 1982, and all the rights of workers were suspended by the declaration of the Industrial Relations (Regulation) Ordinance. The scenario did not improve until the democratic government came into the power in 1991. By the time, there were already thousands of factories in the RMG sector with more than five lacs employees. A consolidated and unified version of labor laws, instead of 46 existing backdated laws, was a crying need to protect the workers' rights and to

ensure safe working condition of this huge sector. Till 2006, before enactment of Bangladesh Labor Act, 2006, no major development took place in the history of labor legislation.

During the 1990s, the employees and trade union federations placed a demand to the government to simplify labor laws to make a comprehensive but single labor act. The government responded to the same and formed "National Labor Law Commission" in 1992 consisting of 38 members headed by Justice Abdul Kuddus Chowdhury. A questionnaire was framed by the commission and sent to the different stakeholders, i.e., the employers, workers, collective bargaining agency (CBA) leaders, and nongovernmental organizations (NGO) to get their views and recommendations for amending the then labor laws. Within 2 years' time, the commission submitted

| Core areas | Contents | Legal provisions |
|---|---|---|
| Employment | Appointment letter, Service book(5 & 6) | Issuance of appointment letter, identify card, and maintain service book are must |
| | Child and Adolescent (34) | No child is allowed to any form of work, An adolescent with certain terms and conditions |
| | Working Hours (100 )<br>Holidays (103)<br>Leave (115–118) | 48 hours per week: 8 hours day, 6 days week, Overtime should not exceed 12 hours a week, Must not exceeded an average of 57 hours per week in a given 12 month period. At least 11 days paid festival holidays, 10 days Casual, 14 days Sick and Annual leave 1/18 days |
| | Maternity benefits (45–50) | 8 weeks + 8 weeks leave with payment |
| | Wage and payments (120–137) | Within 7 working days of next month as declared by wage board |
| | Separation from Employment (20–28) | Termination, Discharge, Dismissal, Retrenchment, - Resignation, Retirement on completion 25 years of service or 60 years old |
| Welfare and Social Security | Welfare officer, safety committee, Group insurance, (89–99) | Appointment of welfare officer, formation of safety committee, Compulsory group insurance, First aid appliance, day care center, washing facilities, canteens, shelters |
| | Social Security | Service benefits, provident fund, workers welfare fund |
| Health, Hygiene and Safety | Health and hygiene (51–60)<br>Safety (61–78) | factory must be kept clean, adequate ventilation and temperature, safe structures, fire equipment, emergency exit, drinking water, separate and adequate toilets and washroom. Personal protective equipment (PPE) |

| | | |
|---|---|---|
| Labor Relations | Trade Union (176) | Right to form and to join trade union of their own choosing without previous authorization |
| | Collective bargaining (202) | Trade union shall be deemed to be collective bargaining agent while there is only one trade union. In case of more than one trade unions, collecting bargaining agent will be elected by secret ballot |
| | Participatory Committee (205) | There should be 1 participatory committee. This committee will comprise equal number of members representing the owner and the workers |
| Enforcement | Power of entry, inspection (281) | The competent authority may enter, inspect and examine any undertaking at any reasonable time |
| | Penalty and procedure (283–316) | Whoever refuses or fails to comply with an order passed by the labour court shall be punishable |
| | Director of labour (317) | Government may appoint a director of labor, a chief inspector for the purpose of the Act |
| | Chief Inspector (318) | |

**Social Compliance and Governance, Fig. 4** Core areas of social compliance based on Bangladesh Labor Law 2006

its report to the then Prime Minister Khaleda Zia (1991–1996) on 31 March 1994. But there was no action on that report, and it was the same even during the period when Sheikh Hasina (1996–2001) led government. Again the Khaleda government came into the power (2001–2006), and the Bangladesh parliament passed the labor bill in 25 September 2006 immediately before her tenure ended. The main opposition party (Bangladesh Awami League) walked out the parliament and termed the law a "black law." The labor leaders remarked the law as "a law by the owner, for the owner." The Sramik Karmachari Oikya Parishad (SKOP) observed a daylong strike in October 15 in protest of the newly passed labor law. With all those oppositions, the government passed "Bangladesh Sromo Ain 2006" (Bangladesh Labor Law 2006) on 26 September 2006, which came into effect on 11 October 2006. The new act replaced 25 previous legislations and consolidated the provisions of the replaced laws into a single act. In the year 2006, the sector already created employment of 2.2 million workers in its 4220 units. Just after 3 months of the enactment of the Bangladesh Labor Law 2006, an emergency was proclaimed on 11 January 2007 by the military government. Again political and trade union activities and collective bargaining were banned, which continued for around 2 years. Fact is that the frequent interferences hindered the development of a healthy and congenial atmosphere of industrial relations system in Bangladesh (Fig. 4).

As a part of global supply chain, RMG manufacturing is subject to acceptance of CoCs set by the buyers on different aspects on social and technical toward labor standards and decent working condition in workplaces.

## Declaration of Minimum Wage

At regular intervals, workers of RMG are being focused on the spotlight of international media because of their unruly agitation to materialize very logical demand – wage adjustment and

| Year | Minimum wage (BDT) | Grade | Remarks |
|---|---|---|---|
| 1985 | 627.00 | Unskilled | |
| 1994 | 930.00 | 7 | Basic x 30% HR + MA BDT 150 |
| 1997 | 1550.00 | 7 | Not accepted by the owners |
| 2001 | 1200.00 | 7 | High court declared illegal |
| 2006 | 1662.50 | 7 | Basic x 30% HR + MA BDT 200 |
| 2010 | 3000.00 | 7 | Basic x 40% HR + MA BDT 200 |
| 2013 | 5300.00 | 7 | Basic x 40% HR + MA 250 TA 200 FA 600 |

(HR = House Rent, MA= Medical Allowance, FA = Food Allowance)

**Social Compliance and Governance, Fig. 5** Minimum wages in different periods (HR = house rent, MA = medical allowance, FA = food allowance)

enhancement. After serious and series of confrontations, damaging industrial relationship and image of the country, a temporary solution had been taken. Parties concerned, business associations or government, are not willing to find out the root causes, resulting in having no permanent solution for the unrest.

To earn more profit, buyers add design in their style, and manufacturers use different techniques to enhance productivity, but the fight for "minimum" wage goes on. The rate of minimum wage in Bangladesh is one of the lowest among the competing countries. In 1994, the industry already reached at $ 1.5 billion export and drew national and international attention due to workers unrest on different issues mainly on wage. After 11 years of establishment of the BGMEA, the first minimum wage board constituted in 1994, and a minimum wage of BDT 940 per month for garment workers was fixed. To address the criticism from different sections of people in home and abroad, after 3 years of its first declaration, the government refixed the minimum wage as BDT 1550 per month in 1997. The owners of the factories did not accept the government proposal, rather they demanded for the establishment of a minimum wage board. In July 2001, the government declared a minimum wage structure for the private sector workers fixing BDT 1350 as the minimum monthly salary; again the employers rejected the proposal of the government. A member of the association moved to the High Court, and the High Court declared the government order illegal on technical grounds. It took another 12 years to declare the second minimum wage board, which was formed in 2006, after workers had to raise their voice and had to show down the same agitation and demonstration to revise their wages (Fig. 5).

After establishment of the Minimum Wages Board, it recommended or re-recommended minimum wages of the 42 industrial sectors. In Bangladesh, different sectors have different wage levels according to the sector's essence and job nature. On the contrary, the Bangladesh Export Processing Zone Authority (BEPZA) declares the same for the industries inside export processing zones (EPZ).

## Conclusion

Social compliance is a complex cycle; it depends on several crucial things, which are linked together as a chain. A chain is as strong as all of its rings are. Similarly, a chain is as weak as one of its rings is weak, i.e., one single ring is more than enough to make the whole chain system dysfunctional. This example is justified in the case of RMG industry because this sector has several things attached to it and all are interdependent. The supply chain is mostly controlled by the

buyers who control the business. The supply chain is mostly controlled by the buyers who control the business.

# Social Consequences of Bureaucracy

Benson Matipa
Mwense District Administration,
Mwense, Zambia

## Synonyms

Effects; Community and management

## Definitions

| | |
|---|---|
| Bureaucracy | It is the structure and set of rules that control the activities of people that work for large organizations and government. It also entails excessively complicated administrative procedure. It is characterized by standardized procedure (rule-following), formal division of responsibility, hierarchy, and impersonal relationships. |
| Consequences | A result or effect, typically one that is unwelcome or unpleasant. |
| Social | It means an informal social gathering, especially one organized by the members of a particular club or group. |

## Introduction

Bureaucracy is an organizational form that became dominant in business, government, and other arenas during the nineteenth and twentieth centuries. Since then, extensive debates among sociologists and others have centered on its social impact, rationality, and nature. The aim of bureaucracy is to standardize all activities within the organization and ensure that control passes from the top to the bottom. As such, owners and senior managers are allowed to control the organization in a more efficient and indirect way thus mitigating the risk of self-conflict and loss of control of the affairs of an organization. Nevertheless, excessive bureaucracy makes public organizations more arthritic and self-serving, hence rendering them less able to achieve their core missions and less responsive to service users due to nepotism. Bureaucratic institutions are characterized by red tapism, excessive paper work, fear of innovation, poor customer service, duplication of working procedures, strict adherence to procedures, weak management practices, low morale, etc. This has resulted into many people nowadays having a negative perception of bureaucracy because it is rigid and responds slowly to environmental changes and that it relies heavily on rules and procedures.

## The Concept of Bureaucracy

Bureaucracy is derived from the word bureau, which refers not only to a writing desk but to an office or a workplace, where officials worked from (New World Encyclopedia 2017). The concept of bureaucracy and administration is much older. Perhaps, bureaucracy is one of the most enduring institutions of governance and

administration that have survived several millennia (Farazmand 2010). Bureaucracy as an ancient institution of government and administration can be traced as way back as in the administration of great Empires such as Persian, Egyptian, Chinese, Prussian, and Indian civilization (Beyer 1959; Farazmand 2009a). The Persian bureaucracy was the pioneering among the ancient bureaucracy. The earliest origin of Persian bureaucracy can be traced way back as to the ancient Susa and Sumer (which were ancient civilization and historical regions in southern Mesopotamia and Babylonian) (Farazmand 2009b). The bureaucracy of the Persian Empire was a strong institution of administration and governance with high expertise and prestige under the political control of the King or Emperor Cyrus who started ruling in 559 B.C (Farazmand 2009c).

Three major powers preceded Persians in Iran: Susa, Elam, and Media. Medians captured Nineveh, the capital of Assyria, by totally absorbing the Elamite Empire by 600 B.C. The bureaucracy under Medes was characterized with role specialization, organizational hierarchy, and a unity of command system. After conquering the entire known world of antiquity, the Persians changed the world's political and administrative history forever and established themselves as masters of empires, bureaucracy, government, and public administration. The Achaemenid Empire was organized hierarchically with the Sovereign King at its head, his court, a highly effective and efficient administrative system with a professionalized bureaucracy, a liberal governance policy, a formidable army commanded by the great aristocratic nobility, and a multitude of complex institutions of checks and balances (Farazmand 1991).

Bureaucracy has been around for over 5000 years on a small scale under the Elamite (early Iranian) and on a larger scale in the one world-state Persian Empire (559–320 BC). Thereafter, it was followed by the Parthian and Sassanid Persian Empires (200 BC–651 AD) and onward under the Islamic Persian Empire up to the twenty-first century. The ancient Persians as masters of bureaucracy managed the world empire with the most efficient bureaucracy the world has ever known or seen (Farazmand 1994).

The concept of bureaucracy can therefore be defined as a hierarchical organization made up of many departments and divisions that are administered by government workers or a group that makes official decisions based on an established strict process, full of rules and regulations. Bureaucracy is a type of formal administration with the characteristics of division of labor, rules and regulations, hierarchy of authority, impersonality of social relationships and technical competence, etc. The essence of bureaucracy is to enable large organizations to be managed effectively so as to achieve efficiency and be more accountable to the people. Some of the examples of everyday bureaucracies include governments, armed forces, corporations, hospitals, courts, and schools.

## Bureaucracy According to Max Weber

According to the bureaucratic theory of Max Weber, bureaucracy is the basis for the systematic formation of any organization and is designed to ensure efficiency and economic effectiveness in its operations. It is an ideal model for management and its administration to bring an organization's power structure into focus and reality. Therefore in Weber's view, the attributes of modern bureaucracy include its impersonality, concentration of the means of administration, a leveling effect on social and economic differences, and implementation of a system of authority that is practically indestructible (Weber 1978).

Weber distinguished three types of authority, namely, traditional, charismatic, and legal-rational. Traditional authority is based on the belief that rulers have a natural right to rule. Charismatic authority is premised on the belief that rulers possess unique personal qualities by which they are able to control their subordinates in institutions such as religion and heroism (as possessed by Hitler during World War II). The third one is legal-rational authority which is based on the fact that formally written rules keep certain individuals in power. Using a combination of these ideas, Weber developed his own concept

of bureaucracy with five basic distinct characteristics, namely, division of labor, hierarchy of authority, written rules and regulations, impersonality, and employment based on technical qualifications (Weber 1947).

Weber's main concern was that bureaucracies could lose sight of their purpose and begin to act as a special interest group. In other words, they might function for their own sake, rather than to meet some societal needs. Weber was also concerned that the idolization of bureaucracy might stamp out individualism. On the other hand, modern criticisms of bureaucracy have tended to focus on the idea that bureaucracies are bloated, inefficient, and overly expensive, making them ineffective in meeting people's aspirations.

## Negative Social Consequences of Bureaucracy

Bureaucracy can have negative consequences that impact individuals (both those who contact the bureaucracy and those who work within it) and organizations. People who contact bureaucracies can be frustrated by the excessive red tape that goes with them. Bureaucratic rules which often seem pointless to people coming into contact with them cause delays and other inconveniences. Bureaucrats themselves can also become frustrated with the nature of their jobs as they typically are bound by rules and regulations that deprive them of any room of autonomy to act as they wished (Wilson 1887). Besides, when left with no latitude to deviate from the rules, frustrated employees can become defensive and indifferent to the needs of the people who deal with them. In addition, bureaucracies are inefficient and wasteful. Sometimes, incompetent people have positions because of nepotism within the organization. From the organizational point of view, bureaucracies can sometimes create excessive resistance to change in an organization. People can become obsessed with following the processes of rules and regulations, instead of doing the job most effectively. In this way, the emphasis on strict adherence to rules and regulations that come along with a bureaucracy is very problematic to society.

In developing countries, for instance, it is very disappointing when seeking some services such as the supply of electricity and water for either domestic or industrial usage. Clients have to go through many bureaucratic channels and wait for longer period of time before getting final approval. Sometimes, corrupt officials demand facilitation fees to hasten processes. Further, passport acquisition, registration of lands and tittle deeds acquisition, law enforcement and judicial processes, health services, investment promotion, business registration, salary, and pension processes are all accessed after undergoing through cumbersome procedures that leave clients frustrated in their quest for quality services. In some cases, clients abandon pursuit of these services in midstream due to delays and other forms of bureaucratic insensitivities. Bottlenecks that are associated with quality service delivery have made bureaucracy very unpopular to many people, especially that excessive bureaucracy inhibits productivity and contributes to loss of large revenues to the government. In addition, bureaucracy reduces effectiveness at delivering product or service that the system was designed to. From a consumer or citizen side, it causes a loss of faith that the system is either helpful or that it exists for their benefit. The constant frustration followed by this loss of faith causes people to disengage from the system itself, again, defeating the mission.

Classic bureaucratic rigidity and protectionism are prevalent in many governments. For example, firing poor performers is difficult in government ministries and organizations because of an arduous termination process. As a result, operational efficiency is reduced, and in the end, the community receives poor service delivery from these poor performers who are sustained by the bureaucratic system.

From the entrepreneurial perspective, bureaucratic structures tend to be backward-looking, identifying procedures that worked well in the past. This backward perspective creates a conflict with entrepreneurs and innovators who prefer forward-looking concepts and attempt to identify ways in which processes could be

improved. This is because a rigid bureaucracy reduces operational efficiency over time, particularly compared to rival organizations without large bureaucracies. Losses in efficiency are most pronounced in circumstances where bureaucracy is also used to insulate established power structures from the competition.

Governmental bureaucracies are especially known for proneness to creating paper trails and piles of rules. Mountains of paper and rules only slow an organization's capacity to achieve stated goals as well as cost taxpayers both time and money. Administrators wish to appear busy by increasing their workload through creating paper and rules, filling out evaluations and forms, and filing. In the end they hire more assistants, who in turn require more managerial time for supervision. Therefore, there is always growth in the number of employees in bureaucratic systems of governance especially in government. This results into bloated expenditures on wage bills leaving little financial resources for community development and quality service delivery.

The hierarchical structure of bureaucracies can lead to internal empire-building. Department supervisors may add unnecessary subordinates, whether through poor decision-making or in order to build their own power and status. Redundant and non-essential employees quickly reduce the organization's productivity and efficiency. Besides, absent of adequate oversight, bureaucrats with decision-making power could solicit and accept bribes in return for their assistance. In particular, high-level bureaucrats can misuse the power of their positions to further their personal interests.

## Positive Social Consequences of Bureaucracy

Bureaucracies emerged as society moved into its most developed form, the state. As such, it provides the possibility for government to function effectively and efficiently in leading the larger societies of its citizenry with increasingly complex and diverse ways of life. Beyond government, numerous other social organizations, both in the public and private sectors, have developed bureaucratic forms of leadership which have succeeded in advancing the goals of their organizations. Therefore, bureaucracy is an organizational effective means of meeting societal needs (New World Encyclopedia 2017).

Bureaucratic regulations and rules help ensure that government organizations take appropriate precautions to safeguard the interest and lives of the citizens. Besides, the red tape system of doing business in an organization enables documentation of the process effectively so that, if problems arise in future, data exists to fall on, for analysis and correction. Further, bureaucracies provide job security for employees, such as a steady salary and other perks, like insurance, medical and disability coverage, and a retirement pension.

The impersonal nature of bureaucracy is often criticized, but this coldness is by design. Applying rules and policies strictly and consistently reduce the chances that some people will receive more favorable treatment than others. By remaining impersonal, the bureaucracy can help to ensure that all people are treated fairly, without friendships or political affiliations influencing the bureaucrats who are making the decisions. For instance, a successful university applicant must submit a great deal of paperwork to obtain a government student loan. Therefore, this long, tiresome, and frustrating process promotes equal treatment of all applicants, by ensuring that everyone has a fair chance to gain access to funding. Bureaucracy also discourages favoritism, meaning that in a well-managed organization, friendships and political inclination should have no effect on access to funding.

Despite many actual and potential drawbacks, bureaucracy is the most ubiquitous form of dividing labor among members of an organization, town, state, or nation. It is indeed the hallmark of modern society throughout the world. While bureaucracies may not always function in the ideal form that Weber described, when the people working within the structure live for the sake of others rather than for self-centered pursuits, the bureaucratic system offers the most efficient method of maintaining a social institution (New World Encyclopedia 2017).

Bureaucracies are efficient because the division of labor requires workers to specialize in particular tasks. Over time, specializing makes workers learn how to perform their assigned tasks at a very high level of competence, which results in high productivity and quality service delivery to the people. This is because bureaucratic attributes such as precision, speed, unambiguity, knowledge of the files, continuity, discretion, unity, strict subordination, reduction of friction and of material, and personal costs are normally raised to the optimum point in the strictly bureaucratic administration.

## Conclusion

Weber's bureaucratic model has until recently dominated organizational thinking as the most universally acceptable and globally established form of mass organization. However, bureaucracy now connotes different meanings to different people in the organization. To some individuals, it is nothing but rows of seats staffed almost by faceless people, for example, the members of the public see it such. To others, it is a frustrating encounter with red tapism, as clients do not get needed services as quickly as they would have loved. Thus, the general opinion of bureaucracies tends to focus on their drawbacks and potentially negative impact on efficiency and individual rights. If left uncontrolled, the bureaucracy will become increasingly self-serving and corrupt, rather than serving needs and demands of the society. On the other hand, when those working in bureaucratic organizations live for the sake of others more than for their own individual needs, the division of labor and clear regulation of responsibilities of bureaucracy support the efficient operation of any social institution. It further increases the likelihood of employees to be treated fairly and the organization purged of favoritism, discrimination, and prejudice.

# Social Construction of Corruption in Developing World

Mohammad Sajedur Rahman and
Nurul Huda Sakib
Department of Government and Politics,
Jahangirnagar University, Dhaka, Bangladesh

## Synonyms

Acceptance of corruption; Normalization of corruption; Socialization of corruption

Corruption perception is not society neutral, somewhat a constructed idea that emerges from multidimensional social relationships, and understanding varies in different cultural and social background. In developing nations, public understanding of corruption rooted in historical inheritance and realized in the sociopolitical structural setting of the society. It is crucial to grasp the social reality of corruption in a developing country to take any meaningful anti-corruption measures and understand the social dynamics of corruption that lies in the core of society.

## Defining Social Construction of Corruption

The social construction of corruption can be defined as the collective understanding of a society through which people perceived the notion of corruption and interpret it in a social context. Social construction varies in different societies and determines the behavior of people to understand and interact with corruption. For example, in some developing nations, corruption is seen as help from officials and positively perceived. Ideas, beliefs, norms, and identities in social body campsite the filter through which people perceive and interpret the world (Parsons 2010) and social construction of corruption thus emerged.

## Origin and Instruments of Social Construction

The idea of social construction can be traced to the work of Émile Durkheim and Marx Weber. Durkheim's work on the theory of social fact indicated about human behavior of social control, whereas Max Weber rationalized change in religious understanding of Christianity as the root of capitalism. Corruption, like other social constructed phenomenon, is determined by people's understanding and encounters that give meanings to the idea and create social reality. Therefore, the idea of corruption varies from society to society. It is essential to consider how the issue of corruption is framed or constructed in each context, country, or region (Holmes 2015). Essentially, "corrupt" is what is considered corrupt at a specific place and at a particular time (de Graaf et al. 2010). Therefore, context and locality are vital in constructing process of corruption idea. de Graaf et al. summarized Michael Johnston's idea of the contextuality of corruption, "The meaning of terms like 'abuse,' 'public role,' and 'private benefit' are constructed at a given moment in a certain place, and how and why the lines between public/private, state/society, politics/administration, and institutions/sources of power are drawn" (de Graaf et al. 2010). Language is critical of people's perception and construction of the idea. Construction of corruption can be understood as a social process of learning or socialization of corruption. From the process of socialization, people come across the social norms, beliefs, and understanding of the social phenomenon and learn the social reality of corruption. Acceptance of corruption in societies significantly impacts on the way of socialization process and construction of the corruption reality. In organizations, rationalization and socialization process are mental strategies that enable employees to view their corrupt acts as justified, and it neutralizes the negative feelings that emanate from their participation in unethical acts (Anand et al. 2004). Persuasion from society also can bring new meaning and impact on the construction process of the society. Normalization of corruption in organizations is the process in which people's perception is changed toward corruption. Normalization process of corruption in society gives acceptance of corruption as not a severe problem.

## Social Construction of Corruption in the Developing World

Corruption is seen as a more serious problem for developing countries than in the developed world. Corruption is endemic in developing nations and regarded as a major challenge for development. Akanle and Adesina described the corruption situation in Nigeria as, "Corruption is so pervasive in that country that it would be nearly correct to opine that it is a way of life" (Apata 2019). As most nations from the developing world have lack of institutionalization, weak economic structure,

and absence of democratic consolidation, these countries have fragile capacity to fight corruption, and a culture of corruption persists. There is a perception that corruption is more tolerable in developing nations than the developed world because of their culture. However, it would be wrong to articulate the notion that corruption is rooted simply in a country's culture (Holmes 2015). Malaysian sociologist Syed Hussein Alatas criticized this tendency as Westerners view to look at the developing countries (Holmes 2015). It is argued that colonialism has kept a deep footprint in the developing nations and is one of the root causes of corruption culture of the developing countries. It is noticed that most of the postcolonial countries have a prevalence of corruption that can be seen as a strong correlation between colonization and corruption (Angeles and Neanidisy 2015). Angeles and Neanidisy found the relationship is nonlinear and higher levels of European settlement resulted in more powerful elites and more corruption when Europeans remained a minority group in the total population (Angeles and Neanidisy 2010). In the case of colonialization in African countries, it is observed that the European colonial power systematically uses material inducements to capture the African leadership that resulted as the root cause of corruption culture in the countries (Mulinge and Lesetedi 1998). Moreover, it is criticized that the discourse on African corruption is a Western invention that emerged as a postcolonial construct (Apata 2019).

Nevertheless, underdevelopment, competition for scarce resources, and the sociopolitical structure of the nations are the other determinant factors for the construction of corruptions in those countries.

***Patron-client relations*** are recognized as the defining characteristics of many of the developing nations around the globe. Patron-client relationship/clientelist structure of social relationship suggests that patrons as powerful or influential persons provide rewards and services to weaker persons in return for loyalty and support and also including the reciprocal exchange of some services (The Free Dictionary 2020). This connection thus provides opportunities for corruptions in the social body as an exchange of relationship that often turns into monetary and other kinds of corruptions. As patron-client relations are two-way beneficial, thus the relationship can create acceptance of corruption in a society. Moreover, in the case of development goal, patron-client relationship results differently in different countries. For example, patron-client relations positively liked the political forces in attaining South Korea's economic growth while negatively linked in South Asia (Khan 1998). In election politics, clientelism creates social acceptance for the political process. Clientelism can be recognized as a key mechanism to gain electoral support necessary for political interest to ensure access to the state's resources (Szeftel 2000).

***Neo-patrimonialism*** is another theoretical lens to understand the encounter of modern forces within traditional society in developing countries. Neo-patrimonialism describes the power relationship as a combination of patrimonialism and Max Weberian legal-rational authority that evolved in modern-day political circumstances where personalization of state power is the crucial component of the system. Bureaucracy is used as a legitimate way to gain state resources that constructed the relationship between leadership and state power. The neo-patrimonial state thus can avoid legal framework of state and political corruption become rampant and rationalized.

***The political settlement***, the theoretical method popularized by Mushtaq H. Khan looks in the distribution of organizational power that determines the economic and political effects of institutions to reach an equilibrium point. For developing countries, the tendency toward equilibrium includes informal violations of formal rules to capture benefits informally as many powerful organizations are informally organized in society (Khan 2018). Political stability is maintained by the relationship, and it gives access and acceptance of corruption to society.

## Good, Bad, and Ugly Corruption

Corruption is a crime. However, corruption is not treated as same as other regular crimes, and

punishment is generally less hard than other crimes like theft, hijack, and others. Organized crime as underworld affairs has negative impacts in the mind of people, whereas different corruptions which are considered as a white-collar crime of "upper world" appear less serious affairs to the populace (Holmes 2015). Though the impact of corruption is widespread, a crime like a looting brings more fear to the people than any corruption act. Nevertheless, corruptions are of different categories, and some are considered good, some are bad, and some are ugly. Grand political corruption creates big concern to the society of developing nations as people consider public good has been abused; however, petty corruption as an everyday encounter of the people in developing nations brings little apprehension. Administrative petty corruption is seen widespread in most of the developing countries, and sometimes certain acts of corruption are perceived as beneficial to the people. Bribery as speed money can speed up the services people looking for; otherwise, valuable time and energy can be lost. When people are barred from government facilities unless bribe is not given, people consider it as advantageous. In a patron-client setting, the beneficiaries of a corruption act also can consider as a positive thing because of fulfilling their self-interest. Furthermore, corruption brings the question of helpfulness from a receiver perspective. Two types of corruption can be categorized in this regard: work is done after taking a bribe (bad), and work is not done after taking a bribe (ugly). Akbar Ali Khan, a Bangladeshi economist, mentioned the name of the economy of the second type as "the economy of the sons of pigs," where the corrupt persons betray with the bribe givers (Khan 2017). He cited an experience of Michael Carritt, a British employee of colonial time in India, of encountering a person in court who categorizes the corruption acts in that line (Khan 2017). Therefore, corruption is seen differently from people's perspective in developing world, and a corrupt person can get social acceptance if corruption act is perceived as a help or not.

Corruption is considered as an obstacle for accelerating growth and development. However, for many developing countries, corruption is also seen as a positive force for achieving modernization and political development. Corruptions are considered as natural side effects of development juncture for the developing countries, even enabler of development. Low-level corruption for effective bureaucracy and capital formulation for the entrepreneurs is described to be positively linked to the path of development for developing nations. Moreover, it is found in many patron-client setting that clientelist relation by favoring a network can enhance the efficiency of development projects. Therefore, corruption perception about development is not harmful at all in all perspectives. It is also important to perceive an act of corruption as corruption. In some developing nations within patron-client settings, some corruption acts are an act of kindness from officials, and deals within the network are considered normal. For example, in countries like Bangladesh, China, India or Nepal, gift-giving and issuing favor by public officials within an informal network are considered simply social obligation to help and not seen as corruption act (Sissener 2001). In the case of Bangladesh politics, it is seen that politicians use government resources to enhance the clientelist network for the shake of enhancing political influence. Zahir Ahmed shows that extending help to the people of constituencies has now been used as an act of informal responsibilities of the Member of Parliament (MP) in Bangladesh that is well perceived by the populace (Ahmed n.d.). Therefore, patron-client relations give a different meaning to corruption and give acceptance to corruption. Additionally, corruption can be realized in a dual role of people in the developing world in case that people do not like corruption and think that corruption is hurting them. At the same time, they are involved in corruption when they need to do so. Though people perceive corruption negatively, they can involve in corruption as it is an everyday strategy to survival in the third-world body polity.

## Social Construction of Corruption and Anti-corruption in Developing Nations

"One size fits all" is the core of most of the anti-corruption strategies in developing countries. Most anti-corruption design is adopted following top-up method, ignoring the reality of social understanding of corruption in different societies. Corruption is human behavior, and any anti-corruption needs to be tailored taking local contexts. Institutional isomorphism is one of the approaches that are thought to a productive process as organization characteristics are modified in the direction of increasing their comparability with environmental aspects (DiMaggio and Powell 1983). However, in developing nations, donor prescription for implementing a goal in short time failed to attain a result because countries do not have enough capacity to adopt the program.

Most importantly installing a measure without considering local context may fail. Most of the anti-corruption strategy is donor-driven and considered as the comprehensive formula to gain the result. The bottom-up approach is vital in the fight against corruption of developing nations and thought to be an alternative way of involving people. Lack of political will because of the nature of neo-patrimonial state bars the nations to effectively implement anti-corruption strategies. People's involvement through community-based organizations (CBOs) can be an effective instrument to fight corruption from the bottom as local people know the local perspective of the process of the social construction of corruption. It is suggested that organizations should focus on local innovation and give priority to local contexts to respond to specific problems to prevent everyday corruption (Sakib 2019). As every society is different from its capacity, anti-corruption should consider the social construction of corruption to fight corruption. As de Graaf et al. observed, "Too often, corruption and its remedies are discussed outside its social and historical context. This is dangerous because, whatever way one looks at the causes of corruption, the contingencies are many. Any proposed solution should take as many contingencies as possible into account" (de Graaf et al. 2010).

# Social Distancing

Elizabeth S. Overman[1] and
Kristie Roberts-Lewis[2]
[1]University of Central Oklahoma, Edmond, OK, USA
[2]Southern University and A&M College, Baton Rouge, LA, USA

## Introduction

Diseases do not exist in a vacuum. Afflictions are composites identified by a biological description animating a peculiar cultural context. The ontology is the living organism as a dynamic and animate being. The epistemology rests in the particular historical moment in which the human population recognizes the manifestation of a malady through illness, testing, or death. As articulated by Charles Rosenberg in 1983, "A disease is no absolute physical entity but a complex physical construct, an amalgam of biological state and social definition." The contours of disease mitigation are dependent upon the social description of the disease and the weight it is given in terms of lethality. Highly communicable air-borne infections may be subject to social distancing which is a classical public health nonpharmaceutical intervention intended to prevent the spread by maintaining physical distance between people and reducing the number of times people come into close contact with one other. In other words, people need to refrain from swapping air with each other.

The cultural context for twenty-first-century urbanity began when societies first remodeled nature to suit human purposes. All urbanized living is premised on intensified agriculture, technological innovations, and the development of state power culminating in the construction of cities (Fernandez-Armesto 2006). Living check by jowl for the last 11,000 years creates the "perfect storm" or environment for the spread of communicable infectious disease. Cities are perpetual motion mechanisms with flows of strangers sharing the same public spaces, sitting close to each other in subways, for example (Chan 2018).

Pandemics, for their part, have, historically, been traumatic, culture warping, civilization bending, and jarring events with the potential loss of life so great that entire societies disappeared. However, these events have not been the norm over the broader sequence of human history, they have been definitive episodes. Normally pathogen sharing is not problematic because the human species has antibodies which repel dangerous infections. But there have been an increasing number of times, when the species that becomes the new host is without any antigens and therefore unable to fend off an attack. Such is the case with COVID-19. This should not be a surprise because since 1980, the number of cross-species episodes has increased. Why? It is important to note that scientists point to the vast expansion in urban capacity made possible by erasing forests and reshaping the landscape for the agricultural development that feeds the metropolis. The earth is also reshaped by war when people forced to flee for their lives move into previously uninhabited regions disturbing, if not wrecking, the animal life. Laying down concrete, destroying the biodiversity with more humans residing with and among more animals that were previously distant creates diffuse pathways for the spread of pathogens.

However, in a distracted world full of getting and spending, most forgot, if they ever knew, that pestilence has been a relatively marked recurrence throughout human history. Camus in *The Plague* spoke to the shock of the fact that "somehow we find it hard to believe in ones that crash down on our heads from the blue sky" (Camus 1947). In the first quarter of the twenty-first century, we find that contemporary urban environments are premised on a business model designed to foster high rates of exchange by facilitating human propinquity or intense forms of human proximity (Chan 2018) are embedded in a hyper globalized world with pervasive human expansion increasingly intruding upon animal habitats. Sometimes animals wrested from the diminishing wilds are slaughtered in open air, densely populated urban

wet markets. Hence, the perfect petri dish for the transmission of animal pathogens to humans who then share it with other humans. Although pathogen transfers between and among species occur often, when the pathogen turns out to be a virus so perniciously novel and unfamiliar that human antibodies can't mount an internal defense and modern science cannot immediately facilitate an effective eradication program, the virus thrives as it infiltrates the closely designed urban environments and travels well-trodden globalized pathways in its search of human organs, of which there are plenty, to colonize and devastate. Add to this the fact that epidemiology holds that the growth rate for this particular disease is exponential. The number of new cases doubles every three to four days.

## Origination

The precise origination of SARS-CoV2, abbreviated to COVID-19, remains, as of this writing, unknown. What we do know is that a pathogen jumped from one species to another in 2019. This is not new. Pathogen leaping between species, in this instance from animal to human, can be traced back to the ancient world by scholars who apply medical, evidence-based models, to their studies argue that over the span of human history, infectious animal emanating or zoonotic transference events have been more lethal than wars. They point out that over time virulently transmissible diseases have precipitated most of the major social upheavals decimating all forms of human settlement. The infectious diseases ranked most contagious of all are smallpox and the plague. Other highly dangerous diseases are influenza, measles, polio, tuberculosis, dysentery, malaria, typhoid, and leprosy.

COVID-19, previously known as the novel corona virus or 2019-nCoV, emerged in Wuhan in December 2019, proliferated into Hubei province, and quickly spread to all provinces in China and then appeared, by the end of January 2020, in more than 20 countries across the planet. The primary means of transmission are respiratory droplets emitted when breathing and accelerated when speaking, eating, and singing. The coronavirus, seeking a live organ to parasitize, seeps into the nasal and throat passages before lodging in the lungs where it completely takes over the breathing mechanisms and other organs eventually killing the host.

## Mitigation

In a world bereft, as of this writing, of vaccines or antivirals to combat the spread of COVID-19, survival has depended on the implementation of classical public health measures. The goal is the prevention of person-to-person spread of the disease. The available tools are a spectrum of measures starting with isolation and quarantine, social distancing, and community containment. Each of these methods has been deployed at some point somewhere on the planet since 2019 advent of COVID-19.

Isolation or the separation of the contagious ill from the noninfected is standard in clinical settings such as hospitals. Sometimes, as with COVID-19 and in optimum care facilities, discrete rooms may be equipped with negative pressure mechanisms that reduce transmission via aerosols. But since COVID-19 may be transferred or shed long before a person realizes that they are infected, isolation is often too late to effectively prevent others from falling ill.

Quaranta means 40 in Italian. Fourteenth-century ships coming into Venice from plague-infected ports would anchor off site for 40 days before any passengers and crew would be allowed to disembark. In this time period, the full cycle of incubation was exhausted and those who were asymptomatic would become symptomatic. Quarantines have been particularly effective because such measures restrict any who are presumed to have been exposed but may not immediately show any symptoms. Historically, quarantines have been either mandatory or voluntary. When they include entire groups of people designated as "other," there has been widespread evidence of subjective castigation on the parts of those in power and in communities not subject to quarantine. The most effective quarantines occur when detection is prompt, contacts are listed and

traced within a short time frame to envelope the spread of the disease, and there are mechanisms to foster compliance.

Social or physical distancing is the voluntary reduction of interactions between people residing in a community. The theory is that some infected or asymptomatic individuals are in the community mix and could expose others unless everyone maintains a specified distance from one another. Since COVID-19 depends on the transmission of respiratory droplets and because they can only occur with people who are relatively close to one another, social distancing, in theory, reduces the rate of transmission. When transmission occurs in the community at large and there is not an effective way to detect the transmitters or even determine who has been exposed, social distancing is useful. In addition to public social spacing between people, social distancing also incorporates closing schools, shuttering businesses, cancelling public events, and suspending public gatherings. Such lockdowns restrict all human activity to shelters such as homes and apartments.

On the social distancing continuum, the widest application is community-wide containment or quarantine where personal interactions are significantly reduced with parameters encompassing entire cities, provinces, and regions. Usually, the only interactions permitted are those limited to securing vital supplies. Enforcement of such measures requires organized state, usually military, intervention, especially if the population is not widely compliant.

Even though most public health authorities have policing powers, such measures are often challenged as individual human rights weigh against the public health imperative. An effective community-wide containment may utilize local or state level law enforcement agencies. The implementation becomes a military exercise as physical roadblocks and checkpoints are established to monitor the parameters of the containment and halt any back-and-forth traffic. In the era of COVID-19, social media has made it easier for those not agreeing with the measures to broadcast their dissent and objections. However, public health officials can use social media to conduct broad based public education explaining why people need to adhere to the new regulations, avoid panic, and combat the proliferation of false narratives.

## The Theoretical Basis for Social Distancing

Epidemics are the rapid spread of disease to many people within a community, population, or region. Pandemics are epidemics that spread over multiple countries or continents. On March 11, 2020, the World Health Organization declared that COVID-19 was a pandemic. Recent studies revealed that the number of new cases doubles every three to four days. The world's scientists advised rapid lockdown to prevent the pandemic from spiraling out of control. This was an effort to save lives and, as was quickly picked up by governmental leaders, to "flatten the curve." The implication was that saving lives meant spreading the use of valuable resources such as ICU units, adequate protective gear, number of hospital beds, and the life energies of medical personnel, etc., out over time so that they could be replenished in due course. The alternative was a surge in the rate of illnesses that with resources exhausted and entire populations wiped out or dead and dying.

At that point, the SARS-CoV-2 virus was, in its current incarnation and relatively speaking, three months old. Fearful of the impact of a newly identified virus on the health care systems around the world, countries were trying to arrest the deadly spread by declaring national following emergencies. Coronaviruses have circulated in humans for centuries causing mild respiratory infections some of which are accompanied by gastrointestinal disturbances. SARS-CoV-2, however, belongs to the newer strands classified as "true emerging infectious diseases" which have undergone recent animal-to-human transitions (ConsultQD 2020).

Epidemiology is the study of the distribution and determinants of disease and other health states in human populations by means of group comparisons for the purpose of improving population health. From the perspective of epidemiology, social distancing is imposed to reduce,

significantly, the rate of illness. In the face of a highly communicable and unknown virus that, without mitigation, threatens to reduce populations to extinction, modern public health entities such as the U.N. World Health Organization and the U.S. Centers for Disease Control developed mitigation strategies that would significantly reduce the impact by closing societies down and asking people to exercise abundant caution by sheltering at home. However, essential workers, that is, all medical personnel plus those who worked in grocery stores and gas stations or drove buses and engineered subways, were to continue working so that society would still provide medical care, food, and some form of transportation. Social masking was enforced along with public social distancing. Clear sheets of plastic were installed between clerks and customers to prevent one from breathing on the other. Markers were placed on floors in large grocery stores at checkout counters helping people remain at least six feet from one another. Food processing plants introduced protective gear, plastic shields between workers and regular sanitizing. The state of New York, under the leadership of Governor Andrew Cuomo, deep cleaned and sanitized the vast subway and train system for the first time since its inauguration in 1904. To facilitate the wearing of masks which slow down the spread by capturing personal air droplets, public facilities such as train stations and schools are making surgical paper masks freely available.

Epidemiologists worked with policy makers to develop the goals of these mitigation efforts to initially "flatten the curve" and later save lives by preventing infections. Nine months into the pandemic, there are vast surges of illness and public health systems on the brink of total collapse. All efforts aside, morbidity has not been minimized and the associated mortality has not been lessened. The world hopes for the development, manufacture, and distribution of a vaccine.

To measure the effectiveness of social distancing, epidemiologists look for the effective reproduction numbers or possible number of reduced cases as a consequence of social distancing. The goal is to achieve a relative rate of 1.0. A risk of 1.0 means that the incidence of disease is very flat and nonthreatening. When the relative risk reaches 2.0, there is a 50% likelihood that the community is threatened with infection and the spread of the disease is actually or potentially becoming rampant in the community calling for the imposition of public health measures.

## The Use and Abuse of Social Distancing Over Time

It was the Chinese who first observed that whenever armies march pestilence follows. The world experienced that in the period of colonization when passing diseases and deliberately infecting people was governing policy carried out by military commanders such as Colonel Amherst and others in the Americas who intentionally passed infected blankets to indigenous peoples.

During the Song Dynasty, 293 infectious plagues were recorded ranging from typhoid fever and typhus to smallpox, leprosy, measles, tuberculosis, and many more. It was in the period that the Chinese developed vaccination procedures in the tenth century and practiced social distancing by attaching lateral bars to headgear that served to notify others to keep their distance.

In the west, contracting leprosy or Hansen's Disease, an infection which is very hard to contract and today treatable with multidrug therapy, was, going back to the ancient world, feared and despite evidence to the contrary, regarded as highly infectious. Known as "lepers," suffers were shunned, forced into segregated isolation, often in geographically remote colonies, and thought of as suffering from a spiritual corruption that led to moral and corporal decline. The mark of the leper forced people "into the shadows of society." Such attitudes had profound social consequences as suffers were forced to forfeit their "individual liberty" and live with "disturbed relations between the individual and society" an "altered bond between family members, distanced" from "social benefits and challenged laws and social codes" (Levison 2003).

The inability to visit loved ones who languish in hospitals or nursing homes from the virus is a great social stressor in the twenty-first-century era

of COVID-19. In the fourteenth century, when the bubonic plague ravaged Scotland, one writer noted that "It generated such horror that children did not dare to visit their dying parents, nor parents their children, but fled for fear of contagion as if from leprosy or a serpent" (Bichell 2014).

## The Psychic Cost of Social Distancing

The public health imperative to impose a virtual lockdown or quarantine on the planet in order to save the human species from near extinction remains compelling. However, psychologists point out that staying away from one another, avoiding large gatherings and close contact with others entails risks of its own. Have we been called upon "to suppress our profoundly human and evolutionary hard-wired impulses for connection: seeing our friends, getting together in groups, or touching each other"? What about our capacity for cooperation? What is asked of us is not just to protect the people that we know, "but also people we do not know."

Studies show that extensive social isolation increases risks for heart disease, depression, dementia, and even death. "Chronic social isolation increases the risk of mortality by 29%." Theoretically, actual social contacts and perceived social contacts mitigate the negative effects of stress. Enforced social isolation stands to deepen the stress of those who were isolated and lonely prior to the advent of the pandemic. Older people and people with co-morbidities who are also more immediately susceptible to COVID-19, many suffer under conditions of social isolation because they may have already lost family and friends along with any chronic illnesses that may be present and any sensory impairments such as hearing loss. These factors are just some of the ways that make it harder to interact. However, people are resilient. We know from studies of Vietnam Prisoners of War who were confined for years to tiny cells known as "tiger cages" who believed that no matter how bad things were, they would eventually be released, enjoyed better mental health later in life (Miller 2020).

## Summation

Although humans have had long exposure to plagues, we have advantages in the twenty-first century that did not exist in previous eras. For example, knowledge of the threat is communicated instantly to everyone on the planet, providing time to put social distancing measures in place. This saves lives. Digital communications platforms relieve some of the hardship by reinforcing social connections that may become frayed and even dissolve in the face of social distancing. But the most beneficial advantage is the ability to develop a vaccine. "Vaccination allows us to maintain rich, interactive social lives despite contagious diseases such as polio and measles that would over wise ravage us" (Hawley and Buck 2020).

Until the day when we can once again experience our love of mingling with fellow humans, we need to maintain strategic social distancing practices. And we need to work to maintain the most essential social interactions as we distance farthest from those who are most vulnerable and who could infect us by accident. The short-term cost of social distancing becomes a long-term payoff if we survive the pandemic.

# Social Economy, Social Accounting, and NP Organizations

Gianluca Antonucci
DEA – "G. d'Annunzio" University of Chieti-Pescara, Chieti-Pescara, Italy

## Synonyms

Corporate social responsibility; Social reporting; Third system

## Definition

Social economy represents an area consisting of cooperatives, mutuals, associations, and foundations engaged in the production of goods and services, with no purpose of the owners' enrichment, but instead having objectives of sharing and solidarity, being engaged in activities such as local development, re-employment, and the fight against social exclusion.

Social accounting represents a set of organizational activities that deals with the measurement and analysis of an organization's social performance and the voluntary disclosure of results to concerned groups, both within and outside the organization.

The link between social economy and social accounting is given by the fact that Social economy organizations, in many cases, are hardly operationally distinguishable from for-profit business ones. Thus social accounting principles represent a convincing and valid possibility to correctly account that a social economy organization is operationally working for achieving its mission, which is different from businesses' one and cannot be proved by financial reporting schemes.

## Introduction

Having French origins datable to the first decades of the nineteenth century, the social economy (SE) concept is historically linked to popular associations and cooperatives. Nowadays SE can be seen as a set encompassing cooperatives, mutual societies, and associations as well as foundations. The basic line for this composition is given by the fact that all these organizations, although different in their legal form, have the aim to give answer, through self-help organizations to vulnerable, defenseless, and socially excluded citizens.

In the second half of the twentieth century, SE has been reviewed as an area constituted by organizations like associations, mutual, cooperatives, and foundations engaged in the production of goods and services, with no purpose of the owners' enrichment, but instead having objectives of sharing and solidarity, being

engaged in activities such as local development, re-employment, and the fight against social exclusion.

Social accounting (SA) provides a set of tools and procedures aiming at measuring and analyzing, as well as giving information to all stakeholders, the social performance of organizations. Thus it is based on a voluntary disclosure by an organization which decides to give information about product and consumer interests, employee interests, community activities, and environmental impacts, having different reporting schemes which underline different aspects far from the "simple" financial reporting concerning profits.

The link between the two concepts is given by the fact that, whatever the legal nature, an organization encompassed within the principles of SE has, as inspiring mission, a social objective rather than the search for profits, because it prioritizes its social objectives which are designed to serve social needs. In this respect, for SE organizations, the disclosure of the achievement of social objectives is part of their reason of existence because SE framework is linked to the way in which an organization acts according to its mission. That is why these organizations, in a sense, need SA principles and use social reporting schemes in order to mark their difference and specificities, demonstrating, toward all the different shareholders and stakeholders, that they are achieving their mission.

This chapter is sectioned in three parts. The first one describes the concept of SE since its origins. The second one does the same thing for the concept of SA since its origins in the 1970s. The third section underlines the strict link between the two concepts showing as organizations encompassed within the SE framework need SA principles in order to account the achieving of their mission.

## Social Economy

The origins of the locution social economy (SE) can be traced in the French term *Économie Social* as defined by the French liberal economist Dunoyer, who published in 1830 two volumes, entitled *Nouveau traité d'économie sociale* (New dissertation of social economy). According to the Director of the Center of Social Economy (Centre d'économie sociale du Conservatoire des Arts et métiers – Ceste-Cnam) (Draperi 2008), the acceptation of the term *Économie Social* as the one regarding different ways of operating in mutual and social assistance can be dated back to the second half of the nineteenth century, and it is attributable to the French business manager Godin. Indeed France is the place where SE was born as a manifestation of popular associative movements. Indeed, "the emergence of cooperatives and mutual societies during the first half of the 19th century cannot be explained without considering the central role of popular associationism, which in its industrial associationism version found its driving force" (Monzón Campos and Chaves Ávila 2012, p. 15).

The system of values and the principles of conduct of the popular associations "still informs the modern concept of the SE, as structured around three sets of organisations: cooperatives, mutual societies and associations, foundations (. . .). All these organisations were, and still are, interlinked by a single impulse: the response of the most vulnerable and defenseless social groups, through self-help organizations" (Monzón Campos and Chaves Ávila 2012, p. 13).

Given its French origin, the SE model grew mostly in French-speaking countries, but also in many Western European countries, during the end of the nineteenth and beginning of the twentieth centuries. In the following decades, the growth model in Western Europe mainly featured the traditional private market sector and the public sector, developing the different models based on the welfare state concepts, which, recognizing the existence of market failures, adopted policies aiming at correcting them such as income redistribution, resource allocation, and anti-cyclical policies. The adoption of these policies did not exclude the growth of cooperatives, mutual societies, and associations constituted, by private entities, in order to address socially important and general interest issues. The growth of welfare state concepts led SE principles to practically disappear being the state (public sector) the main actor in addressing social issues. In the last decades of the twentieth century, the crisis of the

welfare state and the mixed economy systems led in some European countries to pay "new" attention toward SE's organizations which were seen as valid actors to overcome both market failures and welfare state crisis. Indeed these organizations were found able to plan strategies and implement different and valid ways of actions to tackle issues which were not adequately addressed by both market agents and public sector ones such as long-term unemployment, social exclusion, health, poor education, and so on, being able to promote a sustainable growth.

Once again France was the cornerstone of this new impulse toward the concept of SE, with the modification, in 1980, of the French Act on Non-Profit Institutions and then, in 2004, with the creation of the Regional Chamber of Commerce for Social Economy (*Chambre Régionale de l'Économie Sociale et Solidaire*). This new input started in France and led to a reframing of the concept, also at an academic level, in other European countries and Canada.

The redefinition of SE describes it as an area consisting of cooperatives, mutuals, associations, and foundations engaged in the production of goods and services, with no purpose of the owners' enrichment, but instead having objectives of sharing and solidarity, being engaged in activities such as local development, re-employment, and the fight against social exclusion. The definition SE indicates the various private entities that are part of it, underlining their own codes of conduct and their governance, which are far from the business sector ones (Baulard 2008).

According to the "new" conceptualization, the different organizations belonging to SE respect four basic principles:

- Freedom of accession.
- Nonprofit-making: surpluses are not redistributed as remuneration of the capital.
- Democratic governance, based on the principle: "one person, one vote."
- Independence from public authorities (Baulard 2008).

Despite the diffusion in other European countries, the redefinition of SE would have remained a niche of French-speaking countries if it had not been for the fact that, since the end of the 1980s, it has been, thanks to the French inputs, the basic definition within the European Union (EU) for classifying the organizations that occupy the space between the market and the state. The EU arrived in 2000 at the creation, within the European Commission, of the Permanent European Conference of Cooperatives, Mutuals, Associations, and Foundations (*Conférence Européenne Permanente des Coopératives, Mutualités, Associations et Fondations* – CEP-CMAF), thus making the concept of SE the first attempt, at the international level, of framing, within a specific sector, all the different realities working in the space between the state and the market.

According to the most recent conceptual definition – within the Charter of Principles of the Social Economy promoted by CEP-CMAF (2002) – the principles regarding the organizations encompassed within the framework of SE are:

- The primacy of the individual and the social objective over capital
- Voluntary and open membership
- Democratic control by membership (does not concern foundations as they have no members)
- Combination of the interests of members/users and/or the general interest
- Defense and application of the principle of solidarity and responsibility
- Autonomous management and independence from public authorities
- Use of most of the surpluses to pursue sustainable development objectives, services of interest to members, or the general interest.

## Social Accounting

Since the mid-1970s, private enterprises have been increasingly providing a high level of motivation in ensuring that their aggregate impact upon society was consistent with social goals and aspirations. Indeed some aspects, such as economic depression and consequent

unemployment, the growth of social disparities among different social groups, and last but not the least, the serious threat to environment equilibrium caused by many industrial activities, led, along the time, both practitioners and academics (and later some politicians) to think that the profit was not anymore an exclusive variable to measure corporate performance. At that time "a comprehensive analysis of the social impact of private enterprise suffered (. . .) from a general absence of reliable data on aggregate social costs and benefits of business and on how these were shared among various social groups" (Ramanathan 1976, 516). Although disclosure practices, at that time, varied considerably as regard to scope, format, use of quantitative and financial measures, and the significance of items disclosed, the trend was clearly going toward greater disclosure, by private firms, with an increasing concern with their social responsibility and their attempts to institute some forms of social audit. Thus the challenges involved in accounting for corporate social performance started to engage a particular attention by major accounting institutions because the solutions to many social problems required the active and willing involvement of private business organizations, and consequently, the extent that measured corporate profits was not anymore adequate. A broader scheme of corporate performance measurement was then necessary (Ramanathan 1976).

Along the years, many steps have been made toward the solution of the problem of finding a broader scheme of corporate performance measurement able to include social issues. Nowadays SA is widely recognized and "can be defined as a set of organizational activities that deals with the measurement and analysis of the social performance of organizations and the reporting of results to concerned groups, both within and outside the organization (. . .). Social accounting is an inclusive field of accounting for social and environmental events which arise as a result of, and are intimately tied to the economic actions of organizations" (Islam 2015, p. 11).

But if the aim of SA is clear, there is not yet any unique shared technique as the ones regarding the principles concerning financial performance accounting. SA schemes ought to be a right combination of nonfinancial and descriptive information which are not easily quantifiable, and farther SA is not a wholly coherent area, and definitions applicable to this area, as underlined by Islam (2015), are many and varied because different definitions were developed in the last years, all sharing the same aim but without finding common tools. The main definitions, as summarized by Islam, are the following:

- Social accounting is the process of selecting firm-level social variables, measures, and measurement procedures, systematically developing information useful for evaluating the firm's social performance, and communicating such information to concerned social groups, both within and outside the firm.
- Social accounting is the process of communicating the social and environmental effects of organizations' economic actions to particular interest groups within society and to society at large. As such, it involves extending the accountability of organizations (particularly corporations) beyond the traditional role of providing a financial account of capital, in particular, to shareholders. Such an extension is predicated upon the assumption that companies do have wider responsibilities beyond simply making money for their shareholders.
- At the very least, social accounting means an extension of disclosure into nontraditional areas such as providing information about employees, products, community services, and the prevention and reduction of pollution. However, the term social accounting is also used to describe a comprehensive form of accounting which takes into account externalities.
- Social accounting is that aspect of accountancy which, while indistinguishable from financial and management accounting, deals more specifically with environmental concerns; that is, it is an aspect of the information system that enables data collection and analysis, performance follow-up, decision-making, and accountability for the management of environmental costs and risks (Islam 2015, p. 12).

As a logical consequence of the coexistence of different definitions, each one underlining a specific aspect of SA, and the absence of a unique shared reporting technique, social reporting still remains an issue concerning voluntary (never mandatory) disclosure by firms about different aspects such as product and consumer interests, employee interests, community activities, and environmental impacts, having different reporting schemes which underline different aspects according to the aim of the voluntary disclosure decided by each organization.

Social reporting can be indeed considered within the issues regarding corporate social responsibility (CSR) whose definition, at something comparable to a mandatory level, can be found in the one given by the European Commission (2001) which describes CSR as a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis. Thus, according to the EU Commission, being socially responsible means not only fulfilling legal expectations but also going beyond compliance and investing more into human capital, the environment, and the relations with stakeholders.

CSR reporting can include social reporting and/or environmental reporting, and the two can be considered as components of sustainability reporting which can be considered as an addendum to the financial reporting concerning economic performance (Deegan 2014).

Social reporting provides information about aspects such as fair labor practices (workers' health and safety, training, and education), respect of human rights (non-discrimination, freedom of association, no exploitation of child labor, respect of indigenous cultural traditions), and product responsibility performance (customer health and safety) (Deegan 2014).

Environmental reporting should include communications about the respect of the environment avoiding pollution derived by machinery and productivity processes, giving information about, for instance, materials usage, energy usage, water consumption, emission effluents, and waste (Deegan 2014).

Sustainability reporting adds, to both social and environmental reporting, the ones regarding the economic performance of the organization. In some sense it is the voluntary disclosure of the possibility of having good economic performances paying anyway greater attention to social and environmental issues.

The growth of CSR practices led, in the last decades, to an increase in the use, by more and more organizations, of SA practices having, as consequence, both an increase in SA research and a growth of national and international institutional groups (including governments, industry bodies, accounting professions, and international bodies). Indeed, social reporting still remains a voluntary disclosure, but the increase of the demand about social reporting, as well as the aim of clearly defining all different aspects related with reporting schemes about organizational transparency, responsiveness, ethics, and sustainability, to name a few, led, in the last decades, to an important development of nonfinancial reporting schemes both in North America and in Europe. All these schemes have in common the concepts regarding CSR, also if declined in different ways according to different certifying subjects. Also if CSR and consequent social reporting is not mandatory but part of the voluntary disclosure of an organization, an important issue is represented by the fact that, in order to be socially accountable, in a reliable way, toward the different stakeholders, many organizations started to find a way to be in some sense certified (i.e., verified, attested, and declared) by a third independent part. Thus, since the beginning of the 1990s, there has been the birth of certifying subjects as:

- AccountAbility 1000 (AA1000) (www.accountability.org) initially elaborated by the International Council of the Institute of Social and Ethical Accountability in London, UK
- SA 8000 (www.sa-intl.org/) elaborated by the Social Accountability International (SAI) in New York, USA
- Sustainability Reporting Guidelines elaborated by the Global Reporting Initiative (GRI) in Amsterdam, Netherlands (www.globalreporting.org)

– CSR Europe (www.csreurope.org) in Brussels, Belgium, an European business network for corporate social responsibility of around 45 corporate members and 41 national CSR organizations

All the above reported organizations are third parties (i.e., involved neither with the organization nor with its stakeholders) that provide guidelines and, in several cases, certify that the organization, whether public or private, or for profit or not for profit, follows the principles and rules defined by them. That means that if the organization is certified by one of the above reported organizations, it is "socially responsible," and the certifying organization guarantees that it has specific core aspects related with CSR and their reporting schemes' voluntary disclosure of their actions within the principles of SA.

The point is that the concept of being accountable about social aspects is becoming nowadays such a great issue that each of the above reported certifying bodies is in some sense specialized upon a specific topic. For instance, AA 1000 seeks more about stakeholder engagement, SA 8000 seeks more about working conditions, GRI seeks more about environment and pollution aspects, and CSR seeks more about nonfinancial reporting schemes.

## Role of Social Accounting Within Social Economy Framework

The first two sections of the text illustrated the concepts of SE and SA. The first one has been described as an area consisting of cooperatives, mutuals, associations, and foundations engaged in the production of goods and services, with no purpose of the owners' enrichment, but instead having objectives of sharing and solidarity, being engaged in activities such as local development, re-employment, and the fight against social exclusion. It has been underlined that SE emphasizes the codes of conduct and governance of the different organizations that can be recognized within this framework, which are far from the business sector ones.

SA has been described as a set of organizational activities that deals with the measurement and analysis of the social performance of organizations and the reporting of results to concerned groups, both within and outside the organization.

The link between the two concepts is given by the fact that, whatever the legal nature, an organization encompassed within the principles of SE has, as an inspiring mission, a social objective rather than the search for profits, because organizations in the SE prioritize their social objectives which are designed to serve social needs unmet by either public or private sectors. These social objectives are often asserted within the mission statement written into the organization's charter; therefore, "the social objectives are not a secondary consideration, as when a conventional business decides to embrace CSR while in pursuit of profit, but are central to the organization's purpose from its inception" (Mook et al. 2015, p. 8). That is why, also if SA still remains voluntary and not mandatory, for SE organizations the disclosure of the achievement of social objectives is part of their reason of existence.

In synthesis SE framework is more linked to the way in which an organization acts, and to its mission rather than on its legal form, this means that SE framework encompasses a larger ensemble of organizations than the "simple" nonprofit definition because in its broad formulations, the concept of SE encompasses not only voluntary, charitable, and nonprofit organizations but also more entrepreneurial ones such as cooperatives and mutuals as well as social enterprises. These latter organizations produce for the market being anyway clearly socially oriented. "SE concept as widely used thus blurs the line between market-based, for-profit entities and the nonprofit, or nonprofit-distributing entities" (Salamon and Sokolowski 2016, p. 1526).

Indeed cooperatives and mutual, since the first definition of the nineteenth century, form the heart of SE conception, but some types of cooperatives and mutuals "have grown to the point where they are hard to distinguish operationally from for-profit businesses, particularly if some type of limitation on the distribution of profit is taken as a proxy for the pursuit of public purpose" (Salamon

and Sokolowski 2016, p. 1529). A similar argument can also be made to new realities like social enterprises (in France and Italy), community interest companies in the UK, and benefit corporations in the USA, also if not completely in this last case because benefit corporations have a greater possibility on profit distribution than the other ones.

All these organizations, clearly encompassed within the principles of SE, are hardly operationally distinguishable from for-profit business ones. In this case SA principles and social reporting schemes really represent a convincing and valid possibility to correctly account that the organization is operationally working for achieving its mission, a mission that has social objectives, often even written into the organization's charter, which is different from a for-profit business organization. That is why – differently from for-profit business organizations that voluntarily decide to embrace CSR principles using also social reporting schemes – organizations encompassed within the SE schemes *need* SA principles and use social reporting schemes in order to mark their difference and specificities, demonstrating, toward all the different shareholders and stakeholders, that they are achieving their mission.

## Conclusion

This chapter has illustrated the concepts of social economy and social accounting, underlining why the latter represents a fundamental one for a clear framing and illustration of the specificities that characterize all different NP organizations encompassed within SE principles, especially the more entrepreneurial ones such as social cooperatives and social enterprises mainly widespread in Europe.

Also if SE still represents mainly a European definition, tracing its origin in France and its renewal within the European Union, its conception – as an area consisting of different NP organizations (from associations to social enterprises) having objectives of sharing and solidarity – constitutes anyway an important reference point. In fact it marks the difference between NP organizations and market ones. On the other hand, on a practical level, it is important that each SE organization demonstrates its peculiarities. That is why SA principles become a valid tool.

SA has been, in fact, described as a set of organizational activities that deals with the measurement and analysis of the social performance of organizations and the reporting of results to concerned groups, both within and outside the organization. Therefore SA principles and social reporting schemes really represent a convincing and valid tool to correctly account that an SE organization is operationally working for achieving its social objectives, often even written into the organization's charter.

# Social Entrepreneurial Venture Creation in Uganda

Isa Nsereko
Department of Entrepreneurship, Makerere University Business School, Makerere University, Kampala, Uganda

## Synonyms

Community-led social ventures; Social startup; Social venture creation; Social venturing creation

## Definition

Social entrepreneurial venture creation is the process where individuals initiate social innovative business models with an aim of creating social impact and financial benefits to the people at the bottom of the pyramid.

## Introduction

Social entrepreneurship has emerged as a great field and a good deal of talk that creates a potentially transformative societal change. This change is realized through the notion to address the unmet social, economic, and environmental needs within the community. Due to the continuous realization of social challenges in developing nations like extreme poverty, high crime rates, prostitution, hunger, human right abuse, poor sanitation, poor education, unemployment, violence, diseases, and drug abuse, there is an increased demand for social venture creation to help the underserved.

Social ventures are important because they transform people at the bottom of the pyramid through permanently providing innovative solutions to solve underserved communities. They further create employment opportunities to the marginalized segments that could never change their lives (Kyazze et al. 2020). They also provide basic essentials like clean water, access to better health and education services, and reduction of crime abuse. These social entrepreneurs create and implement actual, innovative, and sustainable solutions to battle social and environmental challenges.

Social ventures purposely pursue economic, social, and environmental aims but with more emphasis on creating a public good, social mission, and having financial sustainability. The creation of social ventures goes through a process that is enforced by the social entrepreneurs themselves, the stakeholders, and the general environment where operations occur. These social ventures revitalize their communities through empowering the community, having meetings, and creating networks. This has come in because of the response to changes in government policy and expenditure priorities where government budgets cannot fully support the citizens, therefore calling for social venture creation that can help the less privileged. Further, community-led social ventures offer a potential response to market failures where the government provision and the private sector cannot fully provide for the people.

Looking at the fruits of social ventures, the government of Uganda and the development partners initiated programs to help the disadvantaged groups in society. The government of Uganda through its programs like Prosperity For All, Youth Fund, and Operation Wealth Creation has not fully achieved its aim because of the limited budgets and corruption. The inability of government to solve the tenacious community problems has given rise to a unique category of people, and those are the social entrepreneurs who create world impact.

These individuals have unique behavioral characteristics that facilitate social entrepreneurial

venture creation such as personal initiative, self-starting behavior, proactiveness, proclivity, innovativeness, risk-taking, passion, trust, empathy, and hardworking. These social entrepreneurial traits are important in attaining a first-mover advantage, and the process of starting a social enterprise goes through a process.

Social venture creation begins by having pre-venture activities. These are carried out before starting the venture. Such actions and functions enhance the process of social entrepreneurial venture creation by starting with self-awareness, social opportunity identification, opportunity evaluation, opportunity exploitation, and finally expansion of the social venture. The next phase is gathering resources followed by exploiting the social business idea that has been selected. After the business has been established, a social entrepreneur may now think about the post startup like inception/existence, survival, growth, expansion, and maturity. More still, during maturity, actions like new venture creation, expansion, professionalization, consolidation, and continued development are considered. Lastly, a social entrepreneur can look at post maturity as having diversification, integration, decline, and revitalization. The process of social entrepreneurial venture creation continues but not without challenges.

Social ventures operate in ambiguous environments that have different stakeholders who have divergent views and different levels of conceptualization of social problems. Sometimes they fail to agree on how to solve social challenges, and this affects the way they operate. According to Gartner (1985), a conceptual framework depicting the phenomenon of new social venture creation has four dimensions, namely, individual, organization, environment, and process. An individual is backed up by traits like prior knowledge, experience, and skills that are prerequisites in creation of ventures. The organization dimension focuses on how a social enterprise functions by looking at social and economic benefits. The environment dimension indicates that all actions a social entrepreneur does in social venture establishment is shaped by both informal and formal environmental factors. Process as a dimension looks at the initiation stage from opportunity recognition and inception to the actual establishment of a social startup and then moving to growth and sustainability.

Social ventures continuously face environmental pressures through heightened competition for resources like people, grants, donations, and public funds. This enhances adoption of different entrepreneurial and social innovations that can create social impact and sustainable business survival. As social entrepreneurs fight for their survival, they end up creating social entrepreneurial ventures that solve social problems for the underserved communities.

## Emergency of Great Social Heroes

Great minds have broadened the concept of social business creation. In the 1970s, Muhammad Yunus instigated Grameen Bank, in which he introduced the social business model that was aimed at helping the poor, underserved, and homeless women in Bangladeshi to access loans at low interest. This later created the concept of microfinance, a model that has been accepted and adapted in many developed and developing economies. In Egypt, the Sekem project was founded by Ibrahim Abouleish, and it has helped the poor agricultural farmers to have a living.

## Evolution of Social Entrepreneurship in Uganda

Social enterprises in Uganda date as far back as the pre-colonial period. People would get together in associations like "MunnoMukabi" to solve their own challenges like road construction, giving loans, communal farming, and marketing produce. The emergency of colonialism changed the way community groups interacted. Such organizations started to resist colonial rule by demanding for higher agricultural produce prices. The resistance gave birth to cooperative societies which were created by the colonial government to support and encourage agricultural production. Such cooperative associations included "Young

Men of Buganda" and the "Uganda African Welfare Associations."

In 1888–1962 when Ugandan was given independence, NGOs like Uganda Council of Women focused on human rights by letting women engage in active politics. Young Women's Christian Association (YWCA) and Young Men's Christian Association (YMCA) were religious based and created by the missionaries who provided charity to the less privileged by building schools, hospitals, and churches. International NGOs like the International Committee of the Red Cross (1962), Oxfam (1963), and CARE (1969) were then created, and since then, the numbers of NGOs in Uganda have been growing steadily.

In the 1990s, the social ventures that were interested in capturing social problems from the grass root changed to professional organizations that focused on impactful social business models. The models that can look at helping a wider disadvantaged group of people to get employment have access to good education, sanitation, water, and health as well as providing profits from such a venture.

## Theoretical Underpinnings

To better understand the compendium of the complexity of social venture creation which has the desire to improve the social well-being and the business scenery, a number of theories have been used to explain social entrepreneurial venture creation including theory of opportunity identification and development, personal initiative theory, action regulation theory, conservation of resources theory, social capital theory, effectuation theory, and social network theory.

The theory of entrepreneurial opportunity identification and development assumes that opportunities are identified by knowledgeable people who are always alert to opportunities.

It emphasizes that people with prior knowledge can easily start social ventures because they have a lot of information and can even practically carryout social venture activities that are aimed at solving social needs.

Action regulation theory (ART) stems from a social psychology paradigm which attempts to explain an individual's intention to perform a given behavior. The theory explains how people regulate their actions to achieve certain goals. It assumes that individual actions are driven by goal-directed behavior and that all actions that are carried out have a degree of intentionality to perform a task. The theory explains the fact that actions and decision to start a social entrepreneurial venture are predicted by behavioral mechanisms like intention and action plans. It is these behavioral aspects that enable the marginalized to solve challenges.

Theory of personal initiative (PI) postulates that people with certain personal traits are influenced by their environment and the behavior they possess. The theory explains personal initiative, self-starting behavior, and creativity as vital factors that can ease creation of social entrepreneurial ventures that are impactful.

Conservation of resources theory (COR) assumes that individuals strive to obtain, retain, protect, and foster things that they value. The things that they value are conditional resources such as status and social support which influence the behavior of individuals when creating social entrepreneurial venture.

## Dimensions of Social Entrepreneurial Venture Creation

Nsereko et al. (2018) and Nsereko (2020a, b) have attempted to conceptualize social entrepreneurial venture creation to include variables such as personal initiative, comprehensive social competence, action planning, conditional resources, entrepreneurial intent, and entrepreneurial tenacity. They have conceptualized social entrepreneurial venture creation as a concept that is still in its infancy (Kachlami 2016).

These researchers carried out a cross-sectional survey which was quantitative in nature. They developed questionnaires, collected survey data, and analyzed the data. Measurement items were subjected to explanatory factor analysis (EFA), and when it was deemed more suitable,

confirmatory factor analysis (CFA) was conducted for the retained items from CFA. The measurement models determined that personal initiative, comprehensive social competence, action planning, conditional resources, entrepreneurial intent, and entrepreneurial tenacity explain social entrepreneurial venture creation behavioral aspects.

However, even with the existing government interventions, challenges still exist, and more needs to be done in terms of training on the importance of social entrepreneurial venture creation in emerging economies.

## Conclusion

Scholarly literature about social entrepreneurial venture creation has focused on factors such as personal initiative, comprehensive social competency, entrepreneurial tenacity, and conditional resources to facilitate new social venture creation among the marginalized groups. The government needs to get involved in supporting action-oriented training for such variables to boost social venture creation.

Conclusively, self-assurance matters for social entrepreneurial venture creation outcomes since it boosts individual's prior knowledge and entrepreneurial alertness which are vital when establishing social entrepreneurial ventures. Confident individuals who are exposed to new market information, information on starting successful businesses, and market shifts have to believe in themselves, and this belief enables them to make tough decisions of creating social entrepreneurial ventures.

Social positions in the community are vital for social venture creation because these individuals are influential, recognized, and prominent and hold big positions in the community.

Conditional resources like social support are crucial in promoting social startups. Support in terms of donations, seed funds, information, business advice, technical support, and provision of trainings, among others, helps in taking quick decisions of designing a business plan and finally launching social entrepreneurial ventures.

Lastly, the centrality of behavioral mechanisms like taking personal initiative enhances self starting actions to create ventures. Social entrepreneurs who exhibit initiative are original in coming up with new social products or services. They have love for being champions of their ideas; they quickly identify business opportunities and mobilize funds to start social entrepreneurial ventures. They are also determined to adapt to any changes in the communities so as to create social impact.

# Social Entrepreneurship

Robert A. Stebbins
University of Calgary, Calgary, AB, Canada

## Synonyms

Commitment; Devotee work; Obligation; Social entrepreneur; Social problem; Volunteer

## Definition

Social entrepreneurship: Efforts to solve intractable social problems through pattern-breaking change in what governments, nonprofits, and businesses do to address significant social problems (Light 2008, p. 12).

Social entrepreneurs: Practitioners who engage in such activity. They are also volunteers, and at least initially, unpaid or minimally paid participants in the nonprofit sector.

## Introduction

If articles in the mass print media and on certain websites are any indication, social entrepreneurship has become something of a modern-day hit among morally conscious people eager to solve a particular social problem and, for some of them, possibly to make money in the process. Social entrepreneurship is substantially an altruistic undertaking. These entrepreneurs execute innovative solutions to what they define as social problems, be they local, national, or international. In social entrepreneurship, people use the principles of enterprise to foster social change, which they do by establishing and managing a venture. Some of them set up small, medium, or large nonprofit groups designed to ameliorate a difficult situation threatening certain people, flora, or fauna or a certain aspect of the environment, if not a combination of these. Others are profit seekers. They work to set up a money-making enterprise that also improves such a situation in one of these four areas.

Whether starting and running a nonprofit or a for-profit social enterprise, these entrepreneurs are in general practically oriented people. They have a mission, typically one that is powerfully felt, and they want action leading to solution of the problem targeted in that mission. But what, in scientific terms, are these people doing? How does one explain why some people devote huge amounts of time and sometimes personal funds to solving a social problem? It might be argued that in the case of the for-profit entrepreneurs the answer is obvious: they want to make money. Still, when profit is the motive, nearly all social enterprises are substantially risky ventures. If a person wants to be sure of making even a modest amount of money, there are far more secure businesses than this kind.

In other words, one must look beyond the profit motive for a more profound explanation of social entrepreneurship. The serious leisure perspective offers a two-pronged explanation that meets this requirement. The crux of the following argument is that pursuing nonprofit entrepreneurship is a serious leisure undertaking of the career volunteer kind, whereas pursuing a for-profit entrepreneurship is a kind of devotee work. What, in detail, does this mean?

## Conceptual Foundation

When people volunteer, they engage in a special kind of leisure. Leisure – it is no easier to define than social entrepreneurship – has nevertheless been defined as "un-coerced, contextually framed activity engaged in during free time, which people want to do and, using their abilities and resources, actually do in either a satisfying or a fulfilling way (or both)" (Stebbins 2012, p. 2). A *volunteer* is someone who offers altruistic help either formally or informally with no or, at most, token pay for the benefit of both the target of benefits (beneficiaries of the work of the enterprise who are not part of the volunteer's family) and the volunteer. A fuller definition of volunteer that is commensurate with this definition of leisure is available in the chapter entitled "Volunteer Motivations and Nonprofit Organizations."

The present chapter is devoted mainly to describing the nature of social entrepreneurship and showing the social entrepreneur's place within it. But first as background, what is the nature of the social problems that are the target of this person's efforts?

## The Nature of Social Problems

Consider a simple typology. Some problems are "ordinary," primarily because they are nuisances or pet peeves, like overcrowded roads, outrageous

dress, rude drivers, barking dogs, and telephone solicitors. Other problems threaten our way of life. People talk often these days of environmental pollution, property crime, business and governmental corruption, economic crises, and so on. And then there are the problems that threaten life itself, which include global climate change, war, famine, genocide, disease, and a variety of natural disasters. It is probably true that the modern world is plagued with more problems of all three types than at any other time in history. In fact it is very difficult to compare the nature and frequency of challenging problems across history, in part because factual data about the three types are woefully incomplete.

Thus, the world's "to do" list problems to be solved are enormous, and social entrepreneurship strikes some people as a way to shorten it. The myriad practical details about how to accomplish this fall well beyond the scope of this short chapter. Durieux and Stebbins (2010) do move in that direction, however, in that they provide a practical guide for establishing social enterprises.

## The Career Volunteer as Social Entrepreneur

Career volunteering is one of the three types of serious leisure (Stebbins 2007/2015). Serious leisure is the systematic pursuit of an amateur, hobbyist, or volunteer activity that people find so substantial, interesting, and fulfilling that, in the typical case, they launch themselves on a (leisure) career centered on acquiring and expressing a combination of its special skills, knowledge, and experience. It takes considerable commitment to stay with an activity like developing a social enterprise and to stay long enough to acquire the special skills, knowledge, and experience needed to succeed. A sense of career emerges from acquiring these skills, knowledge, and so on. The serious leisure that social entrepreneurs pursue is that of the volunteer.

Among the benefits volunteers commonly gain are the acquisitions and rewards mentioned in the preceding paragraph, expressions of gratitude from the target of benefits, and valued identity of being a volunteer for a particular cause or organization. Social entrepreneurs volunteer their time, and not infrequently their money, to start up and guide to fruition their own enterprises. They are not as such volunteers in someone else's group or organization. This is what distinguishes the volunteering entrepreneur, for the vast majority of today's volunteers are engaged by another group or organization or, even more obscurely, work within a social movement to support a cause of some kind.

## Casual and Project-Based Volunteers

The career (serious leisure) volunteers are the ones who start up and run social enterprises. Their volunteering is substantial and highly complex and is to be distinguished from casual leisure and project-based volunteers. Casual leisure is short-lived, immediate, hedonic activity; it requires little or no skill or knowledge to enjoy it (e.g., taking a nap, gossiping about workmates, watching entertainment television). Casual volunteering includes stuffing envelopes, distributing leaflets on a street corner, and taking tickets at an event.

Project-based leisure refers to a short-term, moderately complicated, either one-shot or occasional, though infrequent, creative undertaking carried out in free time. It requires considerable planning, effort, and sometimes skill or knowledge, but for all that is neither serious leisure nor intended by the participant to develop into such. Common projects include surprise birthday parties, enjoyable home improvements, and volunteer service at arts festivals and games (competitive events in an art or sport).

The career volunteer who sets up and runs a social enterprise will probably have to engage other career volunteers and possibly some casual and project-based help as well. Beyond the founder or founding group, career volunteers in a social enterprise may include lobbyists, legal advisors, publicity specialists, and a secretary or treasurer in a board of directors, among many other possible serious participants. The typical social entrepreneur will recognize such people as

kindred spirits, in that they find the same kinds of rewards and levels of commitment in their leisure.

Nonetheless, nonprofit social entrepreneurs often need one or both of the other two types of volunteers: those serving in casual roles and those serving in projects. True, the serious volunteers could also conceivably act in these ways, but this strategy risks overusing such valuable people. So the wise entrepreneur searches for other helpers to meet casual needs and those met through projects. The chief point to be made in the present chapter is that these two types of volunteer are looking for their own leisure experiences, of the sort described in the definitions of them set out above.

Casual and project volunteers can certainly become committed to the tasks they have agreed to perform. But for this to happen, the tasks must be short term. For these volunteers, where they are looking for long-term altruistic involvement, they would also be looking for opportunities to volunteer as serious leisure.

## Obligation and Commitment as Parts of the Explanation

Unlike work, most leisure is free of obligation (it *is* un-coerced), but that said there are some interesting exceptions to this rule. One, for example, is that social entrepreneurs are occasionally obligated to attend a meeting of the leaders of their enterprises or present a talk about their mission, which, however, they usually want to do. In other words, agreeable obligations can be part of leisure; it is the disagreeable ones that cannot logically be considered leisure (see the next section).

Another exception is those entrepreneurs who intend to develop a for-profit social enterprise and from which they hope to derive a livelihood. There is also a leisure sense about the way this will be accomplished, but it is, in the end, work or work related. We return to this approach to entrepreneurship in a later discussion on "devotee work."

### Moral Obligation and Commitment

While discussing obligation as an explanation of entrepreneurship, it should also be noted that strong moral obligations drive some people to develop social enterprises. To the extent they feel coerced into social entrepreneurship, they are not doing it as leisure. Entrepreneurs fired by, for example, strong religious convictions, powerful beliefs about a certain social injustice, or a nagging sense of imminent environmental disaster feel that they have no choice but to act and to get an ameliorative social enterprise up and running.

Nonetheless, this motivational scenario is not leisure – it assumes that they would rather be doing something else in their free time – but neither is it work. For few if any of these advocates (some are crusaders) foresee a livelihood in their cause. Still, it is an obligation and one to which they are powerfully committed. In the serious leisure perspective, this kind of obligation falls into a third domain of life, namely, that of nonwork obligation. It is the area of life containing all those unpleasant things that must be done but that cannot be classified either as work or as leisure, the other two domains (Stebbins 2009).

Other social entrepreneurs, those not driven by disagreeable obligation, also have a strong commitment to their enterprise and its mission. This is something they most certainly want to do and therefore choose to do. And, yet, it is something they could deny themselves, possibly because they lack the time, energy, money, knowledge, or other resources needed for such an undertaking. Commitment and leisure may seem like an odd couple, but in one form of leisure, namely, serious leisure, commitment is actually a central condition.

## For-Profit Entrepreneur as Occupational Devotee

Working as an occupational devotee is, in many ways, serious leisure (Stebbins 2004/2014). Occupational devotion refers to a strong, positive attachment to a form of self-enhancing work, where the senses of achievement and fulfillment are high and the core activity (the basic set of tasks in a general activity) is endowed with such intense

appeal that the line between this work and leisure is virtually erased. An occupational devotee is someone inspired by occupational devotion. Devotee work is the core activity of the occupation. It is capable of inspiring occupational devotion.

Occupational devotees turn up chiefly, though not exclusively, in four areas of the economy, providing their work there is, at most, only lightly bureaucratized: certain small businesses, the skilled trades, the consulting and counseling occupations, and the public- and client-centered professions. Public-centered professions are found in the arts, sports, scientific, and entertainment fields, while those that are client-centered abound in such fields as law, teaching, accounting, and medicine. Social entrepreneurs striving for success through a for-profit organization are, in effect, occupational devotees who are running businesses.

These entrepreneurs approach their work with the commitment and enthusiasm of a serious leisure participant. The main difference between the two is that the first is dependent on the enterprise for all or a substantial part of their livelihood. In the final analysis, however, the for-profit entrepreneurs are, in a special sense, coerced to work at their enterprise. Here, its leisure-like character gets blurred, for in reality going to work and making a living are also for many people two of life's obligations, albeit agreeable ones for the devotee.

## Devotee work

Having a passion for work, as every occupational devotee does, is rare. Most workers in this world are simply not fortunate enough to find jobs so highly agreeable as this. But for those who do find them, their work meets the following six criteria. To generate occupational devotion:

1. The valued core activity must be profound; to perform it, acceptability requires substantial skill, knowledge, or experience or a combination of two or three of these.
2. The core must offer significant variety.
3. The core must also offer significant opportunity for creative or innovative work, as a valued expression of individual personality. The adjectives "creative" and "innovative" stress that the undertaking results in something new or different, showing imagination and application of routine skill or knowledge. That is, boredom is likely to develop only after the onset of fatigue experienced from long hours on the job, a point at which significant creativity and innovation are no longer possible.
4. The would-be devotee must have reasonable control over the amount and disposition of time put into the occupation, such that he can prevent it from becoming a burden; medium and large bureaucracies have tended to subvert this criterion. For, in interest of the survival and development of their organization, managers have felt they must deny their nonunionized employees this freedom, and force them to accept stiff deadlines and heavy workloads. But no activity, be it leisure or work, is so appealing that it invites unlimited participation during all but a few waking hours.
5. The would-be devotee must have both an aptitude and a taste for the work in question. This is, in part, a case of one man's meat being another's poison. John finds great fulfillment in being a physician, an occupation that holds little appeal for Jane who, instead, adores her for-profit social enterprise (a work John finds unappealing).
6. The devotees must work in a physical and social milieu that encourages them to pursue often and without significant constraint the core activity. In the area of social entrepreneurship, this includes avoiding excessive paperwork, funding crises, bitter policy disputes, governmental resistance, and the like.

Except for number 5, these criteria are delicate. A number of conditions that weaken them can easily arise, transforming what was a devotee job into one now largely disagreeable. Should this transformation occur, the devotee social entrepreneur, if he or she stays with the enterprise and its mission, becomes an entrepreneur substantially driven by disagreeable obligation. Here, the devotee and the leisure qualities of the activity have become appreciably undermined by uncontrollable external forces.

So it happens that work and leisure, in general, and social entrepreneurship, in particular, are not always so easily separated. While casual leisure and non-devotee work can be seen as separate coins, serious leisure and devotee work can only be logically seen as the two sides of a single third coin. The second is serious leisure from which one makes a part or all of one's livelihood.

Up to now in this chapter, discussion has centered on three kinds of social entrepreneur: agreeably obligated volunteer/nonprofit, disagreeably obligated (nonprofit/for-profit), and agreeably obligated for-profit. Whichever kind the individual enterprise is, it is highly probable that, at least in the early stages of its development, the social entrepreneur will also be engaging volunteers to help realize the entrepreneurial mission. But, to the extent that the enterprise comes to be driven by profit motives, reliance on volunteers tends to disappear in proportion. They are almost exclusively found in the nonprofit, or third, sector of the economy, if for no other reason than that their altruistic motive of giving selflessly squares poorly with the business ethic of being remunerated for a job for which someone else can afford to pay.

## Conclusions

There is much more to being a social entrepreneur than wanting to do something beneficial for other people or for the flora, fauna, and the natural environments of this world. In the case of the for-profit enterprise, there is more to it than finding a livelihood and wanting to do something beneficial at the same time. To be sure, these are real motives, and as such they help explain social entrepreneurship. But they are also incomplete as explanations.

That is, taken alone, they simplify a complex activity and its impact in an age when existing governmental and nongovernmental organizations are either unable or unwilling to solve crucial social problems. By analyzing social entrepreneurship within the framework of the serious leisure perspective (which includes occupational devotion), one gains the additional sense of how the search for personal and social rewards, experience of the core activity, and the contexts of society, culture, and history can enrich our understanding of it. True, little has been said in this chapter about rewards and context (see Stebbins 2007/2015).

# Social Entrepreneurship Education as a Viable Approach to Building Resilient Communities

James Agbodzakey, Karen Shumway and Matthew Houston
University of North Texas at Dallas, Dallas, TX, USA

## Synonyms

Social enterprise; Social entrepreneurship

S

## Definition

**Social entrepreneurship**: Engaging in new and innovative activities geared toward creating social value and producing measurable societal benefits.

**Building resilient communities**: Equipping communities with capacities to identify and address vulnerabilities as well as withstand and/or recover from major incidence(s) that impact viability and sustainability.

**Dallas southern sector**: South of Interstate 30, including the communities of West Dallas, Oak Cliff, South Dallas/Fair Park, Pleasant Grove, and Southeast Dallas.

## Introduction

Opportunities to promote economic development and socioeconomic mobility are plentiful in Dallas County, especially in the southern sector loosely defined as south of Interstate 30, including the communities of West Dallas, Oak Cliff, South Dallas/Fair Park, Pleasant Grove, and Southeast Dallas. Implementing a social entrepreneurship approach that fosters social enterprises by either individuals or collectives could be the antidote to much needed transformational change in southern Dallas County. Such an approach will empower residents, especially the youth to be change agents in the transformation of their communities. Similarly, a social entrepreneurship approach will effectively complement existing economic development agendas coordinated by the City of Dallas such as the Grow South Initiative and the South Dallas/Fair Park Opportunity Fund as well as emerging private ventures from existing community nonprofits and business advocacy organizations such as the Dallas Black Chamber of Commerce and the Greater Dallas Hispanic Chamber of Commerce.

Existing economic growth statistics points to an economic divide between northern and southern Dallas County. As of 2017, 86% of jobs, 83% of property values, and 86% of permit values were associated with the north while the south shares compared at 14%, 17%, and 14%, respectively. The consequence of inequalities between north and south values amounts to billions of dollars in economic disparities in income, debt and assets, as well as education (Joseph and Cowan 2017). The median income of residents in Dallas County, especially Blacks and Hispanics who live mostly in the southern sector, is less than 60% of their Asian and White counterparts (U.S. Census Bureau 2015). About 30% or more of residents have subprime credit scores and 65% spend more than 30% of their income on rent; 73% of Dallas County public schools students are disproportionately economically challenged which implies eligibility to receive some food-related assistance from the federal government; and White residents stand a better chance of completing bachelor's degree, at least 2.4 to 5.2 times than their Hispanic and Black counterparts (Groves and Tingle 2018; Texas Education Agency 2016; U.S. Census Bureau 2010).

The disparities as referenced are staggering and unlikely to promote the county's socioeconomic health in the long term, especially as measured per capita. There is a need to build resilient communities in southern Dallas County that act as conduits to promote equity in socioeconomic development and ensure sustainable living wages. Education, especially social entrepreneurship education has the potential to be a catalyst to building and fostering resilient communities. Building resilient communities means equipping them with capacities to identify and address vulnerabilities as well as withstand and/or recover from major incidence(s) that impact viability and sustainability.

For the purposes of this entry, social entrepreneurship is defined as engaging in new and innovative activities geared toward creating social value and producing measurable societal benefits. The new and innovative activity can be sector specific, i.e., public sector, business, or nonprofit. The activity can also be interconnected across sectors in ways that help address a complex or an endemic social problem plaguing a community. The concept of social entrepreneurship is synonymous to social enterprise. It is used interchangeably with social enterprise to denote business ventures with missions focused on garnering societal benefits.

The realization of emergent opportunities for social value creation in economic, social, education, transportation and health issues in Dallas County, especially southern Dallas, motivates the Urban SERCH Institute (SERCH) and School of Business (SB) at UNT Dallas to embrace social innovation through tailored training and education programs. In fact, SERCH and SB's efforts are inextricably intertwined with UNT Dallas mission to "empower students, transform lives and strengthen communities" (UNT Dallas 2020).

UNT Dallas's strategic location and mission support SERCH's and SB's commitment to be conduits for social innovation through cutting edge training and development of social entrepreneurs. With support from like-minded entities and individuals, the partnership between SERCH and SB will help to collectively transform communities and empower individuals to facilitate much needed socioeconomic improvements.

This paper is written as a prospectus with a goal to explore community interventions through social enterprise education. It will also discuss the various components of a model social entrepreneurship program, its significance, benefits, and best practices in social enterprise education.

## Intervention Through Social Entrepreneurship Education

Dallas County is very cosmopolitan and diversity is apparent in many spheres of life. As of 2019, the county has over 2.6 million people. Hispanics constitute 40.5% of the population; Whites 28.5%; Blacks or African-American 22.4%; Asians 6.7%; American Indians and Alaska Natives 1.1% (U.S. Census Bureau 2019). The county is projected to grow to about 3.8 million people by 2050 with people of color likely to constitute about 80% to 88% of the population (Texas Demographic Center 2019).

The current demographics of Dallas County and long-term projections suggest that people of color are the cornerstones to the county's socioeconomic health and development. Yet there is apparent geographical separation based on race and ethnicity (Groves and Tingle 2018). Historically, policies drew lines of demarcations to separate communities culturally, ethnically, and economically, isolating historically disenfranchised populations and preventing them to benefit in the economic advancements reaped by the majority White business community in the county (Glasrud 1974). Practices such as redlining during the Jim Crow era also proved to be problematic for communities of color to advance socially and economically in the area (Macon 2017).

Disparities in areas such as income, education, and health are also apparent and strongly correlated with geographic location in Dallas County. The average Black or African-American in the workforce earns 54 cents and Hispanics 58 cents of every dollar earned by their White counterparts (Groves and Tingle 2018; U.S. Census Bureau 2015). Educational attainment is also low with only 16.5% of disadvantaged students earning a college degree or certification (Texas Higher Education Coordinating Board 2017; Groves and Tingle 2018). These disparities, even though dire, present opportunities for constructive and innovative solutions with social entrepreneurship education as one of the viable means to promote change and consequently empower individuals and build resilient communities.

Education, especially higher education, in many ways is considered as an opportunity equalizer (Marina and Holmes 2009). Educating youth in southern Dallas County, especially in social entrepreneurship, will build their skill sets as change agents capable of building resource bases to develop and support resilient communities. In fact, some scholars accentuate the role of education in promoting equity and empowerment that advances individual and communal well-being (Winkle-Wagner and Nelson 2009; Blau and Duncan 1967; Benedict and McClough 2010; Growe and Montgomery 2003; Bernardi and Ballarino 2016). Social entrepreneurship education as proposed will be community-centric. Youth with keen interest in using business approaches to help address endemic social problems in their communities will be identified, recruited, and supported through all stages of their entrepreneurship education.

The proposed social entrepreneurship program is inextricably connected with the mission and vison of UNT Dallas, the only comprehensive 4-year urban public university in the city limits of Dallas. The university's vision encapsulates education and community connectedness as a conduit to viable social and economic mobility (UNT Dallas 2020). Collectively, the university's driving rationale coupled with its location, which is in the midst of communities plagued by multiple vulnerabilities, places UNT Dallas in a unique position to serve as a catalyst in transformational change.

In the 10 years of its existence, UNT Dallas has been steadfastly focused on its education and community transformation agenda for societal benefits. For instance, in the 2018–2019 academic year alone, about 900 plus students graduated from various disciplines and most of these graduates are currently working and spearheading change in various communities in southern Dallas through efforts with nonprofits, local governments, and private entities (UNT Dallas News 2019). The Urban SERCH Institute (SERCH) and School of Business (SB) will develop and implement a model social entrepreneurship program that is scalable to the growth of both the university and the surrounding communities. SERCH will facilitate multistakeholder engagements to disseminate and realize established program goal and objective. The School of Business' extensive pragmatic educational methodologies and proven connectedness with key players in industry will enrich program content and attendant experiential learning components. With additional support from community partners, the social entrepreneurship program will build a synergy among its components that will enhance current community development efforts to better leverage resources and knowledge with resulting exponential improvements in outcomes.

## Components of the Social Entrepreneurship Program

The intent of SERCH and SB Social Entrepreneurship Program is to develop social entrepreneurs with keen interest in the local system context to provide meaningful market-based solutions to the complex social challenges in the various communities of Dallas County, especially southern Dallas County, and eventually, the State of Texas. The program will equip participants with much needed social entrepreneurship, technical, and business skills, and competencies to effectively facilitate change through innovative social enterprises. The participants will enroll in a five-course Social Entrepreneurship Certificate Program on the campus of the University of North Texas at Dallas with a curriculum that is firmly rooted in social enterprise principles and practices within the larger framework of market-based solutions. Eventually, a satellite campus will be established by capitalizing on the existing partnership with Dallas County Community College District (DCCCD), which is now called Dallas College, to maximize access and presence in the community.

The goal is to train 150–200 social entrepreneurs within a 5-year period consisting of 20–25 students per cohort in a 6 months-to-a-year using innovative and evidence-based curriculum with attendant experiential learning components. The experiential learning component will cut across local, state, regional, national, and international domains to help develop relevant competencies to foster the generation of much needed social impact for the communities' benefits. Relatedly, the following objectives in consonance with program intents and purposes are established: (a) to grow social entrepreneurship knowledge of participants through evidence-based social enterprise curriculum with specific student learning objectives, (b) to equip participants with the relevant skillsets for success through innovative social enterprise rooted in market-based principles and practices, (c) to enhance abilities of participants to promote effective engagement and collaboration with stakeholders across public, private, and nonprofit spheres toward purposeful ends, (d) to help participants develop unique competencies through extensive experiential learning at key innovative market-based enterprises with established tradition of social responsibility and social impact, and (e) to create a pipeline of

entrepreneurs who can also serve as consultants to foster sustainable solutions through engagement with various entities that focus on innovatively addressing complex social problems. The program curriculum and attendant instruction by experienced and highly-credentialed faculty and professionals are the pathways to attain student learning objectives.

### Curriculum

The curriculum will be innovative and evidence-based using highly-credentialed faculty and professionals to deliver relevant and timely market-based social enterprise content. A distinguished innovative entrepreneurship guest speaker series of accomplished business and social enterprise entrepreneurs will augment the curriculum. An experiential learning component consisting of individual and group mentorship, field trips, conferences, social innovation lab, and social entrepreneur-in-residence, knowledge network, and placement with key market-based social impact entities will be included for an integrated experience.

Examples of courses to be taught in the Social Entrepreneurship Program will include:

(a) *Microfinance and Applied Finance in the Social Sector:* Course that connects multiple business principles (Finance, Accounting, Economics, and Microfinance) and applies them to the entrepreneurial journey
(b) *Strategic Perspectives and Principles in Social Entrepreneurship*: Course in strategy that will introduce participants to various schools of thought in strategy. Students will learn to apply each to their entrepreneurial pursuits
(c) *Sociology of Social Sector Entrepreneurship:* This course connects the study of society, patterns of social relationships, and social interaction to the building, scaling, and growing of businesses in an economic ecosystem, specifically in an entrepreneurial venture that places an emphasis on building on the social good
(d) *Fundamentals of Social Impact Investing:* Course that relates the rudiments of social impact investment in vulnerable communities for social value alongside attendant financial rewards/returns, and
(e) *Cases in New Venture Leadership and Management*: Course that uses relevant conceptual and practical cases in social ventures in emergent and established economies/societies. The courses as referenced will collectively blend relevant conceptual and functional competencies that are essential to equipping the participants for various social enterprise endeavors including management and sustainability. Furthermore, practical components involving experiential learning, innovation labs and mentorship among others will expose participants to contemporary realities of social entrepreneurship within local and regional contexts to foster comprehensive and collective understanding of relevant components. The uniqueness of the program is grounded in its synergy to draw on and leverage capacities and strengths of multisector collaborative stakeholders to help create innovative solutions to endemic social problems and doing so from collective multisector lens.

### Target Groups and Enterprise Solution Component

The intent of the social entrepreneurship program, especially the resolve to bolster collective social impact as a conduit to community transformation, will guide recruitment of participants. While the program will be inclusive in its approach, the underlying commonalities in upbringing and community experience in underserved and under-resourced setting, coupled with a passion for enterprise solutions to endemic social challenges will guide selection into the program. Consequently, the target groups for the social entrepreneurship program will be a blend of associate degree holders from any of DCCCD programs, bachelor's degree holders from Paul Quinn College, and bachelor's and graduate degree holders from UNT Dallas programs. Similarly, individuals and community stakeholders with related and relevant qualifications, and with demonstrated interest in innovative social enterprise as an alternative approach to social and

economic viability, especially for Dallas County communities, will be considered as well. The focus on participants from the various communities is to foster change agent roles by empowering them to creatively use their acquired social enterprise competencies, business skillsets, innovation, and passion for community solutions to engineer transformational change.

The enterprise solution component of the program will be an attempt to foster collaboration between for-profit, nonprofit and public entities relative to promoting viability and sustainability. The startup seed funding of $50,000 with guarantees from SERCH and School of Business and other program collaborative partners will promote access to capital. Besides the likely microcredit arrangements, SERCH and SB Business Education Innovation Lab will work with program participants to apply for general and categorical grants, bid for low threshold contracts from the City of Dallas among others and provide technical assistance during the life cycle of each project. Proposals focusing on endemic challenges in southern Dallas, i.e., food insecurity, neighborhood development, property development and management, innovation in public safety, career readiness education, transportation, reentry and reintegration of offenders, creative waste management, sustainability, innovation in poverty alleviation, promoting health equity and culture of health among others will be supported. Intentionality relative to participants' diverse cultural backgrounds, but with similar socioeconomic predicaments, demonstrated passion for social solutions for social impact, understanding of sound financial management principles, viable implementation plan and relentless resolve to make change even in instances of mounting and dire personal and professional challenges are some of the characteristics that will shape consideration for seed funding.

## Social Entrepreneurship Model

The model/figure 1 below depicts the multisector collaboration in social entrepreneurship education as a conduit to building resilient communities. Education takes the center stage in this model/figure 1 because of its catalytic role in fostering knowledge, skills, and abilities of program participants with eventual empowerment and economic mobility at both the individual and community

**Social Entrepreneurship Education as a Viable Approach to Building Resilient Communities, Fig. 1** Model designed by the authors, Agbodzakey, Shumway and Houston (2020)

levels. The linkages of aspirations and interests coupled with shared understanding, communication, and commitment of collaborative partners to the established program goal and objectives create the needed synergy for constructive outputs and/or outcomes for societal benefits. Furthermore, the model/figure 1 underscores the essence of robust and integrated partnerships grounded in a common resolve to ameliorate, if not eliminate, endemic vulnerabilities that plague various communities in southern Dallas County. In essence, the model's uniqueness is rooted in its focused intervention and local value proposition for societal benefits.

This social entrepreneurship program will be a collaboration between SERCH, School of Business, UNT Dallas, Dallas Black Chamber of Commerce (DBCC), Greater Dallas Hispanic Chamber of Commerce (GDHCC), Dallas County Community College District, (DCCCD), now Dallas College, Dallas Entrepreneurship Center (DEC), Dallas Regional Chamber (DRC), Greater Dallas Asian American Chamber of Commerce (GDAACC), the African American Leadership Institute at Paul Quinn College, Star United Global Outreach (SUGO), Career Services at UNT Dallas, like-minded community-oriented foundations, individuals and corporate investors and other emergent partners based on the evolution of the program. These partners will play unique and critical roles and collectively help achieve the intents and purposes of the program for the communities' benefits. For instance, the chambers of commerce, foundations and corporate partners will be heavily involved in resource generation, mentorship, and experiential learning among others while the civic and educational partners will mostly help shape the curriculum, strategic community engagement, workshops and seminars, innovation lab, etc. to augment SERCH & SB efforts in general. The uniqueness of this partnership is grounded in its extensive multi-stakeholder engagement of state-owned educational institutions, private, and nonprofit entities including chambers of commerce, private equity lenders/angel investors among others which represents the convergence of three (3) spheres for collective impact and the opportunity for collaborative education/learning and sustainable outcomes based on the collective resolve of all the partners involved.

## Significance, Benefits, and Best Practices

The growing complexity of social problems and their endemic nature call for innovative approaches to foster viable and sustainable solutions. While government and private sector entities promote policy-based and profit-oriented approaches/solutions in their respective capacities, there still appears to be some gaps in constructively addressing complex problems i.e. poverty, homelessness, lack of affordable housing, inequity in urban infrastructure and transportation, and others plaguing various communities in Dallas County. Social entrepreneurship which encourages innovative activities to help create social value has become an accepted approach in both developed and emerging economies for addressing such complex social problems. Scholars such as Austin and Rangan (2019), Austin et al. (2003), Kokko (2018), Lyne et al. (2018), Thorgren and Omorede (2018), Dionisio (2019), Finlayson and Roy (2019), White et al. (2018), Akella and Eid (2018), Shin (2018), Tian et al. (2018), MacMillan and Thompson (2013), and Bornstein and Davis (2010) among others persuasively postulate how social entrepreneurship serves as an antidote to complex societal challenges based on its use of innovative community-centric enterprise-oriented undertakings. For instance, Austin and Rangan (2019) constructively document Harvard School of Business' experience with social entrepreneurship education in the past 25 years involving multi-sector stakeholders and emphasizing the use of cases in developing areas/Global South to inform both theory and praxis. The program has multiple components in instructional and practical terms and so far, graduated 7,565 students at the graduate level and 12,329 executive practitioners from various parts of the world with additional scholarly output of over 1000 cases to highlight associated social enterprise efforts (Austin and Rangan 2019, p.12).

The proactive and collaborative nature of the proposed SERCH and SB program once implemented is likely to lead to some direct and indirect benefits to participants, communities, and the county at large. The likely benefits are: (i) empowered county residents who will creatively help address endemic social problems in the various communities, (ii) equitable economic development as the emergent entrepreneurs foster economic opportunity in Dallas County, especially southern Dallas, (iii) empowered communities as the created economic opportunities promote social viability and sustainability, (iv) increased tax base as a result of the innovative social enterprise activities positively improve the city's revenue base and consequently improve the community's access to additional development funds, and (v) enhanced economic mobility for individuals with attendant benefits to families and communities. Regular evaluation of program content and attendant outputs/outcomes will be informed by both direct and indirect measures.

Academic institutions and affiliated centers and institutes have embraced social entrepreneurship because of its viability as an alternative approach to community problem solving. Notable institutions such as Harvard University, University of Pennsylvania, University of Southern California, and numerous others have integrated social entrepreneurship as part of their emergent innovative curriculum. Thus, the entrepreneurship program fosters training and empowerment of students and practitioners to play change agent roles in community problem solving. Consequently, the SERCH and SB Social Entrepreneurship Program will benchmark the Harvard Business School Social Enterprise Initiative and the Brittingham Social Enterprise Lab (BSEL) model at the University of Southern California's Marshall School of Business as well as other proven programs in the US and overseas. Furthermore, the program will have an Advisory Board to promote viability and sustainability and a Social Enterprise Knowledge Network (SEKN) consisting of local, national, international/global social entrepreneurs to foster sharing of practical knowledge and expertise. Modeling best practices of the referenced established programs in curriculum and social innovation lab will bolster training of entrepreneurs with a passion to help address social problems in Dallas County, especially in southern Dallas and by doing so enable building of resilient communities.

## Conclusion

Is there a hope for southern Dallas? And can the endemic social problems be mitigated? This paper attempts to highlight a proposed social entrepreneurship education program involving multisector stakeholders targeted toward individuals with common socioeconomic background and experiences, but with a passion to make change for personal and communal well-being. The program is conceptualized as an innovative approach to tackling endemic social problems using insights from established programs at Harvard Business School, and University of Southern California Marshall School of Business among others, but with a particular attention to Dallas.

Education is believed to be an impactful equalizer (Bernardi and Ballarino 2016; Marina and Holmes 2009) and such will be the case in southern Dallas if the targeted social entrepreneurship program is implemented. While it might not entirely eradicate endemic social problems that plague southern Dallas, it can be a genesis of sustainable systems and a social impact approach to building resilient communities by relying on individuals with understanding of the local system context and collective solution-oriented interests to spearhead transformational change for the communities' benefits. There is no doubt there will be systems and resource challenges to implementation, but the common resolve of the multisector stakeholders should help trump any such emergent situations and/or occurrences.

# Social Equity Leadership

Bridgette Cram and Mohamad Alkadry
Florida International University, Miami, FL, USA

## Definition

Social equity is defined by the National Academic of Public Administration (2010) as "The fair, just and equitable management of all institutions serving the public directly or by contract; the fair, just and equitable distribution of public services and implementation of public policy; and the commitment to promote fairness, justice, and equity in the formation of public policy."

## Introduction

The concept of social equity in public administration was not fully elaborated upon until H. George Frederickson's penned the essay, "Towards a New Public Administration," in response to the 1968 Minnowbrook Conference. Social equity continues to develop, and although it is now formally recognized as a pillar of public administration, there are still several challenges to overcome in terms of effectively benchmarking and measuring social equity outcomes. The relevance of social equity to public administration is evident, as it is the public administrator's duty to implement laws. Implementation often requires discretion and an understanding of how a law will affect different members of society; thus, social equity becomes critical as public administration is law in action. Although there have been significant challenges, social equity leadership has evolved, including leaders in both academics and in practice. To understand this development and the current state of social equity leadership, it is important to note the history of social equity as a pillar of public administration and to describe how social equity has been operationalized through various movements, including diversity, diversity management, and, most recently, cultural competency. It is important to note the social equity leadership involves leadership in public service organizations and leadership in delivering public services to communities. In this chapter, we discuss the bases of social equity in public administration, manifestations of social equity in public administration, and some recommendations on the path forward.

## Social Equity and Public Administration

The concept of equity in public administration can be found in some of the earliest works within the discipline. Woodrow Wilson's 1887 essay "The Study of Administration" briefly mentions equity in context of administration of law in balance with enlightenment and speed, and Henri Fayol mentioned equity as one of his fourteen Principles of Management in 1916. Aside from these two classical works, social equity was not the focus of early public administration, due to the fact that economy and efficiency were the principle values of the time.

Social equity in public administration gained significant momentum with the New Public Administration movement, which was developed in response to the numerous social movements of the 1960s and 1970s (Frederickson 2010). Hosted by Dwight Waldo, the conference brought together public administration scholars to establish the future direction of the field. The result of this conference was the beginning of the New Public Administration movement. The impact of the New Public Administration movement was immediately noted in H. George Frederickson's essay, "Toward a New Public Administration." Frederickson called for social equity to become a normative part of public administration through increased participation, advocacy, and a move away from neutrality to achieve equitable distribution of goods and services.

Public administration scholars pulled heavily from Rawls' (1971) "Theory of Justice" to further establish social equity within the field. Hart (1974) argues that the theory of justice provides helps to create ethical guidelines and consensus for public administration, which gives social equity the "force" it needs to be accepted. To

further build the case, Frederickson (1976) published another essay related to the development of a theoretical base for social equity within public administration. "The Lineage of New Public Administration" argues that economy, efficiency, and effectiveness are worthy values; however, they should not predominate. Frederickson argues that instead, values of responsiveness, worker and citizen participation in decision-making, social equity, citizen choice, and administrative responsibility for effectiveness should serve as the normative base of public administration. Thus, social equity leadership in the era of New Public Administration was comprised of scholars who fought to include social equity within the normative base of the field and continued to move the social equity agenda forward in the face of criticism.

## Social Equity as a Pillar of Public Administration

In recognition of the challenges facing social equity and its continued development, the National Academy of Public Administration established the Standing Panel of Social Equity in 2000 and adopted social equity as the fourth pillar of public administration. To ensure that the concept of social equity would be viewed as equal to the other three pillars of economy, efficiency, and effectiveness, the standing panel established guidelines, as well as criteria for measuring social equity: procedural fairness, access, quality, and outcomes (Johnson and Svara 2011). Procedural fairness involves ensuring that due process and equal rights and protections are guaranteed. Access involves an assessment of levels of access to services and implementation of equality measures (equitable, differentiated, targeted, or redistributive) to address unequal access. Quality refers to process equity or the concern of whether services are delivered consistently to different groups. Outcomes examine if there are equal or differentiated outcomes for groups.

In terms of implementation, the guidelines presented by NAPA provide some direction, but challenges with measurement persist. The main difficulty in achieving social equity is the disagreement about what social equity means when translated into the professional context, as it heavily relies on normative concepts (Gooden and Portillo 2011; Norman-Major 2011). Scholars argue that it is necessary to find an applied definition for social equity and that assessment methods will be sure to follow, allowing for baseline data to be collected and improvements to be made (Norman-Major 2011). The difficulty in defining social equity leads to additional difficulty in understanding how public administrators can be equitable leaders. In consideration of this, scholars began to pay significant attention to how public administrators at all levels have discretion to impact service delivery and thus impact equity (Rice 2004).

## Operationalization of Social Equity

In consideration of the challenges that social equity presents, there were several movements that attempted to operationalize social equity, provide more concrete definitions of what social equity means for public administration, and demonstrate what an equitable public administrator looks like. To examine what social equity leadership is, it is important to turn to how this concept has been operationalized by practitioners. Bailey's (2010) Representative Bureaucracy continuum demonstrates the development of how public administration has dealt with issues of diversity and social equity. The continuum is split up into four phases: equal employment opportunity (EEO), affirmative action, managing diversity, and cultural competency. For the purposes of this review, EEO and affirmative action are combined under the category of diversity. Viewing social equity leadership through this continuum outlines how leaders have embraced social equity and highlights the gaps that must be filled to ensure stronger social equity leadership in the future.

## Diversity

To enhance the equity of the United States, the Civil Rights Act was passed in 1964. This act

protected citizens in terms of race, gender, religion, or origin from being denied equal access to federally assisted programs. As a part of this act, the Equal Employment Opportunity Commission (EEOC) was established. The EEOC mandated that employees could not be discriminated against and attempted to provide equal opportunity for all. In addition to EEO, affirmative action was developed to further end discrimination. As EEO prohibited discrimination, affirmative action was more remedial in nature and sought to provide solutions to make up for historical discrimination. Affirmative action, unlike EEO, was largely voluntary; however, its legality and constitutionality have been challenged several times.

Leadership during this time was focused on ensuring that organizational practices were not discriminatory in nature, as to avoid legal repercussions. In addition, policies such as affirmative action have led to the incorrect interpretation that "quotas" are necessary to increase diversity; not only is this incorrect, but a quota system may have a negative impact on the people hired, as it may cause resent and feelings that the new hires didn't fully "earn" the benefits they received (Borrego and Johnson III 2012). Furthermore, programs such as affirmative action were based on the premise that leaders needed to be coerced in order to induce change and that the organization did not embrace these changes, but instead adapted an assimilation model, where new employees were instead expected to adapt and either "sink or swim" (Bailey 2010).

This era of diversity was driven by mandates and an assumption that simply increasing hiring of diverse employees was enough to redress historical inequality. This model was not effective in creating a culture of acceptance or focused on how to retain diverse employees. Thus, the transition to managing diversity addresses gaps in this initial operationalization of social equity.

## Managing Diversity

The second phase of the continuum is managing diversity. Managing diversity encourages organizations to move beyond the assimilation model into a synergy model. Public administration research continued to advance, and the move toward managing diversity was influenced by findings that valuing diversity was positive for organizational effectiveness (Cox and Blake 1991). Furthermore, if an organization could effectively manage diversity, they would see increases in employee retention, enhanced productivity, and creative problem solving, as well as attract more talented employees from diverse backgrounds (Mathews 2010). Mathews (2010) defines diversity management as "systematic and planned programs or procedures that are designed to improve interaction among diverse people, especially people of different ethnicities, genders, and cultures" (p. 214).

According to Pitts (2006), diversity management was strongly linked to human resource management. Pitts highlights three areas of focus within diversity management programs: recruitment, increasing cultural awareness, and policy alignment. Recruitment is critical to ensure a diverse employee base, and diversity has a positive impact on organizational outcomes. Diversity management then requires that employers understand that in order to retain diverse employees, they must maintain a positive organizational culture through enhanced awareness. In addition, policies that are adaptable and flexible (e.g., flex time, telecommuting) assist with recruitment and retention.

Managing diversity is an important development in social equity leadership, and it encouraged leaders within organization to take an active approach in embracing and retaining diverse employees. However, its primary focus was on how to structure the organization in terms of human resources. The transition to cultural competency addresses the behavioral aspects of interacting with diverse coworkers and citizens.

## Cultural Competency

Cultural competence is defined as "a set of congruent behaviors, attitudes, and policies that come together in a system, agency, or among professionals and enable that system, agency, or those professionals to work effectively in cross-cultural

situations" (Cross et al. 1989). Gooden and Portillo (2011) note that the role cultural competency plays within the framework of social equity is to obligate the public sector to understand and address the needs of the citizens they serve. Furthermore, cultural competency helps to bridge the gap between passive and active representation (Bailey 2010). Passive representation was part of a theory introduced by Kingsley (1944). This theory indicated that public administrators should be reflective of the citizens that they are serving. Active representation, on the other hand, asks whether or not bureaucrats actually act in favor of the demographic group that they represent (Krislov 1974). Active representation encourages the use of increased discretion to increase equity among those who have been historically underserved (Sowa and Selden 2003).

Cultural competence is an important development for social equity practice. Where diversity and diversity management primarily focused on race and gender or other characteristics that can be easily seen, cultural competence encompasses the breadth of characteristics that may impact an individual. While the diversity management movement highlighted the importance of approaching diversity from an organizational perspective, cultural competence builds on this organizational importance while also highlighting an effective approach for interacting with citizens (Rice 2010). Rice argues that service delivery has been "culture-blind" and that building cultural competence helps to bridge the service delivery gaps that exist.

In terms of cultural competency and public administration, Bailey (2010) states that it enhances responsiveness and effectiveness, as the goal is to best meet the needs of various clients. In terms of equity, public administrators must balance meeting clients' needs through discretion, with overarching organizational goals of treating all clients equitably. Cultural competency does come at the expense of increased efficiency; however, as Frederickson (2010) states, citizens are most likely to prefer services that are responsive to their needs, thus demonstrating acceptance that these choices may result in reduced efficiency.

The concept was first developed in the fields of medicine and psychology in the 1970s, and legal mandates, such as the Culturally and Linguistically Appropriate Service (CLAS) standards, were passed to ensure that language barriers would not prevent citizens from receiving public services (Rice 2010). Public administration scholars and practitioners have just recently embraced cultural competence as a set of skills that managers and leaders should possess within an organization. Due to the relatively recent focus on cultural competence in public administration, most of the research is concentrated into two books (Borrego and Johnson III 2012; Norman-Major and Gooden 2012) and throughout issues of the Journal of Public Administration Education.

Borrego and Johnson III (2012) highlight the importance of a competency model for public managers of all levels. These competencies focus on the knowledge, awareness, and skills that culturally competent managers must have at different levels of responsibility. First, it is important to understand cultural competency from within an organization. Public managers must understand not only how to navigate the various cultures of their employees but also how to include all cultures into the fabric of the organization. In summary, culturally competency managers must be able to respect diversity, know how to communicate with diversity employees, establish a shared organizational culture, be adaptable, and foster inclusiveness. Along with each of these foundational competencies, the authors present a set of measures that managers can use to establish how well they are developing on each one.

In terms of organizational cultural competence, there are several resources for managers to turn to. Rice (2007) and Mathews (2010) present self-assessment checklists to help assess how well the organization meets the needs of diverse citizens. These checklists are adapted from The National Center for Cultural Competence's cultural competence continuum. This continuum is a slightly modified version of Cross' (1989) work related to children's healthcare. The continuum is comprised of six phases: cultural destructiveness, cultural incapacity, cultural blindness, cultural pre-competence, cultural competence, and

cultural proficiency. A self-assessment helps organizations gauge where they fall along this continuum so that they can understand where improvements need to be made.

In addition to development of cultural competence within the organization, leading scholars in this area have also focused on how to better integrate cultural competency into the public administration curriculum. The Network of Schools of Public Policy, Affairs, and Administration established a new universal competency in 2009 that focused on diversity: "communicate and interact productively with a diverse and changing workforce and citizenry." The development of this competency sparked research related to cultural competency curriculum at the Master of Public Administration level. JPAE has been a significant publisher of these articles.

Cultural competency training prepares future leaders in public administration with the knowledge, attitudes, and skills they need to interact with a diverse citizenry and workforce. These competencies assist in achieving the goals of social equity through organizational systems that embrace culture and public service delivery systems that take citizens' diverse needs into account. And while cultural competency cannot completely solve all forms of social inequity, it does play an important role in increasing equity within public services (Norman-Major and Gooden 2012). Moreover, although diversity has been addressed extensively both within and outside of the university, it is critical that public administration scholars continue to research the structural inequalities that continue to exist and leaders at the local and national level implement policies and programs to address these inequalities.

## Manifestations of Social Equity Leadership

In 2016, almost 50 years after the Minnowbrook conference, the writing is on the wall when it comes to social equity in public administration. After 50 years of equal pay legislation, the wage gap persists. After almost 100 years of women's suffrage, women hold less than one fifth of elected offices at the State and Federal levels. Female public sector employees continue to be segregated in female-dominated occupations, in female-dominated agencies, and in lower echelon positions.

The view outside public organizations is not more pleasant. Phone cameras have shed a new light on police community relations. Gentrification is eating up real estate in minority communities. Highways and light rail lines are running over poor minority and white neighborhoods. So, where did we go wrong? Why are public sector leaders not delivering social equity outcomes? Why are they not allowing social equity principles to guide public agencies? What happened to all our theories of ethics, social equity, and public service motivation, and what explains our status quo today?

Public administration leaders are not entirely innocent in the less equitable outcomes seen in public organizations and in communities around the nation. Public administrators are at the heart of inequity in gender, race, and ethnic representation and equal pay issues. Equity-driven leaders would not discriminate against women and minorities in the workplace. Equity-driven leaders would not provide better promotion opportunities for men than women or whites over nonwhites. By the same token, social equity-driven leaders would not allow profit-driven developers to overtake poorer communities. Problematic outcomes in terms of social equity are hints that more work is needed on multiple fronts to equip public service leaders to identify equitable actions and to work toward social equity outcomes.

Gooden (2015) notes that public administration has made significant strides in bridging the gap between "the principle of equality and the performance of social equity" (p. 226). To meet the goal of achieving a truly equitable society, however, it will be necessary to continue development of accountability and performance measures. In addition, recommendations related to expanding the definition of efficiency to value the long-term benefits of equity could assist the integration of this value into the field (Norman-Major 2011).

To achieve this, support from ASPA and NAPA through projects, such as the fellowship for Social Equity Performance Measures, is critical to ensure that this topic remains a focus of the field. Furthermore, examining of programs that

demonstrate leadership in social equity, such as the Race and Social Justice Initiative out of Seattle, WA, can provide invaluable insight on how to replicate these programs in other cities and understand how social equity is being measured. This program is an example of how social equity translates into practice. Additionally, a specific focus on continued integration throughout the MPA curriculum is critical to ensuring that future public administrators are equipped with the knowledge and skills they need to be an equitable leader (Wooldridge and Gooden 2009).

## Conclusion

The changing demographics of the United States demonstrate why an increased focus on social equity and social equity leadership is imperative. However, when compared to economy, efficiency, and effectiveness, social equity has received the least amount of scholarly attention; however, pervasive issues still exists related to racial, gender, income, and cultural inequity. Due to the normative nature of social equity, public administration has faced several challenges in moving this agenda forward. In spite of these challenges, social equity leadership has evolved greatly over the past four decades, initially operationalized in the form of EEO and affirmative action policies, followed by a focus on managing diversity through appreciation of how this diversity could improve organizational effectiveness. Most recently, encouraging managers and organizations to adopt a more culturally competent approach is the new focus on how to more fully achieve social equity in public administration. The future of social equity in public administration will depend on how the traditional values of public administration can be reconciled with the work that must be done to achieve a more equitable society.

[2]The Wilder School of Government and Public Administration, Virginia Commonwealth University, Richmond, VA, USA

## Social Equity: An Overview

In today's increasingly divisive world, issues of inequity are at the center of policy debates and public frustration regarding a variety of social problems. Widening income gaps, unequal access to health and education resources, and tensions between racial and social groups are at the forefront of conversations, in particular for the public agencies looking to resolve them. In order to appropriately discuss these issues, it is helpful to reflect on the history and evolution of the concept of equity, why it is a concern for public administrators, and examples of negative consequences that can be both caused and rectified by the state. By examining the context of the social equity conversation, public administrators may better understand how to reduce inequities in society.

## Evolution of Social Equity

Although questions of equity remain more relevant than ever, the discussion of social equity as a concept has been documented as far back as Aristotle and Plato (Rutledge 2002). Both discuss the importance of equity as a type of justice among humans that may "go beyond the written law" and can evolve as a practice (Rutledge 2002). Despite rules, Rousseau argued, unequal distribution and economic needs create natural inequities and differences that "become more permanent in their effects" (Rousseau 1992). It was these basic ideals of justice and equality upon which the United States originated. Frustrated by political and social injustices, the early colonists defined in the Declaration of Independence that "all men are created equal" (Johnson and Svara 2011).

The 1960s and 1970s observed dramatic leaps in the application of social equity to the field of public administration (Wooldridge and Gooden 2009). The national context of these decades was centered on racial injustice and civil rights, highlighting the inequities of experience with government and institutions for different Americans based on their identity group. Frustrated by his observations of outdated approaches and conversations among political scientists, Dwight Waldo sought to convene a younger, more dynamic group of public administrators to discuss important issues in Syracuse, New York, for the first Minnowbrook Conference in 1968 (Wooldridge and Gooden 2009). The conference served as the foundation for the ideals of the New Public Administration, which rejected the Wilsonian dichotomy and acknowledged the importance of administrators in using their discretion to enforce and influence policies (Johnson and Svara 2011).

The role of administrators in promoting social equity was further solidified by Rawls' seminal 1971 work, "Theory of Justice," in which he described the importance of creation of institutions and policies that promote a just and fair society for those at the bottom (Rawls 1971). In 1990, prominent social equity scholar H. George Frederickson proposed the inclusion of equity as a "third pillar" alongside economy and efficiency as a central value for administrators; under this philosophy, public administrators focus not only on whether a program or policy is working but for

whom it works – a concept Frederickson refers to as the "second question" (Frederickson 1990). Shafritz and Russell argue that public administrators are tasked not only with administrating laws fairly and equitably but also promoting equity through maintaining a diverse workforce with equal opportunities and providing moral leadership and inspiration for citizens to behave fairly (Shafritz et al. 2007).

More recently, the concept of social equity has been broadened to include far more categories than race and gender, including sexual and gender identity, economic status, physical and mental disability, and more (Frederickson 2005). Inequities themselves have trended away from more overt forms of discrimination as witnessed in the 1960s and more toward subtle disparities in access and impacts that limit political participation and influence, skewing political responsiveness to more affluent groups (Frederickson 2005). Currently, the top 10% of American earners generate 90% of the country's income, prompting major concerns about the possible impact of this growing inequity (Saez 2015).

## Social Equity Defined

Though social equity has many technical definitions, its fundamental essence boils down to the broad values of fairness and justice; as Hart (1974) cites from Black's Law Dictionary, "[equity] denotes the spirit and the habit of fairness, justness, and right dealing which would regulate the intercourse of men with men – the rule of doing to all others as we desire them to do to us." Similar definitions of equity include: Rawls' theory of "justice as fairness" (1971); Adler's definition of social equity as "equal treatment to which all are entitled by virtue of being human" (Adler 1981); and Falk's description of equity as "impartiality, fairness, and justice" (Falk et al. 1993). Other more "complex" definitions expand the concept of social equity and apply it to public rights, access, and redistribution policy (Svara and Brunet 2005). The World Bank describes equity as "equal access to the opportunities that allow people to pursue a life of their own choosing and to avoid extreme deprivations in outcomes" (2006).

The Standing Panel on Social Equity in Governance of the National Academy of Public Administration (NAPA) defines social equity as "The fair, just and equitable management of all institutions serving the public directly or by contract, and the fair and equitable distribution of public services, and implementation of public policy, and the commitment to promote fairness, justice, and equity in the formation of public policy." Later in its strategic plan, NAPA identified social equity as being the fourth pillar of public administration. Goal 2 of this plan states:

> The Academy's Board of Directors adopted social equity as the fourth pillar of public administration, along with economy, efficiency and effectiveness. (NAPAWash 2000)

More recently, Johnson and Svara (2011) propose a new definition of social equity. "Social Equity is the active commitment to fairness, justice, and equality in the formulation of public policy, distribution of public services, implementation of public policy, and management of all institutions serving the public directly of by contract. Public administrators, including all persons involved in public governance should seek to prevent and reduce inequality and injustice based on significant social characteristics and to promote greater equality in access to services, procedural fairness, quality of services and social outcomes (p. 282)." Despite minor variances in definitions, these descriptions summarize the heart of the social equity concept for public administrators.

## Why This Concept Is of Concern to Public Administrators

Charles Darwin famously remarked in the early nineteenth century, "If the misery of the poor be caused not by the laws of nature, but by our institutions, great is our sin" (Wooldridge and Gooden 2009).

Much more recently, the National League of Cities stated:

> Governments at all levels is in part responsible for many of the glaring inequalities we see today and should therefore lead the way to solutions. Public policies adopted over time at the federal, state, and local levels have created and exacerbated many of the inequalities that our communities are struggling with today. (ESSENCE: The 2003 Futures Report Divided We Fall: Inequality and the Future of America's Cities and Towns, National League of Cities, 2003)

In response to this perception, the League created the Equity and Inclusiveness Endeavor which stated:

> Creating equitable and inclusive communities with opportunity for all can lead to a level playing field where everyone has a chance to succeed. The National League of Cities is exploring how government policies at all levels have contributed to increasing inequalities in America's cities and towns which threaten the well-being of regions and the nation. Divisions by race, class and geography have decreased access to much-needed jobs, adequate health care, affordable housing, and quality education. Through its leadership campaigns, research and publications, workshops and seminars, and advocacy priorities the National League of Cities is helping local officials create a sense of community and become trusted and reliable advocates for the well-being of all residents. (http://www.nlc.org/topics/index.aspx?SectionID=equity_inclusiveness)

Inequality undermines trust and community. It renders government vulnerable to special interests seeking to maximize short-term profit. Inequality, especially rising inequality, promotes status competition and social divisiveness and weakens the will of the many to organize to defend common interests against the specialized interests of the few. Inequality corrodes social bonds, erodes friendship, diminishes civic participation, and attenuates trust in government.

## How to Measure Social Equity

If the first step for administrators involves forming a basic definition for understanding social equity, the second involves the measurement of performance and results in order to assess and recognize inequities. By beginning to describe inequity through quantitative measures, administrators may begin to develop performance assessment benchmarks (Rutledge 2002). Several measures exist to assign numerical value to degree of equity. The first, and most widely recognized on an international scale, is the Gini coefficient measure of income inequality (Glaeser et al. 2011). The Gini coefficient represents the distribution of wealth in a community, with 0 representing equal distribution and 1 representing all wealth in the hands of one individual (Glaeser et al. 2011).

In the United States, the 2015 Gini coefficient of 0.482 represents a steady rise in income inequality since the 1970s figure of 0.406 (World Bank 2016). The rapid rise nationally in the 2000s can be attributed to the upward pull of the top 1% of income earners; if these exceedingly wealthy individuals are removed from the calculation, the curve becomes much flatter, though still reflects a widening income gap (Kenworthy and Smeeding 2013). This distinction is reinforced by the measure of relative poverty in the US over time, which represents income inequality in the lower half of the income distribution and has risen slowly but steadily for the 99% over the past decades (Kenworthy and Smeeding 2013). Metropolitan areas exhibit high Gini coefficients as compared to more rural areas, due mainly to the congregation of skilled workers and racial diversity within cities (Glaeser et al. 2011). In the United States, the highest Gini coefficients can be found in Miami and New Orleans at 0.5744, equivalent to the country of Zambia (Stilwell and Lu 2015).

Though the population's Lorenz curve provides perhaps the most widely recognized measurement, inequality may also be identified by other numerical values. Different data sources and dimensions may be compiled and assigned weights to create a single indicator of multidimensional inequality and poverty (Seth et al. 2014). A recent application of this technique combined indicators of education, health, and living standards (years of schooling, sanitation, electricity, child nutrition, etc.) to calculate deprivation scores for each individual, which can then be summarized and compared to examine differentials among groups, communities, and geographic areas (CEPAL 2015).

The social equity in Governance Standing Panel of the National Academy of Public Administration has provided four main criteria by which to measure equity: procedural fairness, access, quality, and outcomes (Johnson and Svara 2011). Data collected from policies and programs can illuminate different impacts and experiences in these dimensions across different groups. Using the example of health care provided by Hug (2011): access indicators include insurance coverage and use of regular doctor visits, hospital emergency visits, and dental checkups; measures of quality include disease management, preventative care such as vaccinations, and overall satisfaction with doctors; procedural equity can be indicated by number of referrals to specialists and ratings of patient-centered care; finally, overall outcomes can be reflected in data on mortality rates, heart disease, and cancer. If large disparities exist between groups in outcomes measurements, there is a fair chance that barriers to equity have occurred in one or more of the other categories (Johnson and Svara 2011). As Hug notes, accessing and analyzing the right data by group may prove challenging, but identifying disparities in performance remains the first step to achieving equitable outcomes (2011).

Quantitative data as described in the healthcare example can provide a critical component to assessing an agency's performance in achieving social equity and is often a reporting requirement for departments under the Government and Performance Results Act of 1993. Yet it is important not to discount the importance of qualitative responses or discussion about social equity at the agency's leadership level (Gooden 2014). An agency may commit to examining racial disparities in services and outcomes and then collect different perspectives from stakeholders to decide collectively on the best methodological approach (Gooden 2014).

## Government's Role in Resolving and Contributing to Inequity

The consequences of social equity can prove too great to ignore, providing a case for government interference. Over the course of history, several landmark policy and judicial decisions have helped shape the role of government in addressing social inequities. The cultural context of the 1960s that inspired the first Minnowbrook Conference also ushered in landmark decisions and policies such as the Civil Rights Act of 1964, which prohibited discrimination based on race, color, religion, sex, or national origin, and Kennedy's Executive Order 10925, establishing affirmative action in government employers (Gooden 2014). A decade earlier, courts recognized that racial segregation in schools created disparate access to high-quality education and resources, resulting in the 1954 *Brown v. Board of Education* ruling for integration of public schools (Gooden 2014). At the same time, concerns were raised citing unequal access among low-income children to education, nutrition, and health services during the critical period of early cognitive development, providing support for the federal Head Start program (Johnson and Svara 2011). These government actions provide only a small sample of overall examples of possible government approaches to promoting equity in institutions, programs, and the legal system.

While the government may play a powerful role in ameliorating inequalities and injustices, administrators must also be cautioned that such policies can unintentionally create disparate impacts for difference groups. This possibility of state-caused inequities should always be considered during the policy consideration and assessment processes. As an example, the "war on drugs" declared by President Nixon in the 1970s established a set of drug abuse and incarceration policies that today cost the government more than $51 billion annually and accounted for more than 1.5 million arrests in 2014 (Drug Policy Alliance 2015). Despite research suggesting that blacks and whites use drugs at almost exactly the same rates, American prisons admit African Americans at a rate 13.4 times greater than whites, and in some states blacks make up as much as 90% of drug prisoners (Boyd 2011). When blacks are arrested and sentenced at higher rates than whites for the same drug-related offense, the long-term effects of this incarceration – economic impacts

from lost job opportunities, political disenfranchisement as felons – are also disproportionately distributed by race (Brunet 2011). The disparate impact of punitive drug policies for African American men has become so severe that the American Civil Liberties Union refers to drug war policies as "the new Jim Crow" (Boyd 2011).

State-caused inequities may also be observed in the realm of education policy. Despite the *Brown v. Board of Education* case integrating public schools and theoretically restoring access, data suggests that disparities still exist in minority access and outcomes as related to education (Stiefel et al. 2011). Historically, schools are primarily funded through local tax revenue supplemented by state funding allocations. Based on this system, wealthy suburban schools generate higher tax revenues, while poorer communities may devote fewer resources and less money toward their schools (White 2015). Though state funding is intended to even out these differences, recent research by Mosenkis in Pennsylvania schools indicates that, while poor districts receive more state funding for education, districts with a higher proportion of white students receive substantially higher funding than schools with minority students at the same poverty level (White 2015). These disparities in funding and resources are reflected in unequal outcomes. On standardized tests, African American and Hispanic students score on average a full standard deviation below their white counterparts (Stiefel et al. 2011). It has been estimated that this performance disparity would be greatly reduced, by at least half, if minority children began kindergarten or first grade with equal levels of oral language, pre-mathematics, pre-reading, and general knowledge skills as white children; based on this research, it is evident that these inequities begin early, suggesting that federal programs like Head Start have not fully addressed the need (Farkas 2003). Furthermore, it has been suggested that black and white teachers tend to exhibit differences in evaluating behavior of students of different races; nonblack teachers demonstrate lower expectations for black students and are more likely to recommend harsh disciplinary action such as suspension for their black students (Gershenson 2015). This finding suggests that school districts could benefit from more extensive training requirements for teachers as well as broader public awareness of racial inequities.

Another example of state-caused inequities is provided by the American approach to health care. Unlike other countries, the United States does not guarantee universal care (Hug 2011). While emergency care is available for all, continuous access to affordable, preventative, regular health care is not guaranteed, and coverage and outcomes vary widely by race (Hug 2011). Minorities are more likely than whites to be uninsured or underinsured or to use the hospital as their usual source of care (National Healthcare Disparities Report 2007). These racial disparities are also observed in hospitalizations for controllable diseases like diabetes or asthma, which can be as four to five times higher for minorities than for whites (Hug 2011). Evidence suggests that the disparities in health indicators are even more starkly apparent in racially segregated residential areas, where resources are limited (Williams and Collins 2001).

## The Case for Improving Social Equity: Consequences of Inequities

Thus far, this chapter has reviewed means by which administrators may identify, measure, examine, and resolve possible social inequities and barriers within a society, whether naturally occurring or state caused. Yet, even if an inequity exists, the question remains why should administrators care? To what extent is it the responsibility of the government to interfere and mitigate inequities? Since America's founding, prioritizing the values of freedom, equality, and justice has presented a challenge, with the Constitution granting more weight to protecting freedom and liberty than equality (Johnson and Svara 2011). The inherent tension between these values has been at the center of many policy debates, particularly surrounding freedom of expression and freedom of economic pursuits. Placing these debates in the context of the "four pillars of public administration," equity may at times require compromising

on economy, efficiency, and effectiveness (Norman-Major 2012).

Despite the ideological tensions between liberty and equity and the debates against government interference, common arguments on behalf of social equity consistently emerge. Gooden (2014) describes organizational examinations of social equity as being catalyzed by four main triggers: moral, economic, political, and legal. A fifth additional argument for equity may be formed on the basis of the conflict and social unrest that occurs as a result of inequity (Wooldridge 2016). Though proponents of social equity may choose to emphasize certain arguments depending on the audience they are attempting to persuade, the full case for support of social equity is rich and multidimensional in nature (Norman-Major and Wooldridge 2011).

A primary argument for social equity centers around the morality of promoting what is "right" and "fair" (Hart 1974). As Rawls assumes as his first principle in the original position of society creation, "each person is to have an equal right to the most extensive system of equal basic liberties compatible with a similar system of liberty for all" (1974). Hart argues that all public administrators should adopt this principle with consensus to establish unified ethical guidelines by which to treat citizens – based not just on altruism but rather a sense of fraternity and human bond (Hart 1974). This view echoes that of John Locke, who believed that individuals are moral equals in nature (Frederickson 2005). If the moral stance states that all humans are entitled to this sense of fairness and equality in treatment and access, then it follows that barriers to such equality should be of moral concern (Frederickson 2005). As Frederickson summarizes, "persistent and grinding poverty is a profoundly moral issue, and social equity is a part of a moral stance on that issue" (2005). Moral arguments for social equity inspired civil rights legislation on the basis that mistreatment of citizens of different races was inherently "unfair" or "wrong" (Gooden 2014).

Throughout American history, the moral argument for equality led to creation of laws and principles to protect groups from mistreatment and discrimination. The legal argument for social equity, therefore, hinges on the responsibility of administrators and policy makers to enforce legislation and policy in keeping with previously established equity standards (Gooden 2014). For example, the American Civil Liberties Union (ACLU) and National Association for Advancement of Colored People (NAACP) have filed legal complaints to combat racial disparities, such as on behalf of welfare clients in Wisconsin who were sanctioned disproportionately by race (Gooden 2014). From this perspective, administrators should consider equity within policy to ensure that the impacts of services do not violate any existing legal protections.

As discussed above, many critics of equity-promoting policies cite interference with economic interests. Certainly, efforts to promote equity might challenge some economic freedoms, as demonstrated through tax redistribution policies, industry regulations, and environmental restrictions (Johnson and Svara 2011). Despite these apparent conflicts, social equity yields many economic net benefits (Norman-Major and Wooldridge 2011). Most notably, inequitable societies statistically demonstrate lower growth and economic performance than others (Buss and Ahmed 2011). Increases in poverty impede the ability of individuals to gain the education and skills necessary to contribute positively to the nation's workforce (Turner 2016). The Kellogg Foundation suggests that closing the earnings gap between white and minority incomes would improve US earnings by 12%, increasing GDP by $1.9 trillion and generating over $290 billion in additional tax revenue (Turner 2016). Similarly, poverty in communities is also associated with higher crime rates and worse health outcomes, further dampening economic productivity that could otherwise have generated goods and services for the economy (Holzer 2007). The net cost of poverty can become very high – in many cases, costing more money to fix the negative impacts than addressing the root inequities to begin with (Norman-Major and Wooldridge 2011).

Another cause of inequity is political in nature and thus must be part of any solution. Those with control over resources tend to exhibit the strongest

influence over public affairs. Bartels (2002) determined that voting behavior of senators reflected responsiveness to affluent constituents that was three times as great as to low-income constituents. This pattern was further solidified by the *Citizens United v. FEC* decision, in which the Supreme Court determined that campaign spending by non-profit corporations could not be limited due to freedom of speech (SCOTUSblog 2010). Imbalances in political power between groups violate the principle that government should be representative of its people (Gooden 2014). Furthermore, when individuals perceive themselves to have a lower rank in society, these feelings of low self-efficacy and unworthy of their place in society manifest in lower political participation, further damaging the political interests of the group (Kraus et al. 2015).

Related to the economic and political arguments for social equity but worthy of distinction, societies with high inequity tend to experience greater conflict (Wilkinson 2011). When feelings of injustice and exclusion pervade a culture, the community exhibits lower levels of trust, weaker community connections, lower quality of social relationships and cooperation, and feelings of disrespect between individuals – all of which may trigger violence and jeopardize economic and political stability (Wilkinson 2011). Indeed, areas with high Gini coefficients exhibit higher levels of violent crime. Buss and Ahmed (2011) assert that violence in these areas often has a "spill-over" effect into other developing areas, citing the example of regional conflicts in East Central Africa. In some cases, the conflict generated by inequity and poverty can worsen to extreme measures such as international and domestic terrorism. Burgoon (2006) argues that a country's government spending, which may help mitigate the political and economic barriers faced by the oppressed, is associated with a reduction in terrorist attacks and citizens perpetrating terrorism.

The frequency of observed conflicts in areas with high levels of inequity and poverty is no doubt fueled by the psychological and physical stress of the oppressed. Research has found a direct link between inequality in a society and negative psychosocial effects of toxic stress, depression, and psychotic symptoms (Piff and Wilkinson 2014). Furthermore, those in the lower end of the social hierarchy face challenges to access health-care services, leading to negative consequences for mental and physical health (Hug 2011). Research suggests that the impacts of poverty and inequity on the brain are not only psychological but also developmental and physiological.

Children from low-income households demonstrate distinct differences in cognitive abilities than their peers at a very young age, creating disparities in mental disorders, educational attainment, and IQ scores, which can lead to permanent setbacks in educational and economic outcomes (Sleek 2015). Despite previous claims that a child's development is primarily shaped by family structure, the primary factor negatively affecting cognitive development is long-term poverty (Nuffield Foundation 2011). Furthermore, if children have developed in an environment surrounded by violence and unrest, MRI scans show weak neural connections and development in parts of the brain controlling judgment, awareness, ethics, and emotions (Hayasaki 2016). Lower levels of the brain tissue called gray matter in specific areas like the hippocampus impeded the children's ability to follow instructions and devote attention to learning, resulting in lower standardized test scores (Hayasaki 2016). This stunted brain growth is a direct biological response to an environment full of toxic stress – a type of sustained fight or flight – and suggests that the cyclical effects of poverty begin much earlier than scientists may have thought and that current programs promoting early child care and access to resources should also direct substantial resources to protecting children's socio-emotional development.

## Future of Social Equity

As demonstrated by examples of state-caused and state-remedied social inequities, the relationship between government and equality, while politically complicated, is inextricably linked. Due to

the potential for serious negative consequences of inequality within a society, the government should care, and indeed must care, about the promotion of equity from many perspectives, including political, economic, legal, moral, and conflict management arguments. Even as the current political approach champions a trend toward privatization to provide services (Ravitch 2016), how can administrators continue to promote accountability and commitment to equity of access, quality, and outcomes for all citizens?

The question that lies before us is broad, but several concrete tactics may be used to advance equity for the future of public administration. First, administrators themselves must be educated and trained on the topic of equity in order to analyze systems and policies for disparate impacts and barriers to access and to seek alternative policy options. The curriculum within public administration programs should underscore the importance of examining issues of public administration and policy using an equity framework, examining equity from the perspectives of access, quality, procedural fairness, and outcomes (Larson et al. 2016). In conjunction with providing education to incoming administrators, current elected officials and staff may be provided with training and development opportunities regarding the importance of equity considerations and concrete tools to inform policy decisions (Johnson and Svara 2011).

While awareness and education provide a solid foundation for examining equity issues, it is necessary to extend these efforts a step further to increase understanding of specific tools and measures that can be used to assess equity. Much progress has been made in this area in recent years. The social equity framework has helped create the demand to identify, define, and collect data sources where information was previously unavailable. Svara suggests administrators may utilize the questions posed by the social equity framework and the resulting data to conduct an "equity inventory" at different levels of government, from the operations and services of a small department to a more jurisdictional level reviewing results across departments. Some exemplary jurisdictions have already created equity "toolkits" or "scorecards" to serve as helpful templates to assess performance and proposals – for example, the Seattle Racial Equity Toolkit (Johnson and Svara 2011) or the King County Office of Equity and Social Justice's "list of determinants of social equity" (Larson et al. 2016). In addition to expanding upon the foundation provided by these examples, administrators may also enhance measurement tools by seeking help from researchers and economists to reduce measurement and evaluation challenges such as inadequate or decentralized data, poor measurement tools and methodology, and nervousness and hesitation about evaluation among leadership.

Once administrators have the knowledge to seek out these possible inequities and identify them, the next critical step is generating broad public exposure and attention surrounding inequity's negative consequences. The political, economic, and moral dangers of inequity within a society should raise concern among public officials and individual citizens alike. Through collaboration with the media, public statements, reports to officials, and other actions, administrators can demonstrate their commitment to equity and continuously raise awareness regarding the impacts of inequity, ultimately giving stakeholders the knowledge and tools to normalize attention to equity issues and embed equity within policy considerations.

# Social Exclusion and Vulnerability in Crisis

John J. Kiefer
University of New Orleans, New Orleans, LA, USA

## Synonyms

Disasters; Hurricane Katrina; Social exculusion; Social vulnerability

## Definition

Social Vulnerability: The inability of people, organizations, and societies to withstand adverse impacts from multiple stressors to which they are exposed.

Disaster management has long been an essential role of the government. The US Constitution tasks states with the responsibility of public health and safety. Nonprofit organizations such as the Red Cross fulfill important emergency management roles as well, as does the faith-based community and the private sector. Initially, disaster planning research focused on infrastructure vulnerabilities, often neglecting some population groups. Yet scholars and emergency managers now recognize that in order to promote resilient and more adaptive societies, a better understanding of social vulnerability and subsequent vulnerability reduction is needed.

Vulnerable social groups are considered to be at risk due to poverty, physical disabilities, ethnicity, age, or substance abuse problems. Social exclusion, sometimes referred to as social marginalization, is defined as the social disadvantage to those individuals and communities who are often systematically blocked or denied rights, opportunities, and resources normally available to other groups. The rights can include rights to housing, employment, healthcare, and due process – all fundamental rights integral to the society (Silver 1994).

## What Is "Vulnerability?"

The definitions of social exclusion and vulnerability provide a complex, multidimensional delineation that can include many varying factors. Vulnerability can be described as the "characteristics of a person or a group and their situation that affect their capacity to anticipate, cope with, resist and recover from the impact of a natural or manmade hazard, defined as an extreme natural event or process" (Wisner et al. 2003). More broadly, vulnerability has been defined as a combination of factors that influence the extent to which livelihood, property, and other assets are at risk as a result of a discrete and identifiable event in nature or society. It has been argued that vulnerability is a term that is used to "describe

S

different factors that may adversely affect people's capacity to deal with the specific disaster." These factors include, but are not limited to, such characteristics as gender, age, disability, health status, and other contextual life stressors. These stressors can ultimately affect vulnerability and shape people's ability to cope with and survive in a disaster.

Physical vulnerabilities are a result of biological changes. The three major types include human, agricultural, and structural vulnerabilities. Human susceptibilities include vulnerability due to environmental extremes such as temperature, water pressure, and chemical exposures that can ultimately lead to death, injury, and/or illness. Agricultural vulnerability on the other hand refers to plants and animals. As with humans, animals can be exposed to extreme temperature, pressure, chemical and infectious agents. FEMA recognizes that agricultural vulnerability is more complex than human vulnerability.

## Social Exclusion

Those who are most vulnerable are also the ones who are often socially excluded from society. As early as 1963, a study found that a disproportionate number of African Americans died in Hurricane Audrey, which struck the US Gulf Coast on June 25, 1957. The study revealed that the death rate was 38 per thousand of the white population and a striking 322 per thousand for blacks.

Steven Koven argues in "Image Construction in the Wake of Hurricane Katrina" that:

> In the case of Hurricane Katrina various actors presented images that would ultimately shape citizen realities. The establishment of this reality in turn has significant consequences in regard to money, reputation, and professional careers. Viewed in this context, Katrina was much more than a devastating natural disaster but represented a professional disaster for some and moderate success for others. It can be viewed as an opportunity to view government agents in action, the media in a feeding frenzy, and the posturing of politicians. The action and interaction of each of these actors helped to create Katrina's enduring images. (Koven 2014, p. 333)

The images from Hurricane Katrina are seared into the nation's collective memory. The Brookings Institute concluded that 2005 New Orleans (prior to Katrina) had the second-highest rate of poor residents living in neighborhoods of extreme poverty. (In 2005 New Orleans ranked second, behind Fresno, California. "Extreme poverty" is defined as a situation where more than 40% of individuals had incomes below the poverty line). Still, Hurricane Katrina was not the first storm that the city had experienced. During Hurricane Betsy in 1965, the predominantly African American and working class neighborhoods, including the Lower 9th Ward, were catastrophically flooded when the levees at the Industrial canal breached. Again in 2005 the levees breached in four separate places, flooding the city, trapping tens of thousands of residents. (There were two breaches on the East side of the Industrial Canal – between North Galvez and North Roman Streets and at Florida Avenue flooding the lower 9th Ward. Two breaches on the west side of the Industrial Canal near France Road. Two Breaches on the London Avenue Canal, one close to Mirabeau Avenue and Warrington Drive and the other near Robert E. Lee Boulevard and Pratt Drive. These two breaches flooded parts of the west side of the Industrial canal through the Gentilly neighborhood. The final breach occurred at the 17th Street Canal near Belaire Drive between Stafford Place and 40th Street – flooding Lakeview, Mid City, Old Metairie, Jefferson, and parts of Uptown.)

And race was not the only vulnerability when Hurricane Katrina struck. Older people were among those who fared the worst. People aged 65 and older had higher rates of mortlity from this event than did any other age group. And yet the story of older people is one of the most underreported and least understood narratives of the storm (Gullette 2006; Sharkey 2007). Older people perished from drowning and from exposure, heat and dehydration. In the aftermath, many of those who were evacuated suffered life-threatening or deadly events.

In the end, the media coverage of the devastation wrought from Hurricane Katrina clearly demonstrated poignant examples of social exclusion

and vulnerability. These vulnerable populations could no longer be ignored. As Betty Morrow points out, vulnerability is often socially constructed and arises out of social and economic circumstances present in everyday life.

## The Consequences of Social Exclusion

As early as the 1950s, cultural anthropologists examined the social consequences of natural disasters in order "to search for cross-site invariances in disaster-related behaviors, and to codify these findings" (Torry et al. 1979, p. 518). Centered on natural disasters only, the studies included drought, hurricanes, volcanic threats, and flooding. It was concluded that disaster vulnerability is "engraved in routine events" and locational choices that place communities in the path of hazard agents.

The social consequences of disaster can be viewed in terms of people's ability to anticipate, cope with, resist, and recover from the effects of natural hazards. As with physical susceptibilities, social vulnerabilities have been categorized into psychosocial, demographic, economic, and political impacts. The experience of a disaster can cause a wide range of negative psychological effects such as fatigue, emotional signs of anxiety and depression, tics, confusion, impaired concentration, and attention deficit. These damaging psychological impacts have been labeled "emotion focused coping," where a portion of the population experiences a disruption in their social functioning. Vulnerable groups such as children, the elderly, and people with preexisting mental illness often need to be treated through crisis counseling after an event.

Other social impacts are economic. These can include the property damage caused by disasters that create losses in value. Although value can be measured by the direct cost of repair or replacement, these losses are difficult to determine because there is no single organization that tracks the data necessary to compute these values. Indirect costs, which arise from the interdependence of community subunits, are also included in social disaster impact research.

Evidence has shown that the political impacts of disaster often lead to social activism and political disruption especially "during the seemingly interminable period of disaster recovery" (FEMA 2008, p. 162). Generally, victims of disaster try to recreate their predisaster housing patterns. But these situations can often become problematic for their neighbors. Instances include victims of a hurricane attempting to site mobile homes on their lots or in designated zones in other municipalities while awaiting reconstruction of permanent housing; conflicts arise because such housing usually is considered a blight on the community; neighbors are afraid the "temporary" housing will become permanent, or will, even temporarily, shelter "undesirable" people.

## New Technologies for Identifying Community Vulnerability

New technologies may be helpful in identifying community vulnerability. In 2000, the social vulnerability index, or SVI, was created by the Agency for Toxic Substances and Disease Registry. The SVI shows "the resilience of communities when confronted by external stress on human health, stresses such as natural or human-caused disasters, or disease outbreaks" (Agency for Toxic Substances and Disease Registry 2013). Using Geospatial Research, Analysis & Services Programs (GRASP), the SVI was created to help emergency response planners and public health officials identify communities that would most likely need support before, during, and after a hazardous event. (GRASP provides leadership and expertise in concepts, methods, and tools of geospatial information science to public health research and practice in collaboration with scientists, public health partners, and researchers at the Center for Disease Control and the Agency for Toxic Substances and Disease Registry. This program is used to address environmental health and emergency preparedness using the promotion of geospatial technology (Agency for Toxic Substances and Disease Registry 2013).) Variables and descriptions have been updated from 2000 to 2010 to encompass a variety of social

**Social Exclusion and Vulnerability in Crisis, Table 1** Thirty-two original SoVI® variables and descriptions used in SoVI® 2000

| Variable | Description |
|---|---|
| QASIAN | Percent Asian |
| QBLACK | Percent black |
| QSPANISH | Percent Hispanic |
| QINDIAN | Percent Native American |
| QKIDS | Percent kids |
| QPOP65O | Percent of population over 65 |
| MEDAGE | Median age |
| QSSBEN | Percent social security beneficiaries |
| QPOVTY | Percent poverty |
| QRICH | Percent of households earning over $100,000 annually |
| PERCAP | Per capita income |
| QMIGRA | Percent of foreign born who are recent migrants |
| QFEMALE | Percent female |
| QFHH | Percent female headed households |
| NRRESPC | Nursing home residents per capita |
| HOSPTPC | Hospitals per capita |
| PHYSICN | Number of physicians per 10,000 people |
| QED12LES | Percent with less than 12th grade education |
| QCVLBR | Percent in civilian labor force |
| QCVLUN | Percent civilian unemployment |
| QURBAN | Percent urban population |
| QRFRM | Percent of population on rural farms |
| PPUNIT | People per unit |
| QRENTER | Percent renters |
| HODENT | Housing density |
| MHSEVL | Mean housing value |
| MCRENT | Mean contract rent |
| QMOHO | Percent mobile homes |
| QAGRI | Percent employment in extractive industries |
| QSERV | Percent employment in service industry |
| QTRAN | Percent employment in transportation and public utilities |
| QFEMLBR | Percent female participation in labor force |

vulnerability indicators as shown below (Tables 1, 2, and 3 represented here were taken directly from the Hazards & Vulnerability Research Institute website. http://webra.cas.sc.edu/hvri/products/sovi_details_2006.aspx.):

**Social Exclusion and Vulnerability in Crisis, Table 2** List of modifications and omissions to existing SoVI® 2000 variables in SoVI® 2006–2010

| Variable | Modifications |
|---|---|
| QSPANISH | Renamed QHISP |
| QINDIAN | Renamed QNATAM |
| QKIDS | Omitted and replaced by QAGEDEP |
| QPOP65O | Omitted and replaced by QAGEDEP |
| QSSBEN | Percent of households receiving social security beneficiaries (formerly individuals) |
| QRICH | Percent of households earning over $200,000 annually (formerly $100,000) |
| QMIGRA | Omitted and replaced with QESL |
| NRRESPC | Modified to percent of population living in nursing and skilled-nursing facilities (formerly computed per capita) |
| HOSPTPC | Omitted at block group and tract levels |
| PHYSICN | Omitted |
| QCVLBR | Omitted |
| QURBAN | Modified census definition (county, tract levels only) |
| QRFRM | Omitted |
| HODENT | Replaced by POPDENS |
| MHSEVL | Omitted and replaced by MDHSEVAL |
| MCRENT | Omitted and replaced by MDGRENT |
| QAGRI | Renamed QEXTRCT |
| QTRAN | Omitted |

Shortly after its development, the SVI was added to FEMA's HAZUS 1.4 software, released in 2009. With this addition, HAZUS-MH 1.4 added more social elements, such as the estimate of shelter requirements and the number of displaced households included in the risk assessment outcome. Other variations of the SVI are being studied to determine their suitability for serving as tools throughout the disaster cycle from mitigation and preparedness through response and recovery phases.

To better address social exclusion and vulnerability in crises, emergency planners must be able to identify the locations of their vulnerable populations. Vulnerability maps serve as effective tools for planners and managers in understanding how unique social groups may be at risk. Vulnerability maps serve as a way to pinpoint where high-risk groups may be concentrated. As a result

**Social Exclusion and Vulnerability in Crisis, Table 3** List of twenty-nine SoVI® 2006–2010 variables with descriptions

| Variable | Description |
|---|---|
| QASIAN | Percent Asian |
| QBLACK | Percent black |
| QHISP | Percent Hispanic |
| QNATAM | Percent Native American |
| QAGEDEP† | Percent of population under 5 years or 65 and over |
| QFAM† | Percent of children living in married couple families |
| MEDAGE | Median age |
| QSSBEN | Percent of households receiving social security |
| QPOVTY | Percent poverty |
| QRICH200K | Percent of households earning greater than $200,000 annually |
| PERCAP | Per capita income |
| QESL† | Percent speaking English as a second language with limited English proficiency |
| QFEMALE | Percent female |
| QFHH | Percent female headed households |
| QNRRES | Percent of population living in nursing and skilled-nursing facilities |
| HOSPTPC | Hospitals per capita (county level ONLY) |
| QNOHLTH† | Percent of population without health insurance (county level ONLY) |
| QED12LES | Percent with less than 12th grade education |
| QCVLUN | Percent civilian unemployment |
| PPUNIT | People per unit |
| QRENTER | Percent renters |
| MDHSEVAL† | Median house value |
| MDGRENT† | Median gross rent |
| QMOHO | Percent mobile homes |
| QEXTRCT | Percent employment in extractive industries |
| QSERV | Percent employment in service industry |
| QFEMLBR | Percent female participation in labor force |
| QNOAUTO† | Percent of housing units with no car |
| QUNOCCHU | Percent unoccupied housing units |

Daggers (†) notate new variables in SoVI® 2006–2010
Note: QSPNEEDS (Percent of population with a disability) was included in SoVI® 2005–2009 but excluded from SoVI® 2006–2010 because estimates were not available for all counties

of their use, first responders and emergency managers can make better-informed estimates about community need during a crisis response.

## Conclusion

There is no doubt that certain groups are highly vulnerable to a disaster. In mitigating and planning for emergencies, federal, state, and local authorities must identify physically and socially vulnerable communities to better-provide those residents increased and tailored assistance throughout a disaster. Emergency managers must know their communities. This means knowing where those with physical disabilities are, where those without transportation are located, where those with linguistic differences live, and identifying the many other groups who may be disparately impacted by disaster so that humane and effective strategies can be implemented. Hurricane Katrina certainly demonstrated that emergency management plans need to be living, breathing, working, flexible documents and must pay special attention to those who may bear the highest burden.

## Social Impact

Gianluca Antonucci and Michelina Venditti
DEA – G. d'Annunzio University of Chieti-Pescara, Chieti-Pescara, Italy

### Synonyms

Nonfinancial performance; Social change; Social innovation; Social value

### Definition

Social impact provides evidence that an organization's activity leads to a real and tangible benefit to other people, the community, or the environment.

### Introduction

In its broad definition, social impact aims at measuring the consequences of a human activity in the context in which it is designed, developed, and implemented. The origin of the concept may be dated back to the end of the 1960s, when some agencies and organizations started to analyze the consequences that large scale interventions, like main infrastructures or plants, had or might have on the equilibrium of the environment.

In terms of the work of nonprofit organizations, social impact is a relatively new concept, descending from the fact that, over the last decades, its definition moved toward a concept regarding the search for tools for planning projects and evaluating initiatives and actions which have important positive impacts on people's lives, communities, countries, or society in general. Therefore today social impact deals with the definition of tools and instruments for demonstrating and accounting the impact of social programs and projects developed by nonprofit organizations with respect to their institutional social mission and mission-related goals. Nowadays the real challenge regarding social impact is the search, by nonprofit organizations, for valid tools and techniques for social impact assessment, measurement, and communication, both at an ex ante level in planning new projects, initiatives, and so on and at an ex post level, when it is necessary to demonstrate and "account" that the socially responsible planned action has given the expected results in terms of positive impacts upon the target and/or in general on people's well-being.

Considering all the abovementioned aspects, this entry is sectioned in three parts. The first one describes the origin of the concept of social impact and the initial development of social impact assessment as set of tools for evaluating the consequences (positive and/or negative) of human projects/actions in a specific context or toward a specific target. The second one describes the "shift," occurred since the 1980s, that the concept of social impact had from the evaluation of a project to the evaluation of socially committed organizations – being the major of them constituted by new typologies of nonprofit organizations like social economy organizations, social enterprises, and civil society organizations – in achieving their institutional aims. In particular in this section are described (1) the difference in measuring output (what has been produced) and outcome (the impact consequent to the production of the output) and (2) the definition of the Social Return on Investment as a valid tool for measuring the "added value" of "investments" (in the broad sense of the term from simple donations to complex philanthropic initiatives) in social activities. The third section underlines the strict relation between the necessity of measuring the results achieved by a nonprofit organization, showing outcome, and the achieved impact through proper

indicators, illustrating as these organizations need Social Accounting principles in order to account the achievement of their mission.

## The Origin: Social Impact

The first one to use the locution social impact was Donald Campbell (1957) who used it, from 1957 onward, in his works regarding the themes about validity of actions in the field of social science experiments. But a part from its relevance in the field of social science methodology, Campbell's heritage, in the definition of social impact, refers to the fact that, for the first time, it was stated that it is important to note the effects caused by an exogenous introduction of a disruption into a system, in terms of the changes it produces in the system itself.

It has been also observed that the roots of social impact may lie in researches carried out since the 1950s by anthropologists and sociologists who feared that proposed developments might have serious negative side effects (Barrow 2000). In this sense social impact can be seen as the effects, or consequences, of an action that intentionally or unintentionally changes the status quo of a complex system.

The arguably "first" definition of social impact, at a mandatory level, that is in a proper definition in a law specifically aimed at accounting for social impact, can be found in the formal requirements of the 1969 National Environmental Policy Act (NEPA) enacted in the United States, which declared a national policy to encourage productive and enjoyable harmony between man and his environment, promoting efforts to prevent or eliminate damages to the environment and biosphere and stimulate the health and welfare of man.

Indeed, although Burdge and Vanclay (1995) argued that the consideration of social impacts existed long before NEPA, it is also true that social impact assessment (SIA), "formalized in terms of legal requirements and/or as part of normal project planning, is linked to the spread of NEPA-like legislation and thinking around the world" (Esteves et al. 2012, p. 34). Since the mid-1970s, an increasing number of academic articles and professional guidelines have been published with the aim of clearly defining and coding SIA. By the analysis of them (Esteves et al. 2012) enucleated the following aims of SIA:

- Creating participatory processes and deliberative spaces to facilitate community discussions about desired futures, the acceptability of likely impacts and proposed benefits, and community input into the SIA process, so that there can be a negotiated agreement with a developer based on free, prior, and informed consent
- Gaining a good understanding (i.e., profiling) of the communities likely to be affected by the policy, program, plan, or project including a thorough stakeholder analysis to understand the differing needs and interests of the various sections of those communities
- Identifying community needs and aspirations
- Scoping the key social issues (the significant negative impacts as well as the opportunities for creating benefits)
- Collecting baseline data
- Forecasting the social changes that may result from the policy, program, plan, or project
- Establishing the significance of the predicted changes and determining how the various affected groups and communities will likely respond
- Examining other options
- Identifying ways of mitigating potential impacts and maximizing positive opportunities
- Developing a monitoring plan to inform the management of change
- Facilitating an agreement-making process between the communities and the developer ensuring that principles of free, prior, and informed consent (FPIC) are observed and that human rights are respected, leading to the drafting of an impact and benefit agreement (IBA)
- Assisting the proponent in the drafting of a social impact management plan (SIMP) that puts into operation all benefits, mitigation measures, monitoring arrangements, and governance arrangements that were agreed to in the

IBA, as well as plans for dealing with any ongoing unanticipated issues as they arise
– Putting processes in place to enable proponents, government authorities, and civil society stakeholders to implement arrangements implied in the SIMP and IBA and to develop their own respective management action plans and embed them in their own organizations, establish respective roles and responsibilities throughout the implementation of those action plans, and maintain an ongoing role in monitoring (Esteves et al. 2012, p. 35)

According to the abovementioned definitions and classifications, it is important to note that, over the decades, from the initial definition given in NEPA in 1969, until nowadays, SIA became not anymore a regulation to be respected but a real "discipline," aiming at improving project planning development and implementation, especially for what concerned the well-being of affected people (Vanclay 2014). In this sense SIA enlarged its field. Indeed, starting from the analysis of impacts on population, employment, housing, etc., the range of social and economic variables, analyzed through SIA, has expanded over the years, paying attention also to other aspects, such as contexts of indigenous populations, forced resettlement, impacts on physical and psychological health and well-being, and so on having in this way a "new" consideration of long-term impacts related to community sustainability.

## The "Shift" from Project Planning to Impact Evaluation of Socially Responsible Organizations, Mainly Constituted by Nonprofit Organizations

### The World Bank Definition About the Relevance of Measuring Outputs and Outcomes of a Project

From its initial consideration about negative impacts as consequences of infrastructures, plans, and projects, first on the environment and then on social communities, social impact evaluation started to be considered as a useful tool for the definition of projects in developing countries.

The first important input in this sense was given by the analysis run by the World Bank, which stated that project evaluation could help in the selection and design of future projects financing activities run by nonprofit organizations in developing countries. Thus impact evaluation was seen as a tool to estimate the "net impacts of a project on the target population, by comparing the conditions of the affected groups after the project has taken place with what they would have been without the project" (World Bank 1987, p. 5). In this sense World Bank could choose to finance the best social initiative among different ones proposed by different nonprofit organizations.

In defining tools for estimating the goal achievement of financed social initiatives, the World Bank underlined a main difference in analyzing a project in terms of social impact. In fact it stated that a project can be evaluated by considering both internal and external efficiency and validity.

The former, having a specific focus on the project *outputs*, assesses project activities by considering, first of all, the correspondence of the delivering and using of the assigned resources with the approved aims and timing stated in the planned project, paying attention to cost-effectiveness relationship.

The latter, having a specific focus on the project *outcomes*, assesses the achievement of intended impacts, providing feedbacks on aspects such as the extent of achieved goals, the level of accessibility by the target population, and the efficiency in the implementation of the different project aspects. In synthesis it evaluates the proficiency of the project in achieving its objectives.

In defining social impact in terms of achieved results, World Bank outlined three main dimensions for the impact assessment in terms of outcomes (World Bank 2003):

– *Social inclusion*, seen as the removal of institutional barriers and the enhancement of

incentives to increase the access of diverse individuals and groups to development opportunities. In this sense the considered variables might be:
- Access to public goods and services generated by the project
- Access to market opportunities created by the project
- Access to information
- *Empowerment*, seen as the enhancement of assets and capabilities of diverse individuals and groups to function, and to engage, influence and/or hold accountable the institutions that affect them. In this sense the considered variables might be:
- Enhancement of physical or financial assets
- Strengthening of capabilities in the form of human or social capital
- Increased voice and participation in the project
- Increased transparency and accountability
- *Security*, which encompasses improved management of the social risks arising out of development interventions. In this sense there might be considered variables such as:
- Mitigating the adverse impacts of resettlement
- Security of property
- Rule of law
- Addressing social tensions and conflict
- Increased social cohesion/social reintegration (World Bank 2003, p. 2)

World Bank indications laid the basis for the necessity to identify tools to measure both outputs and outcomes in the development of any project/initiative aimed at improving the conditions of a target population. Thanks to the inputs given by the World Bank, together with the large increase in the number of nonprofit organizations, as well as the diffusion of different concepts and indications regarding socially committed firms and initiatives, the issue of social impact has gradually evolved opening a "new field" aiming at looking for measures to ensure that a socially committed organization achieves its mission by implementing activities that lead to a real and tangible benefit to other people, a community, or the environment.

## Social Return on Investment (SROI) as a Tool for Measuring and Account Social Impact Achieved by New Typologies of Nonprofit Organizations

A turning point in seeking for measures to ensure that a nonprofit organization has achieved its mission in the best possible way, by implementing activities that lead to a real and tangible benefit to other people, a community, or the environment, can be found in the definition and classification of the Social Return on Investment (SROI). Although the issue of seeking measures to demonstrate the goal achievement by nonprofit organizations started to be investigated by the end of the 1980s, it was not easy to find a tool able to put together aspects like the measuring of the impact and the necessity to account the validity, in terms of efficiency and effectiveness, of the path followed to achieve the goal. An important milestone in this path was achieved in 1996 with the publication of "New Social Entrepreneurs: The Success, Lessons, and Challenge of Non-Profit Enterprise Creation" by the Roberts Enterprise Development Fund (REDF), which, from 1997 to 1998, applied its new method to 23 social enterprises (that is the "new frontier" of nonprofit organizations. See the entry "Definition of Nonprofit Organizations") owned and operated by seven nonprofit organizations in the San Francisco area. REDF then launched the SROI Project from 1998 to 2000, which concluded with the release of the first REDF Portfolio Report, and shared all the findings in specific templates and detailed examples.

Although in the last decade REDF rethought its SROI definition through the implementation of the Good Ship SROI (Javits 2008) arriving, in 2015, at the publication of the report on economic self-sufficiency and life stability (Rotz et al. 2015), there is no doubt that SROI thinking and methodology changed the way of thinking and acting of both nonprofit organizations managers and stakeholders, thanks to the definition and implementation of a method for measuring nonprofit organizations' impact through the use of specific accountability tools.

The demonstration of achieved results, through accountability tools, still represents an important

current issue for nonprofit organizations which – as it will be explained in the next section of this entry – 'compete' one against the other in increasing both fund-raising and people-raising through proper information reports for their stakeholders. Indeed since the end of the 1970s, in the field of nonprofit – thanks to the great development of the new typologies of nonprofit organizations (like social economy organizations, social cooperatives, social enterprises. See the entry "Definition of Nonprofit Organizations") which were much more oriented than old ones (like charities, philanthropic organizations, voluntary organizations. See the entry "Definition of Nonprofit Organizations") toward efficiency and effectiveness – there has been an always greater interest in finding proper tools for the accountability of the results achieved by these organizations. Indeed also if nonprofit organizations have always been accountable, about their mission, toward their stakeholders, the great development of the new typologies of nonprofit organizations led to an increase in accountability demands having funders, donors, and other stakeholders expecting measureable evidences of impact with respect to the mission.

Therefore all interested stakeholders started to demand, beyond operational accountability, also a proper reporting about the impacts achieved by the nonprofit organization to which they gave funds. In synthesis stakeholders asked nonprofit organizations to give evidence, through specific tools, about the social return of the used giving they received, being thus able to document the added value, in terms of impact, of an investment made in philanthropic activities.

The fundamental premises for SROI were "First, that a philanthropic dollar invested in the social mission of a nonprofit today generates future economic and social returns in excess of the initial value of that dollar; and Second, that social purpose enterprises – and many tax-exempt, nonprofit organizations – are creating significant value for society which goes largely undocumented and is vastly under-appreciated" (Emerson et al. 2000, p. 135).

In this sense the consideration is that, the value creation, for these organizations, can be analyzed in three subsequent units of measure, ranging from purely Economic, to Socio-Economic, to Social (Emerson et al. 2000).

The first is the result given measuring the difference in value between used inputs and generated outputs and can be measured by the difference in values expressed by the market.

There is a Social Value when the combination of resources, inputs, processes, or policies generates progresses in the lives of individuals or society as a whole. It can be considered as the essence of most nonprofit activities, but it is also the most difficult value to be measured because in most cases (for instance, advocacy activities, anti-discrimination activities, empowerment activities), it is difficult to agree upon or quantify its intrinsic value.

Socio-Economic Value starts from Economic Value principles trying to use the same logic also for measuring and give accounts about elements concerning social value. An organization achieves Socio-Economic Value when, through its activity, it both can increase the value of the used inputs and can also generate benefits for the public system or environment. In this sense "The core SROI analysis, as presented by REDF, does not attempt to definitively quantify and capture all aspects of the benefits and value that accrue as a result of a successful program, but rather to identify direct, demonstrable cost savings or revenue contributions that result from that intervention. And, with that documentation in place, an SROI analysis argues that the non-profit should be at least partially compensated and/or credited for the value it creates in the market place" (Emerson et al. 2000, p. 138).

An SROI analysis, as conceived by REDF:

- "examines a social service activity over a given time frame (usually 5–10 years);
- calculates the amount of "investment" required to support that activity and analyses the capital structure of the non-profit that is in place to support that activity;
- identifies the various cost savings, reductions in spending and related benefits that accrue as a result of that social service activity;

– monetizes those cost savings and related benefits (that is to say, calculates the economic value of those costs in real dollar terms);
– discounts those savings back to the beginning of the investment timeframe (referred to as "Time Zero") using a net present value and/or discounted cash flow analysis; and then
– presents the Socio-Economic Value created during the investment time frame, expressing that value in terms of net present value and Social Return on Investment rates and ratios" (Emerson et al. 2000, p. 139).

The REDF model was constructed upon a "blended value" model where organizations could both achieve economic success and maximize social benefits. It is indeed a framework able to assess and report about a comprehensive idea of value greater than the "simple" economic one considering social, environmental, and economic costs and benefits.

In some sense the SROI has "closed the loop" for the definition of social impact for nonprofit organizations in that, besides the already defined aspects of the measurement of output (what has been done/produced) and outcome (the relevance/consequence of the output in a system), it has added the measuring of the impact, as an added value, that is the extent – being able to define also a value for money measure – of what the benefit of an action/project/initiative has been compared to what it would have been if the pre-existent status quo had remained.

## Current Issues in Social Impact Assessment and Measurement for Nonprofit Organizations

The last decades saw a great increase both in the number and in the different typologies of nonprofit organizations (see the entry "Definition of Nonprofit Organizations"); nowadays nonprofit organizations deal with a lot of different issues having very different aims, from the help to disadvantaged people to the protection of the environment, passing through advocacy initiatives. This led to a situation in which different nonprofit organizations, in a certain sense, "compete" against each other to increase both fund-raising (donations) and people-raising (voluntary workers) as well as legitimacy both toward the public system and – although to a relatively lesser extent – the market. The demonstration and accountability of social impact is thus becoming increasingly important.

Moreover, since the beginning of the 1990s, the idea of social commitment has also "spread" increasingly among for-profit companies, which have started showing their stakeholders that their activities are run taking into appropriate account the consequences of these and their deriving social impact. The measurement of social impact through reliable tools and techniques has thus become a key issue since the early 2000s.

In the second part of the previous section, it has been showed, although now modified also by REDF, SROI represented a milestone in the development of tools for measuring and accounting the social impact achieved by initiatives and projects run by nonprofit organizations. During the last decade, following the principles at the base of the development of SROI, other methods have been shaped underlying different aspects in developing a tool for measuring and accounting social impact. In this last section, there will be presented the principal statements of two recent method catalogues aiming at analyzing the different widespread techniques trying to enucleate the principal elements and steps for a sound social impact evaluation and reporting.

Considering this copresence of methods, the Rockefeller Foundation's ProVenEx fund launched the "Double Bottom Line Project" (DBLP) with the aim of providing both donors and organizations in having a comprehensive method to estimate and account the social impacts of the implemented activities. The DBLP led to the publication, in 2004, of a method catalogue (Clark et al. 2004) which represents a first important analysis of different widespread techniques. In fact the authors outlined how, despite the increasing interest in more tangible accountability for social impact, there was not yet any comparable standard as in financial reporting systems. Starting from the consideration that there were

and are, however, several entrepreneurs and stakeholders interested in measuring and reporting about achieved social impacts, the authors conducted in-depth interviews with funders aiming to document, define, and report on the nonfinancial performance of their activities, thus creating a method catalogue based on concrete experiences. In particular, the DBLP catalogue analyzed and assessed the following used methods and techniques for social impact measurement and accountability: Theories of Change, Balanced Scorecard (BSc), Acumen Scorecard, Social Return Assessment, AtKisson Compass Assessment for Investors, Ongoing Assessment of Social Impacts (OASIS), Social Return on Investment (SROI), Benefit-Cost Analysis, and Poverty and Social Impact Analysis (PSIA).

The DBLP analyses combined definitions where possible and redefined some essential terms, thus developing the impact value chain (IVC). The IVC's usefulness as a method for different assessment problems can be evaluated according to two essential factors: (1) *feasibility*, the extent to which measurement tools are useful and applicable considering the context of the organization and the initiative to be run, and (2) *credibility* – the extent to which the approach is sufficiently rigorous and exhaustive to provide measures that are credible to relevant third parties. The IVC incorporates the following variable categories for the assessment of a social impact method evaluation:

- "*inputs*: the resources (money, staff time, capital assets, etc.) required to operate the venture or organization;
- *outputs*: indicators and other measurable variables from an organization's operations that management can directly measure;
- *outcomes*: specific changes in attitudes, behaviors, knowledge, skills, status, or level of functioning that result from enterprise activities, such as finding a job, avoiding getting sick, or reducing emissions by a certain amount;
- *impact*: the difference between the outcome for a sample exposed to an enterprise's activities and the outcome that would have occurred without the venture or organization.
- *goal alignment*: the management process of evaluating whether outcomes or impacts met desired goals and determining what can be done to improve operations" (Clark et al. 2004, p. 14).

The DBLP analysis defines also the *applicability to lifecycle stages*, which indicates the range of venture stages for which each analyzed method seems most appropriate.

Another important step forward in providing tools for a more tangible accountability for social impact, looking for comparable standards, is represented by the work done by The European Venture Philanthropy Association (EVPA), which, in the second annual EVPA survey of Venture Philanthropy and Social Investment in Europe released in 2013 (run collecting data on 61 Venture Philanthropy Organizations (VPOs), reinforced the importance of social impact measurement by underlining the following important findings:

- There is increased attention to measuring social impact.
- VPOs still focus on outputs more than outcomes or impact.
- There is still a lack of standardization, indicating a high degree of fragmentation in the use of impact measurement tools and systems.
- Impact measurement is not fully integrated into the decision-making process (Hehenberger and Harling 2013).

On the one hand, the results of this survey combined with workshop experiences among EVPA associates underscore the need for additional clarity and guidance regarding social impact measurement. On the other hand, EVPA analyses of existing resources for impact measurement and direct experiences working with VPO and social investors (SI) revealed, similar to the DBLP, that most methods and tools for measuring impact share a general framework.

Based on these findings, the EVPA published a manual based on the IVC that set forth a five-step framework as a guide for a social impact process definition (Hehenberger et al. 2013). The five

steps to adhere, according to the EVPA's manual, are briefly described hereafter:

1. *Setting Objectives*: Before starting with any evaluation, it is preliminarily necessary to set the scope of the impact analysis (why and for whom), the level (portfolio of social investments/individual social enterprise), and what the desired social change is. Objectives should be set at:
   - Level of VPO/SI (defining scope of impact measurement and the overarching social objectives the VPO/SI wants to achieve)
   - Level of investee (social issue to be solved, inputs/activities, expected outcomes)
2. *Analyzing Stakeholders*: Considering the different interests and different typologies of involved stakeholders, EVPA's methodology suggests to rank the multitude of potential stakeholders in order of priority, weighing their contribution to the completeness of the analysis against the resources required and analyzing their inputs (if any), activities, and potential outputs. Thus considering:
   - Level of VPO/SI (employees, board of directors, investors/donors)
   - Level of investee (direct and indirect contributors and beneficiaries)
3. *Measuring Results – Outcome, Impact, and Indicators*: Results must be clearly described and measured distinguishing the output, outcome, and impact that derive from organization's activity for its key stakeholders and understanding how different types of indicators can be used to map the social result of the organization's work.
   - Level of VPO/SI (based on the objectives of VPO/SI, it is possible to map results and consider portfolio-level indicators)
   - Level of investee (outputs, outcomes, impact, and indicators relating to the objectives of the social purpose of the organization)
4. *Verifying and Valuing Impact*: The last component of the circle is given verifying that the impact is not too subjective and whether it indeed was valued by the key stakeholders, considering quantitative and/or qualitative methods (by calculating the social value of an investment or otherwise) and comparing the results of the work against relevant benchmarks.
   - Level of VPO/SI (was nonfinancial support provided to investees, valued by the investee, etc.)
   - Level of investee (verifying and valuing impact for key stakeholders)
5. *Monitoring and Reporting*: At the end of the evaluation process, it is important to demonstrate, communicate, and share information. It is thus important to collect data and devise a system to store and manage the data as well as integrate this information into overall operations and report the data to relevant stakeholders.
   - Level of VPO/SI (what systems are required to collect, store, and manage data, reporting formats)
   - Level of investee (collection, management, and reporting requirements for the social purpose of the organization) (Hehenberger et al. 2013.

## Conclusion

Social impact is an important issue for nonprofit organizations that want to demonstrate, account for, and communicate the achievement of their missions. The problem is that it is not easy to measure social goals whether assessments are made at an ex ante stage, when deciding about investing resources in a project or activity or even a single action, or at an ex post stage – when it is necessary to demonstrate that the implemented project, activity, or action has achieved its aims.

The importance of the ex post level also depends on the fact that a nonprofit organization which demonstrates that it has achieved, and is achieving, its aims and targets can increasingly enlarge its credibility and, in this way, increase its chances of obtaining resources for future activities.

The last section of this entry showed that the measurement of social impact by non-profit

organizations still lacks a unique comparable standard as the one used in financial reporting systems, because – despite the ambitious aim of the two method catalogues presented above – there is not yet a common shared set of principles, techniques, and indicators. Nevertheless, the demand for metrics has increased because nonprofit organizations need to demonstrate, in a reliable way, their impact to funders, partners, and beneficiaries. Metrics to meet these needs have proliferated resulting in several competing methods for calculating social value. Despite the enthusiasm for metrics, few nonprofit organizations use sophisticated metrics (Mulgan 2010).

Indeed in the last decades, there have been many improvements in measuring outputs and outcomes, but there is still a long way to go for impact measurement, especially considering that impacts are different because, as showed in the previous sections of this entry, nonprofit organizations deal in tackling a wide range of problems and issues like social inclusion, empowerment, advocacy, community development, environment protection and also because nonprofit organizations are different both in size and aims. In a such complicated reality, it seems very difficult to reach an agreement on a common reporting framework that is acceptable to all relevant stakeholders (Gibbon and Dey 2011).

In conclusion it is possible to affirm that the next years will see an increase of new studies and projects, both by academics and nonprofit organizations' practitioners, in order to define a unique accepted method for social impact measurement.

University of Central Florida, Orlando, FL, USA

## Synonyms

Impact investment; Pay for Success bonds; Pay for Success financing; Social benefit bonds; Social bonds; Social policy bonds

## Definition

Social impact bond: form of impact investment in which investors fund evidence-based programs. If the funded interventions are successful, the sponsor is rewarded with a return on the initial investment. However, if the intervention fails, no repayment is required.

## Introduction

Social impact bonds (SIBs) are a means to provide funding for social service interventions. These tools of governance have the capacity to generate scalable solutions to complex issues vexing society, particularly in the areas of public health and safety, prison recidivism, homelessness, substance abuse, child welfare, mental health, and education. This innovative financing approach marries private sector, philanthropy, government, and nonprofit entities in hopes of eradicating problems which plaque communities. Innovative finance tools such as SIBs use the investment of money by private sector entities to foster effective social solutions for more resilient communities. SIBs facilitate public betterment through financing high-impact social welfare interventions while also contributing strong financial returns to investors. Programs funded with SIBs must be evidence based, providing a scientifically proven highly effectual service to a community (Social Finance 2014). SIBs allow for these special interventions to be funded by the private sector. If the programs are successful, the private entity is repaid at a pre-agreed upon sum of interest. If the strategies are ineffective, repayment is not required. SIBs ensure adequate monies are available to fund social welfare programming, help to incentivize effective interventions, and accelerate the rate at which individuals can receive needed services.

## What Are Social Impact Bonds?

Social impact bonds (SIBs) are a relatively new tool of government. Social impact bonds engage the collective action of the government, nonprofit sector, and private agencies to deliver more effective social programs for issues challenging communities. Specifically, SIBs can positively impact interventions in the areas of public health, substance abuse, mental health, public safety, prison recidivism, homelessness, child welfare, and education. Through SIBs, a potentially promising, often untested, social intervention is funded upfront with private sector and/or philanthropic capital (Social Finance 2014). The intervention must be an "evidence-based practice," which entails the clinical provision of services based upon scientifically proven, highly effectual standards and values.

Social impact bonds are a form of impact investment (Government of South Australia n.d.). Impact investments involve the financing of a business, organization, or company to promote positive societal or environmental change while also accruing monetary gain. Such investments are made with the intention of creating measurable social impacts upon a community's most vexing problems while also experiencing a preestablished financial rate of return for an investor (Government of South Australia n.d.). The government pays back investors with a bonus, if the outcome targets are achieved (Lower-Basch 2014). The decision as to whether a target is achieved is based upon the results of an independent evaluation (Social Finance 2014). If the stated targets are not met, investors are not repaid (Social Finance 2014).

The term, "social impact bond," is in reality a misnomer (Burton 2014). SIBs are not bonds in

the traditional sense but are private sector financing agreements which do not require government issuance of debt (Haglund 2013). Typically, when a loan is taken from a bond holder, the borrower is responsible for repayment with interest (Eames et al. 2014). In SIB programs, funding is secured through investors; the government agency only repays the initial expenditures, with interest, if contractual obligations are met (Eames et al. 2014). The rationale behind SIBs is to pay only for services that work. SIBs have been used with success internationally and in programs designed to reduce homelessness and prison recidivism, as well as in early childhood education and child health strategies (Cabinet Office 2013).

## How Social Impact Bonds Work

Social impact bonds are the result of government responding to social or human service issues. The process begins by the government identifying a problem needing a solution for the well-being of the community of citizens. The government makes requests for proposals based upon this issue. A private sector financing intermediary creates a social impact bond-issuing organization (SIBO) (Haglund 2013). The SIBO develops the structure, raises the capital, and manages the project (Haglund 2013). Generally, the SIBO is facilitated in doing this by using nonprofit social service agencies which provide the necessary expertise in working with at-risk clientele and the target populations (Loth 2012). The SIBO supplies these agencies with money upfront and contracts with service providers to provide evidence-based interventions for the social issue being addressed (Haglund 2013). The agencies are given perimeters and preset goals to identify when the program can be considered as successful. An outside advisor (independent evaluator) monitors the progress of the social service agency in meeting these established outcome measures and makes modifications, if necessary (Haglund 2013). This internal performance management component is integral in ensuring accountability and achieving proposed goals. An independent assessor or evaluator then determines from the results whether targets have been reached (Haglund 2013). If they have been attained, investors profit. If the preset goals have not been reached, the initial investment does not have to be repaid.

## Benefits of Social Impact Bonds

Social impact bonds promote stable, long-term funding of projects (Fletcher 2013). In the current financial environment, where budgets are constantly being slashed and tightened, SIBs provide an expansion of budgetary resources. SIBs are designed to address current social issues by combining evidenced-based solutions with economic gains. In addition, these tools of government improve outcomes, allow for quicker adoption of new ideas, and enhance flexibility for all key actors involved (Liebman 2011).

Improved outcomes are achieved through the performance management process which is engrained within the SIB model. SIB programs are, by their design, developed to achieve meaningful and measurable results through the constant appraisal and feedback loop of the outside advisor (Eames et al. 2014). This feedback loop provides for a more rapid learning of what works and the easier removal of what does not (Liebman 2011). SIBs increase learning and ultimately performance by embedding rigorous evaluation and a focus on outcomes into program operations (Lower-Basch 2014). Moreover, by shifting the monetary risk away from the government and onto private investors, taxpayers are no longer placed in the untenable position of having to absorb lost capital for unsuccessful programs (Eames et al. 2014).

This shift to the private investor also achieves an accelerated adoption of new solutions (Liebman 2011). The current system of government funding for programs creates significant barriers to innovation (Liebman 2011). The present system can be slow to adopt new strategies and

procedures due to the risks associated with innovation. However, through SIBs, risk is transferred to the private sector and opens room for the marketplace of ideas (Liebman 2011). Key players (government, private investors, social service agencies, evaluators) are provided with flexibility in customizing "the services provided, mode of delivery, specification of outcome goals, and length of time" to meet project needs and demonstrate outcomes (Eames et al. 2014, p. 15; Lower-Basch 2014). In another form of flexibility, social impact bonds can also be uniquely apolitical. Eames et al. (2014) astutely advise when advocating for social impact bond utilization that it has the capacity to appeal to both conservative and liberal audiences. It can be framed as "advantageous for fiscal conservatives and proponents of government funded social services alike" (Eames et al. 2014, p. 23).

Over the last few years, agencies in several countries have applied the innovations of social impact bonds to their most pressing social problems. The United Kingdom is where SIBs were first employed in 2010 (Cabinet Office 2013). It was used to decrease the recidivism of men returning home from Peterborough Prison (Cabinet Office 2013). Since then, social impact bonds have been utilized in several areas to reform public service delivery throughout the country in the areas of child welfare, mental health, education, and substance abuse. The US SIB market also has rapidly evolved from concept to launch (Social Finance 2014). In 2012, New York City introduced the first SIB program in the United States with the goal of reducing recidivism rates of young adults at the Rikers Island Correctional Facility (Bloomberg 2012). Today, at nearly $50 million, the US SIB market is now the largest in the world (Social Finance 2014).

## Challenges/Criticisms

As with all things pertaining to the public sector, the integrity and motivations of the financial investor must be reliable and above reproach. Lower-Basch (2014) explains that past experiences with outcome-based performance measures have provided cautionary tales to be heeded. In the past, tying high stakes (return on investment) with service outcomes has resulted in unethical behaviors. These behaviors include "disincentives to serve the neediest populations; skewing services to focus on the selected outcomes of interest at the expense of other aspects of a program ('tunnel vision') and winding up with programs that affect the measured indicators but not the underlying outcomes ('teaching to the test')" (Lower-Basch 2014, p. 16). Lower-Basch (2014) warns social impact bond users to closely regard these barriers and to act to mitigate these negative actions.

Other challengers to social impact bond usage argue that such programs reinforce a "resolutely one-dimensional approach" to complex socioeconomic problems and "involve a subordination of the public interest to private interests" (Shergold 2013). Moreover, there are opponents who state social impact bonds "could be used to justify governments reducing their continuing financial commitment to social services" (Shergold 2013).

## Guidelines for Using Social Impact Bonds

SIBs are only appropriate for specific problems which meet key criteria (Social Finance 2014, p.9). Successful and effective SIB implementation for human service problems must have (1) sufficiently high net benefits, (2) measurable outcomes, (3) treatment populations which are well defined upfront, (4) credible impact assessment, and (5) any unsuccessful performance must not result in excessive harm (Liebman 2011, p. 4). Problems identified as needing intervention should be those which will substantially benefit the overall well-being of the community. Typical areas acknowledged as requiring intervention are substance abuse and mental health, child welfare, housing/homelessness, public health, public safety (prison recidivism), and education.

Programs designated as receiving funding from the SIBs should be effective evidence-based programs with measurable outcomes. These measurable outcomes determine whether the interventions are successful and worthy of repayment. The treatment populations need to be appropriately designated, and exclusions to the target population need to be clearly articulated. A credible impact assessment is required to ensure the treatment population is receiving quality services and the community is benefiting from the implementation of the evidence-based program. The presence of the independent, neutral evaluator helps to ensure the program's merits are aptly weighed. Finally, as the entire purpose of this social benefit enterprise is to ensure the betterment of society, it is critical that if an intervention is unsuccessful, the potential harm done to the individual(s) does not outweigh the possible positive impact of the programming.

Additionally, there are three fundamental things which should not be forgotten in working with SIBs, as they greatly impact the effectiveness and utility of these tools. The first is do not underestimate the importance of the contract. SIBs are the epitome of the public-private partnership. A public-private partnership is a contractual arrangement between a government agency(ies) and a private sector entity(ies) to provide services. As such, the contract is critical to SIB usage, especially considering the high degree of complexity in human welfare-related issues. The contract should hold provisions which prevent breach by an SIBO when it is foreseeable that targets may not be reached and hold the agency accountable to its commitment (Eames et al. 2014). The contract should also include specific measurable goals to prevent breach (Eames et al. 2014). Within the contract, key attention should be placed upon setting outcomes for each phase of the program's evolution (Eames et al. 2014).

Secondly, those seeking to use SIBs should work actively with legislators to reduce the urge to cut state funding when savings are achieved. If the intervention is successful, do not delete current state funding allotted for the intervention. Use state funding in conjunction with SIB utilization to allow programs to expand (Loth 2012). Private investors and service practitioners should lobby and seek congressional authority to expand the use of long-term performance contracts for SIBs (Liebman 2011). SIB-supported programs will need longer implementation times to provide reliable performance measurement. It should be a recommendation that such contracts are given a minimum of 5 years.

Finally, as impact investment is relatively new, lessons and failures learned from each application of SIB to a social malady should be noted for future reference and research. When seeking to replicate a program, close attention should be paid to demographics, economics, and cultural context in which successful programs have been achieved. Practitioners should be on the lookout for place-sensitive policies – to think because it is a good policy for one area that it can be picked up and automatically applied to another area may be naïve.

## Conclusion

Social impact bonds are tools of governance which are gathering favor worldwide for their ability to improve outcomes and the elasticity of service interventions through the private financing of public social welfare needs. Social impact bonds present as a special culmination of the best of the private sector, nonprofit, and government agency worlds with its emphasis on innovative financing for evidence-based programs. The internal performance management and independent evaluation components within SIBs promote accountability and goal achievement for public betterment. In today's financial pinch, the additional flexibility and funding SIBs can provide to social welfare improvement projects can be transformative to communities.

Co-production; Hybrid organizations; Nonprofit; Social entrepreneurship

## Definition

Social innovation is a process that results in a new and better solution (products, services, models, markets, processes) to meet social needs. It is specific for a particular territory or context and leads to new or improved capabilities, relationships between participants and end-users, or use of assets and resources.

## Introduction

Social innovation is the application of new solutions to social problems in areas such as welfare, health, education, youth unemployment, adaptation of migrants, and territorial integration of regions. Social innovations allow nonprofits and other organizations to meet needs of society more effectively than existing options, respond to social challenges, offer new solutions to social problems, develop social interaction, and create alliances (Caulier-Grice et al. 2012). There are different types of social innovations. Most commonly the distinction is between product or service innovations and process innovations.

Social innovation is a multistage process rather than a new idea or a result. Other typical features of social innovation include a social purpose, perception of being new in a certain context, close cooperation and new modes of interaction between different stakeholders, joint creation with end-users, and, to a less extent, an entrepreneurial character.

Social innovations may take place in all sectors of economy as a response to a crisis or as a result of a mismatch between the social needs of citizens and available options to satisfy their needs. More often they emerge at the hybrid intersections between different sectors of economy. Today even in the countries where state traditionally assumed the primary responsibility for providing social services, other interested parties, such as nonprofit organizations, voluntary associations, enterprises, and individuals, are starting to actively participate and cooperate in the process of creating new solutions to satisfy social needs together.

Nonprofit organizations are very important for creating social innovation. They possess a set of distinctive characteristics that contribute to their high potential for producing and distributing social innovations. In particular, nonprofit organizations follow social mission and represent the interests of certain groups, recipients of their services, who are end-users (Anheier et al. 2014). During the process of social innovation nonprofit organizations often form new relationships and networks, modify the ways of interactions, and may contribute to changes in organizational structures.

If an organization embarked on a social innovation process also has a purpose to maximize and distribute profit, it acts in the realm of social entrepreneurship. Business organizations, which have both a social mission and a goal to maximize profit, are called social enterprises. Social enterprises may implement social innovations independently or participate in a social innovation process with other organizations.

## Types of Social Innovations

Social innovation is the application of new solutions to social problems. As such it may be categorized depending on whether the innovation involves new service concepts, new interfaces for client communications, or new systems of service delivery. Other classifications include differentiations by the source of leadership which may be driven by the supplier, the client, the company itself, the service user, or more general paradigmatic changes. Some other approaches distinguish product, service, social, organization, governance, system, and marketing innovations. Most often typologies distinguish between product and process innovations, but some social innovations might cut across more than one type.

Service or product innovations offer new interventions or enhanced services or products to meet social needs. Product innovation refers to innovation as an outcome that manifests itself in new products, product features, and production method. The proposed solution should be specific for a particular territory and beneficiaries. New professional competencies in the field of social services are evolving in the innovation process. Examples of such innovation are car-sharing, zero energy housing developments, and new labor opportunities to reduce unemployment of people with disabilities or youth.

Process innovation, instead, concerns the organizational and social processes that produce innovation, such as individual creativity, organizational structure, environmental context, and social and economic factors. Process innovations are mainly related to coproduction of new services as well as to reorganization of the decision-making process which previously either did not take into account interests of all relevant stakeholders or was imbalanced. Innovations are associated with power relationships as delegation of authority, for example, from the state to new actors, including representatives of civil society. Process innovations produce new patterns of cooperation that facilitate community activities. Examples of a processs innovation include participatory budgeting, crowdfunding, or online systems of participation in decision making, via which interested parties may suggest a particular course of action in a project of a nonprofit organization or government, or vote for them.

## Characteristics of Social Innovations

Social innovation is a social phenomenon with several distinctive features. In particular, these features include a social purpose, perceived novelty of socially innovative practices in a certain context, significant changes in procedures of stakeholder interactions and in relationships between them, engagement of end-users and beneficiaries in the process of co-creation and entrepreneurial nature.

First and foremost, social innovation is rooted in a *social purpose*, helps to solve social problems and provide social services in the community. Social nature of innovations implies meeting neglected social needs and orientation towards well-being of beneficiaries.

Furthermore, social innovations create *practices perceived to be new in a particular context or community.* Social innovations address actual and legitimate social problems, which means there is a basic agreement within the community that a particular social problem needs to be addressed.

Social innovation is a *multistage process* rather than a stage of initial creation of a new idea. After its initiation a new idea needs to go through several stages: developing of a viable plan, testing, implementing, and, if successful, scaling and diffusion for the benefit of recipients. The process implies specific challenges for managers of all interested organizations, who must incorporate special procedures to allow the aforementioned stages in their daily routines. Moreover, for the success of a social innovation it is crucial to take into account the interests of all stakeholders.

*Close cooperation and changes in the existing models of stakeholder interactions and relationships* are essential for a social innovation to take place. Private companies, nonprofit organizations, and citizens operate jointly in the social field (Osborne and Brown 2005). Organizations no longer innovate in isolation but do so through a complex range of interactions with external actors. So-called hero-innovator whose creative genius allows creating and promoting innovations is more a myth than a reality. Individuals and separate organizations cannot convert an innovative solution to the next stage of development independently by working insilos. Innovation depends on the willingness of governments, nonprofit organizations, and other interested parties to participate in an open process of exchange and joint use of experience, knowledge, skills, technical support, and other resources.

Social innovation often happens at the *hybrid* intersections between different sectors of economy (Sørensen and Torfing 2015). The era of clear separation between sectors is over. Business and the third sector are actively acquiring new roles in provision of social services. The implementation of social innovation increasingly depends on the joint activities of government, nonprofit organizations, and business. There is a considerable current overlap between the nonprofit sector and the market which modifies existing patterns of operation and introduces new actors to the field. Such hybrid organizations as social enterprise and new forms of cooperatives fulfill various functions in the social sphere, along with or instead of traditional nonprofits and public organizations.

*Entrepreneurial character* is also an inalienable trait of social innovation. In this concern social innovation is similar to social entrepreneurship. Both phenomena infer social missions, involve modification of existing socioeconomic arrangements, and contribute to economic growth. For example, some social enterprises solve the problem of unemployment, especially for vulnerable groups, like persons with disabilities, provide or expedite access to services, and reduce inequality. The difference between social innovation and social entrepreneurship is that the latter also implies goals to maximize and distribute profits.

*Co-creation with end-users* is another important characteristic of social innovations. Co-creation, which is sometimes called coproduction, means active engagement of multiple agents, including end-users, in various stages of the social innovation process. End-users's experiences, needs, and desires are incorporated in the process of social innovation and therefore contribute to solving their own social problems. Co-creation may involve interested parties from

nonprofit organizations, public sector providers, policymakers, as well as businesses. Co-creation implies crossing boundaries between organizations and sectors, as well as minimization of vertical, bureaucratic, and paternalistic principles in formation of public policy.

## The Role of Nonprofit Organizations in Driving Social Innovations

Nonprofit organizations are believed to be the primary sources of social innovations. It happens due to such inherent characteristics as their social mission, high aptitude for experiments, sensitivity to the needs of their clients, and capacity of engaging volunteers, different stakeholders, and attracting assets from various sources. Innovativeness of a particular nonprofit organization largely depends on its management.

Two basic characteristics of nonprofit organizations are their *social mission and high aptitude for searching and using experimental approaches* to serve social needs and create common good. Nonprofit organizations are able to develop and implement innovative services or new methods of delivering community services even in such cases when expenses are too high. In such situations governmental organizations and businesses might withdraw themselves because they act in the conditions of more strictly regulated system. The revenue structure of nonprofits is usually quite diverse, which contributes to their flexibility in using the funds, and therefore allows for experimental approaches to satisfying the unmet needs.

Also, the nonprofit sector is more *effective in being sensitive and responding to societal signals* neglected by the other sectors. Nonprofits are more responsive to the needs of vulnerable target groups and are generally more successful in reaching marginalized population. Direct proximity of nonprofit organizations to beneficiaries increase validity of produced social innovations to the beneficiaries' interests and values.

Furthermore, nonprofits have a *capacity to involve various actors and volunteers* in their interactions, even if these actors have not cooperated in addressing any social issue or their communication has had a hierarchical nature before. Volunteers play a central role in creating social innovations, as they constitute an additional link between nonprofit organizations and communities, their values, objectives, needs, and competencies. From the institutionalism and human agent change perspectives volunteer engagement is considered to be correlating with an individual's role in social transformations and modifications of current institutional practices. Individuals problematize, redefine, and restructure social and organizational boundaries of institutions and roles (Edwards-Schachter and Wallace 2017). Individuals and grassroots play multiple roles in innovation processes both as consumers of social services and as actors involved in discussions of social problems and potential solutions. In accordance with these arguments it is not an organization but rather individuals who play a key role in producing social innovations. Social innovations are believed to have a higher level of bottom-up and grassroots involvement than other types of innovations.

From the organizational perspective, certain aspects of *nonprofit management to* a large extent define the level of innovativeness of an organization and therefore its capacity to participate in social innovations. For example, external stakeholders' participation in the strategic management processes of a nonprofit organization (Parsons and Broadbridge 2004), close relations and frequent communications of the leader with external stakeholders, participation of the organization in professional associations and networks have a positive influence on the overall innovativeness of a nonprofit organization. Internally, more innovative nonprofit organizations appear to have enough professional employees to let them specialize in a particular job and set up a motivation system so that it promotes innovation among employees and volunteers. Well-organized communications systems between employees, volunteers, and different levels of management also contribute to higher levels of innovativeness. The board, if present, is especially important for nonprofit organizations: diverse board and the board's inclusion in the process of decision-making increases innovativeness of an

organization. The role of a leader is tremendously important in starting and advancing innovations in an organization. Besides the need for the leader's unambiguous support for an innovation to happen, his or her personal characteristics, such as communication skills, or number of years in a leadership position may influence the organization's innovativeness. Organizational culture fosters innovations when it is explicitly oriented towards tolerance to others' ideas and works (Jaskyte and Dressler 2005) and hinders innovations when there is orientation towards stability, safety, and nonconflict (Jaskyte and Riobó, 2004). Inclusion of initiating and implementing innovations in the strategic plan and vision of the leader and the whole team, as well as active use of the best practices, purposeful allocation of human resources, time, and other resources specifically for innovations will also contribute to a nonprofit organization's innovativeness (Thom 1990).

## Social Innovation Research

The complex phenomenon of the social innovation has recently become the area of focused attention of researchers and is therefore still at the stage of initial understanding and conceptualizing of social innovation. The research differs in focus, methods and approaches used, scope, and regional distribution. Due to high aptitude of social innovations for solving social problems, understanding the phenomenon has become very important for governments, policy makers, and social service providers. The researchers have been able to identify the aforementioned types of social innovation, its major characteristics, and some conditions of its appearance. For example, some of the conditions include large size of the nonprofit sector and high level of grassroot activity.

Social innovation studies are conducted on at least three levels. On the first level, a case and characteristics of single innovations can be measured. On the second level, scholars analyze the societal potential of territories or societies to produce social innovations which includes analysis of framework conditions as ecosystems to social innovation. On the third level, a social effect of social innovations on the societies can be investigated and examined.

Studies can be done in quantitative, qualitative, or mixed-methods perspective. Qualitative approaches such as case studies, and interviews, allow for initial exploration of the issue and acquiring a better understanding of its nature. These approaches lead to a better grasp of the current rise and spread of social innovations. They help clarify how social innovations appear in different sectors, what policy conditions, financial and nonfinancial incentives foster social innovations, and what contributions are made by end users. Case studies of examples of social innovations are collected in such projects as Boosting the Impact of Social Innovation across Europe through Economic Underprintings (SIMPACT), Combating Inequalities through Innovative Social Practice of, and for, Young People in Cities across Europe (CITYSPYCE), Learning Innovation in Public Sector Environments (LIPSE), and Public Participation in Developing a Common Framework for Assessment and Management of Sustainable Innovation (CASI), and in the global context such projects as Social Innovation – Driving Force of Social Change (SIDRIVE) and Transformative Social Innovation Theory should be mentioned.

It is especially important for policy makers to understand to what extent public institutions, nonprofit organizations, businesses, and communities are ready or able to participate in social innovations, to what extent they already participate. Quantitative approaches help to measure that. They are typically used to identify social innovation indicators and compile indexes. For instance, Theoretical, Empirical and Policy Foundations for Building Social Innovation in Europe (TEPSIE) project proposes more than 15 different indexes, which to some extent allow to judge about the development of social innovations in a country or to make a cross-country comparison. Some global innovation measurement projects include Innovation Union Scoreboard, and Global Innovation Index. Another research approach suggests mapping of social innovations. The method implies different ways of visualizations and observation of dimensions of social innovation.

The major challenge in current social innovation research is that scientists do not have a common ground in identifying the object of the study. Its manifestations are quite diverse and scientists are still trying to clarify the most important characteristics and the way to measure them.

## Conclusion

Social innovations are an increasingly prevalent social practice aimed at solving social problems both locally and internationally. Social innovation presents opportunities for citizen participation and cross-sector cooperation, which has high future potential for serving needs of the society. Social innovation is a complex phenomenon with a set of distinguished characteristics. It is based on a social purpose, creates practices new for a community, and is a process rather than just a new idea or a good result. It involves close cooperation of different stakeholders and often leads to changes in relationships and modes of interaction, which leads to merging of the different economic sectors, entails new forms of governance, and implies a process of co-creation with end-users of social policies or services. Entrepreneurialism is an essential trait of a social innovation, which uncovers its similarities with social enterprises. The critical distinction between them is that social enterprises besides pursuing social goals set profit maximizing targets.

A special role in driving social innovations belongs to nonprofit organizations. Besides the important role of the governments, which create favorable social, political, and economic conditions, nonprofit organizations by themselves become drivers of social innovations. It happens due to such characteristics of nonprofit organizations as their social mission and high aptitude for searching and using experimental approaches, efficiency in responding to societal signals, *capacity to involve various actors and volunteers.* The way an organization is managed and particularities of the management process and structures may play an important role in its innovative capacity.

Types of social innovations include innovations categorized by source of leadership, changes in products, processes, or organizational structures. Despite a lot of information already available about social innovation, it is still a relatively new concept and therefore is a focus of vigorous research and a challenge for social scientists, who are still trying to clarify the concept, its major characteristics and metrics.

# Social Innovations in Housing in Slovakia

Maria Murray Svidronova[1], Helena Kuvíková[1], Beata Mikusova Merickova[1] and Juraj Nemec[2]
[1]Department of Public Economics and Regional Development, Matej Bel University, Banska Bystrica, Slovakia
[2]Department of Public Economics, Masaryk University, Brno, Czech Republic

## Synonyms

Co-creation in housing; Innovative housing provision; Social housing

## Definition

Innovation in the provision of social housing may be called "co-creation." Co-creation is a social innovation that seeks solutions to the production and financing of public services through collaboration with different stakeholders, including non-governmental organizations. In this way, the government is possible to save on public expenditures if it would decide to support the innovative approach in social housing provision.

## Introduction

Although housing as a service is provided by a mixture of market, public policy, and informal sectors, the need for housing is one of the basic living needs of a person's life; thus conditions for the production and realization of these goods are regulated by legislation in each developed society (Carter and Fortune 2007).

The inability of some groups of residents to secure housing using their own resources is one of the main reasons for public sector intervention in the housing sector (Kuvíková et al. 2015). On the other hand, the public sector is coping with many austerity measures after the financial (2007), economic (2008), and social crises (2017) and looking for innovative, more efficient, and sustainable solutions (Blumenthal and Martin 2007).

Resolving housing issues for people unable to secure their housing is linked to the concept of social housing, which represents a specific part of the housing sector as such. The way of social housing implementation has a significant impact in particular conditions on the role of non-governmental organizations (NGOs) within the housing sector.

The entry focuses on a case of housing provision: an innovative solution to provide social housing by the NGOs that increases efficiency in providing this public service and thus saves the public budget.

## Social Housing

There are many names and definitions of social housing, called affordable housing or limited profit housing as well, yet the uniform name and definition used at international level are lacking. The definition according to Carswell (2012), which is also used by the EU in the creation of conceptual materials, distinguishes two meanings of this concept. According to the first meaning, social housing is any housing where some form of public support or social assistance is spent, directly or mediated. Such a definition of social housing is very general, especially if any private housing stock should be supported from public sources and included in the social housing sector. The second meaning of the term is related to housing provided by the state or other public or private law institution on a non-profit basis.

Despite the fact that social housing is now a common concept, the way in which social housing policy is implemented in practice differs between EU countries. The main reason is the significant differences in social and housing policies of individual member countries who apply their own models for social housing provision.

In this entry social housing is understood as a housing that is affordable to people on low incomes and needy households or available for specific groups of people (e.g., refugees) and provided by public sector and/or third sector (NGOs).

## Housing in Slovakia

The situation with the housing stock in Slovakia, especially in the social housing, is a result of the housing policy. The post-1989 objectives of the Slovak housing policy have resulted in the large-scale privatization of state rental flats and the reduction in new rental housing. State-subsidized social rental housing programs have been unable to meet the social demand for affordable rental dwellings. Socially marginalized groups, in particular Roma people, have been hit the most by the post-1989 changes and the lack of official social housing construction (Svidroňová et al. 2017).

The concepts of the housing policy fall under the Ministry of Transport, Construction and Regional Development of the Slovak Republic. Since 1994, a total of six concepts have been developed, the most recent of which was approved in 2015 with a horizon of 2020. Nevertheless, the social housing agenda as part of the housing policy is not institutionalized in Slovakia.

In order to help the socially disadvantaged groups of the population, the provision of a housing allowance as an addressable instrument of social policy is applied under the legislated conditions. A housing allowance can be defined as a state subsidy to cover the cost of housing for citizens and families whose total net income does not reach a multiple of the total subsistence of the citizen (family) to provide nutrition and other basic personal needs and the amount necessary to cover necessary household and certain (calculated) constants. At present (2019), the amount of the housing allowance is €55.80 per month for an individual citizen in material need and €89.20 per month for a family in material need. The housing allowance is stopped if the authorities find out that a citizen in material need does not pay a debt connected with their housing. These eligibility criteria are checked every 6 months.

The current State Housing Policy Concept 2015–2020 summarizes recent developments in housing policy, outlines priorities for the coming period, and defines the tasks that ministries have to fulfill in order to meet the goals set. The main objective of this concept of state housing policy is the sustainable development of housing. The concept also defines specific objectives, which are to create new financial instruments to support housing development; increase the availability of housing; develop the private housing sector; increase or at least maintain the same share of public expenditure on housing; introduce a new housing allowance; and support the development of the third sector in housing provision.

## Co-creation as a Social Innovation

Innovation in the provision of social housing by the third sector may be called "co-creation." Co-creation is a social innovation that seeks solutions to the production and financing of public services through collaboration with different stakeholders. The innovation in the production process of public services is considered as (1) an open process, with the involvement of end users in the design and development of goods and services, and (2) the change in the relationship between the involved stakeholders (Voorberg et al. 2017). One of the central elements in the concept of social innovation is the active participation of citizens and grassroots organizations in order to produce social outcomes that really matter (Bason 2010). Participation on the part of citizens in the development and subsequent implementation of an innovation is of great importance in terms of the success of the public service innovation process because they are the

final consumers of the public service (Svidroňová et al. 2019). All these elements are followed in the analyzed case study of ETP Slovakia.

## Co-creation in Social Housing by ETP Slovakia

The organization ETP Slovakia has been operating in Slovakia since 1992. They work with disadvantaged groups, especially from segregated Roma communities, as well as refugees. One of their projects is called "Building hope: from a shack to 3E house," and it is focused on the development of housing for those families living in unsatisfactory conditions to improve the quality and conditions of housing by themselves with the help of a building teacher. They have also focused on working on their clients gradually acquiring work skills, which is a prerequisite for easier implementation in the labor market and a gradual inclusion in mainstream society. A very important part of the program is education of the clients, mostly Roma citizens, in the fields of financial literacy (to motivate them to stay in the saving program, it helps to teach them to save money in the future as well), running the household (taking care of the new homes, in the past a lot of furniture was sold or simply burnt during the winter), and basic personal hygiene habits.

ETP Slovakia runs a community center in Rankovce – a small municipality with 889 inhabitants in the east of Slovakia – 67.5% of the total population are Roma, living on the outskirts of the municipality, mostly in illegal buildings (houses built without building permission or on land they do not own). Among the major problems are no electricity and water in these houses, which leads to a lack of hygiene and other issues.

Since January 2013, in cooperation with local self-government of Rankovce, field social workers of the ETP and the local association For a Better Life have supported 16 families. Thanks to the savings and microloan program the ETP helped them with the legalities of building either new houses or finishing incomplete houses by themselves with the subsequent legalizing of the houses into their personal property. The essence of this cooperation is not only the legal construction of the homes but also the development of the individuals. These experiences relate specifically to construction in segregated Roma localities.

Self-construction can fundamentally improve the basic living conditions of the Roma families, which subsequently has a direct impact on the family budget (energy savings) and the health of family members, improving the opportunities for educating the children and earning an income from legal work. Following the official approval of the finished house and paying the microloan, the client becomes the owner of the property. They have a higher social status and are more respected within the community, and they also become more independent. Self-help construction can help socially reliant clients get out of the poverty. By receiving financing via microloans, clients also acquire financial skills, which can then be applied in everyday life, i.e., learn to save money and realize the value of money and the necessity of planning the family budget.

The total cost of one house is around €12,000, of which one third is funded by the ETP and sponsors and the rest of the sum is paid by the Roma citizens. They are actively involved in the savings program, which helps them to save around €400, and the microloan program provides an interest-free loan amounting around €6,000 to finance the building of the houses. As a bonus for paying the installments, they can get up to €1,200 from the ETP.

Cost-benefit analysis (Svidroňová et al. 2019) proved that the state could start saving on public budgets after 4.5 years from the first investment – if instead of paying the housing allowance, the state would support the self-construction of the legal houses for the Roma citizens.

Homebuilding in itself and the demands placed on clients during construction help to change the client's personality and their lives in a comprehensive way. Many times, the new home is the most important thing that the clients have achieved in their lives and managed by their own strength. This represents a great personality and attitude shift from passive waiting for help from the environment and reliance on it. The housing is not just the provision of a "roof over one's head."

The process of self-help construction, maintenance, and care of one's own home includes many activities that develop societal, social, financial, work, and other skills of the inhabitants of the newly built homes. The number of builders-clients from Rankovce, who are employed on a permanent basis, rose from 2 in 2013 to 11 in 2017. In other words, 11 families have emerged from the poverty trap and do not receive material need assistance. Quantified savings could be even higher. Based on interviews with the NGO director, an internal calculation of the organization was provided that demonstrates state savings if it does not need to pay benefits and at the same time there would be an increase in demand in the local economy. Thanks to the involvement of households in self-help and self-financed home construction, the participating citizens managed to find permanent jobs. Demand (disposable income) of households in the area has increased twice (Svidroňová et al. 2019).

## Conclusion

In ETP Slovakia, cooperation between the third and the public sector was demonstrated in the case of social housing in the villages of East Slovakia where ETP Slovakia operates. It provides microloans as well as financial and social education for the population. Involvement of the citizens themselves in sharing the financial costs of construction as well as the building work creates a sense of co-ownership, and these houses are not as quickly destroyed as is the case with allocated state-owned flats (as proved by Mikusova et al. 2015). This initiative can be a good basis on which to develop the provision of housing services by the third sector by implementing properly chosen recommendations. Several NGOs in Slovakia have established cooperation with ETP Slovakia that shares its know-how, so the social housing program is spreading to more municipalities, bringing positive results. After the international awards for this program (the European Commission Award for Best Projects of Building a Social Society, the Golden Award from the European Economic and Social Committee), ETP Slovakia prepared free methodology in English "Step by step: from a shack to 3E house," which can be used by NGOs abroad.

If the state were to adopt a model of construction that has been tested in Rankovce and applied it to other socially marginalized communities, the development of the neglected communities would be very significant. The state should adapt legislation and forms of support for those who actively want to and can participate in changing their social and economic status. Without state support, this model of construction cannot be implemented by just one nongovernmental organization for the tens of thousands of socially and economically excluded families.

It is very important to realize that by just assigning a flat, the problem of social housing for the target groups has not definitively been resolved, although in some cases this is true. However, much more is the case where social housing target groups also need other types of services, such as lessons on finding a job, how to manage finances, in some cases lessons on basic hygienic habits and taking care of the allocated housing, etc. These services should be set up and provided in all cases where social housing is provided, since it also ensures regular monitoring of the situation and the state of the houses (Svidroňová et al. 2017; Suchalová and Staroňová 2010). This was the case of ETP Slovakia; they have brought the innovation in social housing by combining self-help construction and education. Self-help construction of homes resulting in private ownership financed by microcredit solves the problem of social housing more efficiently and at the same time saves public resources. The selected approach offers people the opportunity to take care of themselves.

Notwithstanding the positive results achieved, the innovative solution of ETP Slovakia cannot be considered a universal tool for combating poverty, yet it is a powerful tool in solving the social housing issues for the poorest. It also helps save public budgets by reducing the amount of housing allowances paid and moreover in decreasing the amount of material need assistance that needs to be paid.

# Social Intelligence

Daniel A. Belton, Ashley M. Ebbert and Frank J. Infurna
Arizona State University, Tempe, AZ, USA

## Synonyms

Emotional intelligence; Perspective taking; Social intelligence; Social relationships

Social relationships are an invaluable component of one's life. The quality and structure of social relationships are consistently associated with better outcomes across the lifespan, ranging from academic achievement and substance use in adolescence to mental and physical health and longevity in adulthood through old age (Holt-Lunstad et al. 2015; Umberson and Montez 2010). More specifically, empirical evidence from research studies has repeatedly shown that reporting stronger social relationships and being more integrated or active in one's social network is associated with feeling happier, better coping with daily and major life stressors, protecting individuals from the incidence of disease, and living a longer life (Cacioppo et al. 2015; House et al. 1988; Infurna and Luthar in press). Given the importance of social relationships, understanding how to maintain and strengthen them is essential. Our focus is on describing how social intelligence is one avenue for navigating the nature and development of social relationships across the lifespan. This is especially critical in the world today, as the makeup of social relationships is constantly evolving, given technological advances and structural changes within schools, businesses, and families. In particular, the focus of this entry is as follows: (1) defining social intelligence; (2) how social intelligence is measured; (3) the importance of studying social intelligence; and (4) whether or not social intelligence can be learned.

## Social Intelligence

Social intelligence is a major building block of developing and maintaining social relationships. Thorndike (1920) originally explained social intelligence to be a facet of generalized intelligence and defined it as the ability to understand humans and act wisely in human interactions. Snow (2010) further expanded upon Thorndike's definition by describing that social intelligence is the accumulation of knowledge, cognitive abilities, and affective sensitivities that allows individuals to navigate their social world. Honeywill (2015) and Albrecht (2005) described social intelligence

as the capacity to get along with others and navigate complex social relationships and environments. Although the definition and understanding of social intelligence has evolved over the years (Thorndike 1920; Guilford 1967; Kosmitzki and John 1993), research on the topic has consistently provided a generalized explanation of the concept of social intelligence and its potential benefits to society. We next discuss the myriad of research contexts through which social intelligence has been used to further our knowledge and understanding of this idea.

## How Is Social Intelligence Measured?

A multitude of social intelligence inventories have been developed with an aim towards understanding and measuring individual differences within social intelligence (Walker and Foley 1973). Several inventories focused on the assessment of an individual's capacity to understand others: George Washington Social Intelligence Test (Hunt 1928; Moss et al. 1955), the Dymond Rating Test (Dymond 1949, 1950), and the Six Factor Test of Social Intelligence (Composed of six tests that examine four different forms of cognition of behaviors: (1) cognition of behavior implication is the ability to predict what will occur after a given social situation; (2) cognition of behavioral classes is when an individual is capable of seeing similarities in behavioral information in varying expressional modes; (3) cognition of behavioral systems is the capability of analyzing the interaction of individuals and organizing a series of situations or systems; and (4) cognition of behavioral transformation refers to the ability of being flexible with one's interpretation rather than ridged; O'Sullivan et al. 1965; O'Sullivan and Guilford 1966). More recently, Silvera et al. (2001) developed a questionnaire, the Tromsø Social Intelligence Scale, which examines individuals' social skills, as well as their ability to understand others and process various social information. These inventories assessed social intelligence as an individual differences factor through a structured questionnaire, resulting in subjective responses that provided researchers with one's level of social intelligence. We next discuss the importance of studying social intelligence, with a focus on the significant association between social intelligence and various pertinent outcomes.

## Why Is It Important to Study Social Intelligence?

Thorndike's conceptualization of social intelligence has generated research in various disciplines, including leadership development, business and economics, and developmental, cognitive, and behavioral psychology. Social intelligence research has not only provided extensive knowledge surrounding the concept but has also helped develop an understanding of the context in which it is applied. Empirical evidence suggests that reporting lower levels of social intelligence is associated with the development of various psychopathology, such as depression, anxiety, and loneliness (Faust et al. 1985; La Greca and Lopez 1998; Hawkley and Cacioppo 2010). Highlighting the general importance of social intelligence beyond psychology, Zaccaro et al. (1991) framed social intelligence as a quintessential facet of an organizational leader. For example, empirical evidence suggests that organizational leaders who have two prominent characteristics of social intelligence, social perceptiveness and behavioral flexibility, are more likely to report better success at work, in addition to a better work atmosphere and productivity (Zaccaro et al. 1991). In problematic organizational situations, leaders high in social intelligence are more flexible with their responses and more aware of the various demands and requirements of those situations (Zaccaro et al. 1991). Additionally, Goleman and Boyatzis (2008) added to the existing literature about social intelligence's

role when dealing with leadership by explaining the importance of social intelligence when defining the key characteristics of leaders within business environments. The recurrence and dissemination of social intelligence as a construct within various researching communities emphasizes the importance to pursue future research on social intelligence. Given the implications social intelligence has for successfully developing and maintaining social relationships, we next discuss whether social intelligence can be changed. In other words, we examine whether interventions focusing on social intelligence can lead to improvements in social relationships and pertinent outcomes over time.

## Can Social Intelligence Change or Be Learned?

Research focusing on social intelligence has provided society with a better grasp on the concept of social intelligence and how it influences social aspects of life through improving our understanding of the contexts and environments in which social intelligence exists (Zaccaro et al. 1991; Goleman and Boyatzis 2008; Zautra et al. 2015), why it is important in those situations, and how it can positively influence people. More recently, social intelligence research has led to the development of programs aimed at investigating whether social intelligence can be taught and improved upon. As previously mentioned, social intelligence is an integral part of the development and maintenance of social relationships, which are directly linked to an individual's mental and physical health. In a study by Berkman and Syme (1979), it was found that individuals with fewer social relationships had higher rates of mortality compared to their peers with an average amount of social relationships. Additionally, a myriad of deleterious health problems have been associated with a fewer number and a reduced quality of social relationships, including cancer, cardiovascular disease, high blood pressure, recurrent myocardial infarction, atherosclerosis, and slower wound healing (Ertel et al. 2009; Everson-Rose and Lewis 2005; Robles and Kiecolt-Glaser 2003; Uchino 2006). Physical health problems are not the only negative consequences linked with poor social relationships. Those with low quality and low numbers of social connections have a higher likelihood of developing depression (Faust et al. 1985), social anxiety (La Greca and Lopez 1998), loneliness (Hawkley and Cacioppo 2010), and suicidal ideations (Bonanno and Hymel 2010). Increasing the quality and number of relationships can potentially mitigate the likelihood of occurrence of these negative health-related problems. More importantly, having the means to increase social intelligence would not only better one's relationships but would also improve their overall health and quality of life.

Zautra et al. (2012, 2015) developed a social intelligence training program that is delivered online and aimed at improving social relationships. Zautra et al. (2015) utilized both cognitive models and behavioral principals in their approach to defining and applying social intelligence. The online training program is comprised of 42 short videos that span 5–10 min each and are organized around seven modules and four core principles (for more information, see www.socialintelligenceinstitute.org). The videos were designed to educate individuals on the ability to effectively manage one's social relationships and navigate their social world. The online modules of the social intelligence training program focus on four core principles: (1) humanization of relationships, which describes the importance of treating one another as people with cares and concerns worthy of our attention (Zautra et al. 2015); (2) neuroplasticity, which refers to the brain's ability to form new connections; (3) uniqueness or unique nature of humans describes how we are shaped by our past experiences and expectations of the future; and (4) social intelligence is a choice and seeking connections with others is natural and in order to do so, we must first develop an

understanding of one another (Baumeister and Leary 1995; Jolliffe and Farrington 2011).

Following the development of their social intelligence program, Zautra et al. (2015) conducted a large-scale study on students at a Spanish university in Madrid. The students were provided with various materials (explained above) in an attempt to improve their social intelligence and other facets, including social cognitions and social relationship quality. Before and after the online materials, consented students were split into either a control or experimental group and were provided with a series of questionnaires aimed at assessing their emotional and social intelligence. They found that those who were in the social intelligence training program showed increases in sustainable social connectivity but also showed indications of an increased willingness to accept the perspective of others. Zautra et al. (2015) results indicated that compared to the control group, the experimental group showed significant increases in social intelligence between the pre- and post-assessments. When examining the measures of sensitivity to others, participants in the social intelligence program additionally showed increases in social sensitivity, perspective taking, social information processing, and sensitivity to others (composite score).

Based on these results, the authors concluded that the social intelligence program showed considerable promise as a way to increase the development and sustainability of positive relationships within young adults. Empirically supported through the application of social neuroscience, cognitive psychology, and social psychology, the students who participated in the program showed an increased attention to the emotions of others, displayed a willingness to take the perspective of others into account, and showed greater self-efficacy in social situations compared to the control group. Overall, Zautra et al.'s (2015) study was one of the most comprehensive evaluations of the social intelligence program. Positive results not only delineate the effectiveness of their social intelligence program but also highlight the potential for social intelligence to be altered and improved upon. In addition, their results emphasize the importance of continued research and implementation of SI programs and point to possible directions for future focus.

## Future Directions

The level of intrigue associated with social intelligence spans far and wide, having meaningful implications across a variety of disciplines. As demonstrated by Zautra et al. (2012, 2015), the social intelligence training program has the potential to improve the way individuals navigate their social world. While their study developed a solid foundation for promoting social intelligence, an important next step is to evaluate whether their results can be generalized across different groups of people. Their study found positive results in college-aged students, but can similar findings be replicated for individuals in adulthood and old age? Currently, we are attempting to answer these questions by using the social intelligence intervention program on a sample of participants in mid-life and old age (aged 45–70 years of age) (Zautra et al. 2016). Examining participants in adulthood and old age has the potential to allow for examining whether the potential for change is not limited to adolescence and young adulthood, but to adulthood and old age, where it is possible that there is potential to change. Furthermore, there is potential to examine whether intervention programs can be designed that could cater to specific samples. By tailoring intervention programs to fit particular groups of people, participants can more efficiently relate to the material being presented. Intervention programs that are designed for particular samples could result in increased motivation and ultimately, higher levels of program retention. Overall, the universal significance of social intelligences creates room to pursue future research in a variety of ways.

## Conclusion

In a society where social relationships are a crucial component of everyday life, having enduring and enjoyable social ties not only promotes happiness

but also better health. The importance of social intelligence, as explained by past research (Zautra et al. 2015, 2016; Walker and Foley 1973), is substantial and growing, providing individuals with the potential to better themselves and their relationships with others. As broad as social intelligence may be, the concept will continue to be researched across various fields for years to come.

## Definition

| | |
|---|---|
| Social learning | Social learning refers to the mechanism of an individual or collective action to change in understanding, behavior, or agenda through interaction between actors within particular networks. |
| Governance | Governance is about policymaking within a cultural and institutional atmosphere in which citizens and stakeholders interact among themselves and participate in the execution of policy to public affairs. |

## Introduction

*Social learning* (SL) is the process of social interaction between actors by which people learn behavior within a societal context. At the beginning of the learning theory, the cognition process of learning was predominant. Since the 1950s, behaviorists built a bridge between the cognitive and behavioral approach to understanding the learning process. Social learning proponents ignored group cognition process, which has been modified by the recent users of social learning perspective. The ultimate development of the social learning approach has proliferated its usages in different aspects. *Governance* is an act of governing and a process of decision-making. Thus the social learning process applies to understand the mechanism of governance as well as strengthening its implication. Governance system has been dramatically transformed throughout the twentieth century. The government was the legitimate, unchallenged agency to govern the state until the post-Second World War. During the Thatcher-Regan era, market philosophy was promoted by the privatization, deregulation, cutbacks in public spending, tax cuts, monetarist economic policies, radical institutional, and administrative reform, which is known as New Public Management (NPM) (Pierre and Peters 2000). In the NPM, the government is no longer controller of the direction of policies which urged to include private corporations in the policy-making procedure. Consequently, the state has become a weak state due to its ignorance to engage people in its policy-making procedures.

Therefore, outlines of governing in public administration have turned into more polycentric systems in which a variety of actors are engaged in local decision-making processes. This change is described as a shift from government to governance (Denters 2011), or the governance turn (Gilardi and Radaelli 2012), which means placing less emphasis on hierarchy and the state, and more on markets and networks (Bevir 2011). Due to the rising complexity and changing relationship between the state, civil society, and private organizations hierarchy as a means of coordinating common actions and decision-making is ineffective. The movement towards governance does not mean sidelining the role of government but rather increasing public participation for government to achieve its goals (McLaverty 2011; Pierre and Peters 2000). Government takes a steering role in participative decision-making by non-governmental actors who execute strategic objectives (Osborne and Gaebler 1992). The new mode of governance emphasizes the involvement of the societies in the governing process.

The consequence of the governance turn is the need for learning understood as a change

of beliefs and practices. Political and public administration decision makers have a broader scope of choices, they face questions about whether to use rule-based bureaucratic decision-making based on hierarchical governance mode, which until the turn was considered a default option, or goal-oriented public planning with quasi-market instruments, or participatory governance relying on networks. The choice between different logics implies the existence of two basic types of governance learning. The first is learning of a specific governance model. This learning is based on experience and the consequences of previous actions. It is called single loop learning (Argyris and Schon 1978), and it refines practice based on a specific logic without questioning the goal or the logic itself. It is similar to the exploitative learning, which uses existing knowledge and resources to reap value from what is already known (March 1991). Although a reflection on practices is required, there is no need for any in-depth changes in the logic of action nor the definitions of the problem. Engagement of the societies for collective action is one of the key principles of social learning, which highlights the correlation between social learning and governance.

The state was failing to implement inclusive governance. Consequently, World Bank and UNDP have prescribed the "Good Governance" approach with an objective of reforming the governance process. Good governance emphasized the active participation of citizens and civil society in the policy formulation policies. Social learning approach is very much relevant in the process of engaging individuals or groups of people in decision-making. The input of the multi-stakeholders is encouraged in the good governance process, which is also one of the preconditions of the social learning perspective. In order for the state to be functional, it should include all of the stakeholders. Otherwise, poor governance will ensue. Armstrong argues that poor governance develops "Arbitrary policymaking, unaccountable bureaucracies, unenforced or unjust legal systems, the abuse of executive power, a civil society unengaged in public life, and widespread corruption" (1994: 280). Government becomes weak while it discourages citizens or people to take part in the decision-making process. The proper social interaction between multiple actors could strengthen the governance procedure. Policymaking is one of the important tasks of government. An efficient and pro-people policy could be formulated including actors within different networks. Therefore, policy thinkers perceived social learning as an important framework for policy analysis.

The lack of participation, collaboration between actors, integration of policy legacies and environment (political, economic, sociocultural, technological, and legal) hinder the state in developing and implementing sound governance system for the betterment of its citizen. The engagement of multiple actors, meaningful interaction between them, and the integration of sociocultural, economic, political, and legal framework will be achieved through the social learning process.

## Perspectives of Social Learning

The behavioral theory of learning, based on environmental factors, was mostly applied in explaining the behavior of the people since 1930s in psychology. In the 1950s, psychologists refocus on the cognitive approach that stimulated some researchers in assimilating both behavioral and cognitive theories to interpret human behavior. The concept of social learning was developed integrating both perspectives in Miller and Dollard's work on *Social Learning and Imitation* (1941) and Dollard, Doob, Miller, Mowrer, and Sears's *Frustration and Aggression* (1950), which are some notable contributions to the idea of social learning.

Julian B. Rotter in his renowned book *Social Learning and Clinical Psychology* (1954) argued that social learning occurs in the form of expectancies and incentives. Expectancies are about the environment or how things are connected, the consequences of a person's action, and the individual's own capability to act or behave. Whereas, incentives or reinforcements are the value of the individual's behavior through

rewards and punishments. People are motivated to repeat positive behavior if the outcome of the particular behavior is awarded. In this process, a person has *Locus of Control* (ability to control individual behavior) or cross-situational belief in their own behavior. However, these suggest four indicators, which determine human behavior in the social learning process: behavioral potential, expectancy, reinforcement value, and psychological situation (Rotter 1954). Rotter also claimed that behavior is not only influenced by psychological factors but also social context and environment.

Extensive research of Albert Bandura and Richard Walters improve and popularize social learning theory by combining cognitive and behavioral learning theories. Bandura and Walters (1963), known as the leading proponent of social learning, posits that people learn by observing, imitating, and modeling the behavior of others. For example, children can learn to wash their hand by observing their parents or peers. The observer, thus, adopts new behavior by observing or modeling others and sometimes behavioral change does not occur in the learning process. Now the question is how do individuals learn from others? Bandura (1977) came up with the four-step process of learning through observation, known as the observational learning. Attention, retention, production, and motivation are involved in the social learning process. Attention is based on environmental stimuli, where individuals observe what is happening around them. By paying attention, the observer recognizes their model behavior from their surroundings. In the retention process, the observer remembers behavior of their model that occurs in their cognitive level. The individual's ability to recall is an essential factor in the retention process. Later on, the observer reproduces the modeled behavior, where physical and intellectual capabilities are crucial factors. It is known as the reproduction process which is also the part of the cognitive activity. The environment around observers motivates the reproduction process. This process is called motivation. Individual's environment and cognition play a vital role in this process. The observer changes or modifies their behaviors regarding the presence of reinforcement or punishment that others receive. Individuals are motivated to copy others' behavior if the environment rewards it. People do not reproduce modeled behavior if the model is punished for their behavior. Bandura defined this as the "vicarious learning." People tend to copy behavior of the person who is similar to them or superior to them. Children, for example, could imitate aggressive behavior if they observe such aggressive behavior in their environment. They are also imitating an individual's behavior which is rewarded by society or not punished for their behavior. For instance, children may change their aggressive behavior if it is discouraged by others.

Self-efficacy and a person's desire of developing agency over their lives are recent incorporations in the social-cognitive model of learning. Incorporating both concepts, Bandura (1973, 1986, 1989, 1997, 2001) developed the term "reciprocal determinism" to explain the complex relationship between an individual, an individual's behavior, and the environment. He equally emphasized the three factors in determining the social learning process. Cognitive ability, personality, and physical features of an individual determine both behavior and environment. Behavior also affects an individual's cognition, such as its perception, beliefs, and attitudes towards others. Equally, the environment could influence individuals and their behavior. Person, behavior, and their external environment reciprocally affect each other in the social learning process.

In the previous works, the main weakness of social learning theory was the profound focus on individual cognition rather than a group process. Recently, users and followers of the social learning approach recognized "multiple cognition" to understand the effect of collective behavior. Such as Argyris and Schon (1978, 1996), Senge (1990), and Wenger (1998) employed social entities instead of an individual comprehending the organizational learning process. Reed and his colleagues (2010) comprehensively defined social learning as a change in understanding engaging individuals who are situated within wider social units or communities of practice

through social interactions between actors within social networks. Thus, social learning changes behavior or understanding of people through the social interaction between societal actors within specific systems.

The social learning model has evolved regarding its applicability in different disciplines such as in understanding collaborative governance and the development of policy. Schusler, Decker, and Pfeffer suggested that social learning occurs through engaging people who share multiple perspectives and experiences to change their collective understanding and create a framework for collective action (2003: 311). Comprehensively, social learning is the transformation of knowledge among individuals through interaction in developing shared goals or agreement to deal with an issue (Koontz 2014: 1573–74). Muro and Jeffrey added that it is the communicative action process of changing relational, cognitive, or technical understanding through engaging multiple stakeholders (2012: 3–4). Social learning, subsequently, could be conceived as a mechanism of an individual or collective action to change in understanding, behavior, and agenda through interaction between actors within particular networks.

## The Relationship Between Social Learning and Governance

World politics and international development have undergone a radical transformation mostly because of increasing globalization. A unique characteristic of this transformation is the increasing number and type of stakeholders organized into interest groups or nongovernmental organizations (NGOs). Their influence on public policy at the local, national, and global levels and in nearly every aspect of policymaking and international relations has made them dominant actors in the development arena (Lewis 2003). Social learning is the process of changing behavior through reciprocal interaction between the person, behavior, and its environment.

Similarly, governance is the process of governing and formulating policies through reciprocal interaction between actors, policy, and environment. State or governance is also an actor in this mechanism. There are two types of actors in the governance procedure. Real actors include presidents, prime ministers, bureaucrats, civil society, citizens, and media whereas amorphous actors are structures, international markets, interests, international regimes, or policy networks (Pierre and Peters 2000). All real and amorphous actors are essential in formulating the inclusive public policy. State is dependent on all these actors for governing, executing, legislating, and implementing public policy because the government does not have sufficient resources for delivering its public services. In this regard, the sociocultural, economic, political, technological and legal frameworks of the state are the key environmental factors which have reflective effects on the governance process. Instrument, values, goals, efficacy, and legacies of policy or decision also have a major impact on governance. The policy or decision reciprocally motivates stakeholders or actors and environment in penetrating new form of governance and its effectiveness.

Development of the new mode of governance reflects the complex interaction of actors, decisions made by those actors, and the environment. The relationship between these elements is known as "reciprocal determinism" (mutual collaboration). Knowledge, expectations, beliefs, and attitudes of the actors or stakeholders affect both their decision and the environment. Likewise, previous decisions made by the stakeholders can influence the knowledge, experiences, expectations, beliefs, and attitude of the actors. Knowledge, expectations, beliefs, and attitudes of the actors are also developed based on their sociocultural, political, economic, and legal context. Equally, decisions or policies formulated by the actors could affect the environment of the state. Interactions between actors, policy, and environment that are reciprocal are instigated in the social learning model. Social learning emphasizes the interaction between multiple actors in making any decision regarding the state. States should consider their all stakeholders to decide on governing the state. All stakeholders

should have input to develop a comprehensive policy. States are responsible for coordinating the inclusion procedure and consideration of the suggestions of multistakeholders in governance. Governance is noninclusive and ineffective without proper collaboration between actors, which are the preconditions of social learning. In this circumstance, governance could be improved through achieving reciprocal interaction between actors, policy, and environment of the state.

In the social learning model, individuals have "locus of control" over their competence (or behavior) while behavior and environment also influence them. State actor has a locus of authority (control over their system) in execution, legislative procedure, and policy implementation, (Pierre and Peters 2000) but this locus of power is affected by its environment and delaying policies as well as their goals, values, legacies, and efficacy.

Social learning occurs regarding four processes: attention, retention, production, and motivation which are similar in the governance process. States do not rethink their governance unless it considers problems are occurring in the sociocultural, political, economic, and legal environment. In the retention process, states not only detect these problems but also solutions to those complications. Retention process depends on actors' skills, knowledge, and capability to observe the environment and resolve the complications. In this third stage, stakeholders make an effective decision to address such irregularities, which are influenced by both actors and their environments. It is known as the production or reproduction process in the social learning approach that seemly interprets the governance process. Motivation is the final stage of learning which refers to reinforcement or punishment. Incentives, suggested by Rotter, are also related to reinforcement and punishment. Positive outcome of the newly making decisions encourage implementing the reproduced policies. Negative outcomes prevent executing these decisions. Bandura defined this process as the "vicarious learning." For example, Western policies are imposed in the developing country; however, prevailing environments of the developing countries determine their effectiveness. Expectations of the actors or stakeholders are important determinants of their decisions. Stakeholders assess the relevance of these policies to their local environment; outcomes of these policies and their capabilities to incorporate and implement policies in the governance process.

Policy thinkers employed social learning as an approach to policy analysis. Hugh Heclo and Peter Hall are prominent policy analysts who applied social learning approach to understanding the changes of policies in the Western world, such as the United Kingdom and Sweden. Heclo argued that social policymakers resolve policy problems in the form of collective puzzlement on behalf of the society. Social learning occurs in two different forms: classic conditioning and instrumental conditioning. "Classical conditioning" is the mode of policymaking where policymakers amend existing policies regarding its necessity with the process of puzzling. They do not conduct intensive research to make such minor adaptations.

Conversely, "instrumental conditioning" is the process of radical change in the policy framework through questioning their existing policies (Heclo 1974). He asserts that a change in the government is helpful for implementing this policy. Thus, learning could be essential in both minor adaptations in the policy and replace existing policies ensuring better policy for governing the state. Policymaking process in the United Kingdom and Sweden have taken by Heclo explaining the collective puzzlement and learning process in the policymaking.

Heclo's work on the policy adaptations regarding social learning encouraged Peter Hall. Hall formulated a model of social learning to explain the macroeconomic policy change in the UK. He argued that social learning is an active mechanism for adapting the goals and strategies of policy based on the underlying experiences, knowledge, and new information as well. He suggested that state policymakers are engaged in the model of social learning which has three key features. First, policy legacies predominantly influence the goals of policymakers where past is more prevalent than the existing socioeconomic conditions. Bureaucrats and elites, therefore, are

the main source of learning rather than politicians in this process. Second, elected officials and civil servants promote policies as they are more knowledgeable in the specific area. Both of these features follow Heclo's classic conditioning where technocrats play a pivotal role to adjust policies. Finally, the capacity of states to function without considering the ideas of multiple actors is prevalent in the social learning approach related to self-efficacy (Hall 1993).

According to these features, Hall argued that particular approaches to learning are related to three types of policy changes. Policymakers change or adjust to policies in a routine process that considered as the first-order learning similar classic conditioning. In second-order change, policymakers pursue changes in policy not goals of their policy. The third-order change or learning is associated with the abandonment of the policy goals that is known as a paradigm shift in the policy (Hall 1993). This change occurs in response to the failure of existing policies. Hall exemplified the Thatcher-Regan's era where John Maynard Keynes's welfare economic approach was replaced with monetarism or neo-liberalism in the United Kingdom and the United States of America since the 1970s. Failure in policy forced policymakers to abandon a policy paradigm and accept a new one. Locus of authority (government) also changes in the new policy paradigm. In response to Hall, Michael Oliver suggested a fourth-order change or "learning to learn" that could be a framework of understanding first-, second-, and third-order learning emphasizing on how policymakers learn, and we can understand their capacity to make a change in policy (Oliver 1997).

Governance is related to the transformation of relationships between state and society, depending on less coercive policy instrument to govern the state (Pierre and Peters 2000). In the emerging form of governance, states have no more locus of power and control instead it coordinates and facilitates other powerful actors in the society. As a result, states are crawling to overcome their persistent constraints and making the proper solution for its betterment. It could be defined as wicked problems such as constraints, lack of resources, and lack of collaboration among actors (Pierre and Peters 2000). Social learning will be the practical framework to get rid of this wicked problem. Actors or stakeholders should learn from their past experiences and develop a better understanding of how governance process is related to its environment (Hall 1993). Effective multistakeholders' interaction creates a collaborative platform which is needed to overcome these constraints. Actors should understand the management of the political and decision-making context, as well as provide access to other stakeholders giving inputs in the decision-making process. Structural openness or flexible environment will enhance the interaction between social and political stakeholders in the sociopolitical governance process (Faysse et al. 2014; Koontz 2014; Schusler et al. 2003). Ultimately it reduces the structural unpredictability bearing legacies of past policies and decisions. The process of interaction and decision-making will define the expectations, systems, and management in this governance process. These preconditions are prerequisites in resolving the underlying policy problems. Social learning, therefore, enables actors in making effective decisions and pathways to eradicate wicked problems of the governance.

The experts do not solve public problems instead should be solved through dialogue and deliberation between multiple stakeholders. Collaborative governance is the key to solve these problems (Siddiki et al. 2017). The social dimension of governance by academia and civil society demand active and meaningful participation of the multiple actors in the decision-making process. A citizen could play an active role in shaping public policies and framing solution. Engagement of the common people in the policymaking will be an important step towards collaborative governance. Efficacy of governance depends on proper interaction, collaboration, and involvement of multiple actors in decision-making. Collaborative governance becomes effective when people engage with one another and share their diverse perspectives and experiences to develop a standard policy for action (Faysse et al. 2014; Koontz 2014; Schusler et al. 2003).

As a result, actors recognize the distribution of power and dependency maintaining organizations and social relationships which will manufacture the identification ability of power fixation and accordance among the organizers to generate a collaborative output. The participation of the citizens could ensure trust, increase transparency and improve accountability in the collaborative process (Siddiki et al. 2017). The application of social learning approach is most prevalent and successful in the collaborative governance, such as in environmental governance, natural resource management, and organizational management (Faysse et al. 2014; Folke et al. 2005; Koontz 2014; Olsson et al. 2007; Schusler et al. 2003; Termeer et al. 2010).

States initiate new policies because of the poor and weak governance of the delaying public policies. Weak governance results from the lack of reciprocal interactions between actors. Limited capacity to interact and the interests of the stakeholders could also be the reason for poor governance. With a reform objective of the economic and political dimension of governance, World Bank and UNDP prescribed "good governance" which emphasize on the rule of law, transparency, consensus-oriented, equity and inclusiveness, effectiveness, effectiveness and efficiency, accountability, and participation. Nowadays, the World Bank and UNDP suggest installing e-governance to combat corruption and ensure good governance. Social learning is also useful in implementing e-governance. Different stakeholders of the e-governance should have comprehensive knowledge about the existing environment and learn how to deliver public services through the internet in the environment. Literacy could be an issue regarding e-governance whereas all stakeholders may not have the efficacy of distributing and using services. Outcomes of the e-governance also depend on the collective-efficacy of the actors and the collaboration between e-governance policy, and environments. The state should build efficacy for e-governance, and it could collaborate for developing efficacy and desirability of the providers and users of e-governance. Otherwise, e-governance, a new instrument for good governance, will also be an ineffective instrument of governance. Good government is essential to ensure good governance who implies uniformity of services across the entire political unit (Pierre and Peters 2000). Uniformity of the services is possible only developing uniformity among multiple stakeholders that is asserted by the social learning model. Communicative action is essential to overcome prevailing constraints where multiple stakeholders develop mutual understanding through dialogue and deliberation (Faysse et al. 2014). Social learning proposes to ensure proper interaction between all actors that will create uniformity of decision as well as the uniformity of services.

## Conclusion

The mechanism of social learning is a significant apparatus to understand and explain the reciprocal interaction between all elements of the governance process. Multiple actors from different cohorts of the society should interact making a representative, uniform, and practical decision for resolving wicked problems and strengthening governance. This collaborative practice is defined as "process" and acknowledged as one of the dimensions of sound governance by Riggs (1994). The state should be careful about the dominance of particular stakeholders in this interaction who could interrupt the collaborative process. Environments (sociocultural, economic, political, legal framework) and policy (both existing and previous) along with their values and goals are also important determinants of true governance. Riggs also argued that the legitimacy of the governance process stems from its "structure" such as a body of constitutive elements, actors, rules, regulations, procedures, decision-making frameworks, and authoritative sources. Also, he has emphasized in considering the "cognitive and value dimension": unique or deviant value system of the governance structure. The key elements of the governance process: all stakeholders, policy values, and goals, as well as the external environment of the state are crucial factors which determine collaborative governance

through reciprocal interaction between them. Some of the critics claim that social learning stems from the historical institutionalist approach which emphasizes the influence of institutions based on the external environment to instigate policy change instead of focusing on the action of policymakers. Nevertheless, the emergence of a new mode of governance, wicked problems, powerlessness and failure of the state, and weak governance are attributable by the social learning approach which emphasizes on the reciprocal interaction between stakeholders, policy, and environment. Thus, Greener (2001) defined social learning in terms of the governance as a process by which policymakers adapt their learning and practices to changes in their environment and consequently how these adjustments become indicators in the policy reproduction.

# Social Media and Government Employees in Tanzania

Julius Raphael Athuman Mhina
Department of Computer Science, Institute of Finance Management, Dar es Salaam, Tanzania

## Synonyms

Electronic government; Government employee; Social media; Tanzania; Web 2.0

## Definition

Social media are Internet applications whose contents is collaboratively generated by developers and users. Web 2.0 is a second generation of web. Its main features include collective creation of web contents between producers and consumers.

## Introduction

The emergence of web 2.0 and social media in the past decade is associated with the developments in ICT which has made it possible for many people to possess mobile phones and have access to mobile-broadband. Out of 7.593 billion world population, 5.135 (68%) billion are unique mobile users, 4.021 (53%) billion are Internet users, 3.191 (42%) billion are active social media users, and 2.958 (39%) billion are active mobile social media users (Kemp 2018). Reports suggest that many Internet users spend a lot of time online with average user spending up to 6 h per day online and particularly on social media such as Facebook, Instagram, Twitter, YouTube, WhatsApp, etc.

In what can be seen as an attempt to follow the citizens, many Government Institutions around the world have adopted official use of social media. They do so by maintaining official social media accounts on social media and web 2.0 applications such as Facebook, Instagram, YouTube, etc. However, studies show that the government institutional accounts are less active and less popular than those owned and managed by individual institutional employees (Mickoleit 2014; van Zoonen et al. 2014). In this regard therefore, scholars suggest that, in order to attract more users and keep the accounts up to date, the institutions are advised individualize their social media accounts by encouraging their employees to engage in work-related use of their social media accounts (Kuzma 2010). This implies that employees working in the government institutions are encouraged to use their personal social media accounts to post and share work-related messages.

However, the factors that influence employees' acceptance of social media for work-related use are generally not known. To fill up this gap, a survey was conducted on Tanzania government employees who are based in Ministries, Departments and Agencies (MDAs), in order to assess the factors that influence acceptance and work-related use of social media among government employees and develop a model for professional use of social media among government employees. To undertake this study, the famous Theory of Acceptance and Use of Technology (UTAUT) was adapted and integrated with other factors as suggested by the literature.

**Social Media and Government Employees in Tanzania, Fig. 1** The unified theory of Acceptance and Use of Technology (UTAUT). (Source: Venkatesh et al. 2003)

This entry proceeds as follows; the next section describes the theoretical framework and proposed model of study, followed by methodology, analysis of the results, discussion and conclusion, and finally references.

## Theoretical Framework

The study adapted the prominent Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh et al. 2003).

UTAUT (see Fig. 1) is a unified model for adoption of information systems which was developed from other eight technology adoption models. It was developed with the aim of providing a standard theoretical framework for individual adoption of technology in organizations by combining the following theories/models: Theory of Reasoned Action (TRA), Technology Acceptance Model (TAM I-III), Motivation Model (MM), Theory of Planned Behavior (TPB), Combined TAM and TPB (Combined TAM-TPB), Model of Personal Computer Utilization (MPCU), Innovation Diffusion Theory (IDT), and Social Cognitive Theory (SCT) (Venkatesh et al. 2003). The UTAUT showed highest total explained variance on Behavior Intention (BI) (70%) and on Use Behavior (UB) (53%) among the eight combined models (Venkatesh et al. 2003). The theory constructs and their originating models are defined in Table 1 and described in Fig. 1.

|---|---|
| Performance expectancy (PE) | The degree to which an individual believes that using the system will help him or her to attain gains in a job |
| Effort expectancy (EE) | The degree of ease associated with the use of the system |
| Social influence (SI) | The degree to which some individual feels that it is important for others to believe he or she should use the new system |
| Facilitating conditions (FC) | The degree to which an individual believes that organizational and technical infrastructure exists to support use of the system |
| Hedonic motivation (HM) | Perceived enjoyment associated with the use of a technology or system |
| Perceived image (PI) | The perception or belief that, using the system or technology at hand will enhance one's image in the society |
| Perceived risks (PR) | The anticipated negative consequences of using the system or technology |
| Attitude (AT) | The evaluative negative or positive feelings of using the system or technology |
| Behavioral intention (BI) | The measure of one's intention to perform a specified behavior |
| Use behavior (UB) | This is the actual engagement on the behavior |

Among eight models, UTAUT had far better ability to explain the variance in intention behavior (70%) and actual performance of the behavior (53%) making it a superior model among most of the prior technology adoption models (Venkatesh et al. 2003).

S

The theory posits that user's decision to perform a behavior (Use Behavior) is determined by the person's intention to perform the behavior (Behavior Intention) and the intention is jointly determined by the individual's internal beliefs of usefulness of the systems (Performance Expectancy), effort required to use the system (Effort Expectancy), and influence from important other people (Social Influence). Furthermore, the theory posits that availability of technological and organization support (Facilitating Condition) has direct influence on both Behavior Intention and Use Behavior. These constructs are described in Table 1. Also, UTAUT posits that there are four moderating variables: Gender, Age, Experience, and Voluntariness to use. A moderating construct is a factor that modifies either the strength or form of the relationship between the dependent and independent variable.

Although the aspirations of developing UTAUT were to establish a standard model for adoption of technologies, however, subsequent studies suggested a need to refine the model (Venkatesh et al. 2016). This was due to an increasing number of scholars showed need to extend the theory by adding other constructs to the model in order to suit requirements.

## UTAUT Extension

In response to the call by Venkatesh et al. (2016) to refine the model, this study conducted a review of the literature and suggested four new factors to be included in the UTAUT model in order to enhance its predictive power in assessing the factors that influence adoption of new technology and, in particular, the social media. The following factors were proposed as an extension to the UTAUT model, i.e., Hedonic Motivation (HM), Perceived Personal Image (PI), Perceived Risks (PR), and Attitude (AT) (see Fig. 2).

### Hedonic Motivation (HM)

Hedonic motivation is defined as perceived enjoyment or pleasure obtained when using the system (Venkatesh et al. 2012). Studies show that perceived enjoyment influences adoption of technology. Venkatesh et al. (2012) mentioned that hedonic motivation is an important antecedent of

**Social Media and Government Employees in Tanzania, Fig. 2** Proposed research model

intention to adopt new technology. Also, studies show that, hedonic motivation enhances the attitude of users of technology such that if a technology is believed to be enjoyable, the users develop positive attitude toward the technology.

### Perceived Personal Image (PI)

In this study, *Perceived Personal Image* is defined as the degree to which an employee believes that using social media gives him/her ability to improve his or her social status in the eyes of fellow employees and general public. It is the degree to which use of an innovation is perceived to enhance one's image or status in one's social system (Moore and Benbasat 1991). Social media enable employees to engage rapidly and simultaneously with peers, colleagues, customers, and the general public thereby offering possibilities to convey a favorable image of the self (van Zoonen et al. 2014). Studies show that self-identity has effect on both attitude and intention to engage in behavior (Mhina and Johar 2017).

### Perceived Risks (PR)

Perceived risk is defined as perception of uncertainty regarding possible negative consequences of using a product or service (Featherman and Pavlou 2003). In many studies, perceived risk is studied as a composite factor comprising of a number of risks such as privacy risks, performance risks, social risks, and security risks (Featherman and Pavlou 2003). Perceived risks are closely related to anxiety or worry associated with using a certain technology of a product.

Studies show that use of social media is a concern to many organizations due to security and privacy concern of their organizations. Employees' usage of social media could lead to exposure of potentially sensitive and exploitable organization information and that the network security of an organization could be jeopardized due to possibility of social media accounts of employees being compromised by cyber attackers and hijackers who then could launch a cyber-attack to the organization taking advantage of security vulnerabilities prevalent on social media through such techniques as phishing scams. However, UTAUT model did not take into consideration perceived risks such as security and privacy risks which empirical studies have showed that they have negative influence on the adoption of information systems. Therefore, this study integrates perceived risks with the UTAUT model in order to investigate its influence on the acceptance and work-related use of social media among government employees. Studies show that PR has negative effect on Attitude, Intention to use technology and actual use of technology.

### Attitude (AT)

Attitude is defined as "an individual's positive or negative feelings (evaluative affect) about performing the target behavior" (Fishbein and Ajzen 1975, p. 216). It involves an individual's judgment that performing a behavior is good or bad and also a general evaluation that an individual is inclined or disinclined to perform the behavior. This construct was not included in the UTAUT model with justification that in the existence of PE and EE, this construct was found to be spurious implying that AT has no significant contribution on the explanatory power of a model when it coexists with PE and EE (Venkatesh et al. 2003). However, since the development of UTAUT, a number of studies have found Attitude to be an important factor in combination with other UTAUT constructs and hence contradicting the Venkatesh et al. (2003) finding. Furthermore, attitude was also found to be influenced by PE, EE, SI, and FC. Attitude was found to have significant effect on BI and on UB (Dwivedi et al. 2017a). This study therefore, integrated UTAUT with attitude in order to validate its effect in the acceptance and use of social media among Tanzania government employees.

## Proposed Research Model

The proposed research model (Fig. 2) therefore consisted often (10) constructs, namely: Performance Expectancy (PE), Effort Expectancy (EE), Social Influence (SI), Facilitating Conditions (FC), Hedonic Motivation (HM), Perceived Personal Image (PI), Perceived Risks (PR) Attitude (AT), Behavior Intention (BI), and Use Behavior (UB).

**Social Media and Government Employees in Tanzania, Table 2** Research hypotheses

| Hypothesis number | Statement |
|---|---|
| H1 | PE positively relates to BI |
| H2 | EE positively relates to BI |
| H3 | SI positively relates to AT |
| H4 | SI positively relates to BI |
| H5 | FC positively relates to AT |
| H6 | FC positively relates to UB |
| H7 | HM positively relates to AT |
| H8 | HM positively relates to BI |
| H9 | PI positively relates to AT |
| H10 | PI positively relates to BI |
| H11 | PR negatively relates to AT |
| H12 | PR negatively relates to BI |
| H13 | PR negatively relates to UB |
| H14 | AT positively relates to BI |
| H15 | AT positively relates to UB |
| H16 | BI positively relates to UB |

While the UTAUT relationships are shown using thick lines, the added constructs are written in *italic*. In the proposed model, Behavior Intention (BI) is postulated to be determined by PE, EE, SI, HM, PR, and AT. AT on the other hand is determined by SI, HM, PR, and FC. Furthermore, the UB is determined by BI, PR, FC, and AT.

The research hypotheses shown in Fig. 2 are summarized in Table 2. All independent variables are positively related to the dependent variables except variable PR which is negatively related to the independent variables. All hypotheses were developed based on previous studies. All variables on the left side of the arrow are independent variables and those variables on the right side of the arrow are dependent variables.

## Research Methodology

### Population, Sample Size, and Sampling Technique

The population for this study is government employees based in Tanzania Ministries, Departments and Agencies (MDAs). These employees were selected because they were considered the key people toward implementation of government policies. Depending on the findings of the study, the government policies can be developed or reviewed to enhance beneficial usage of social media among government employees. Since the population size is finite and known, the Yamane formula (Yamane 1967) was used to calculate the sample size for the study which yielded 400 as adequate minimum sample. For this study, a Quantitative technique (Creswell 2014) using self-administered questionnaire (Kumar 2011) was employed. The convenient sampling technique was used to distribute questionnaire to 1061 employees of 9 Ministries, 18 Government Departments, and 5 Agencies based in Dar es Salaam city, Tanzania, resulting into 675 (63.6%) return ratio. However, the final data set consisted of 600 cases after data screening. The data collection exercise was conducted between January 2016 and March 2017. Before the actual data collection, a pilot study was conducted to fine tune the instrument.

### Instrument Design and Development

The initial measurement instrument used in the study consisted of 59 items with all of the items adapted from the literature. While the items for the constructs for the following constructs – Performance Expectancy (PE), Effort Expectancy (EE), Social Influence (SI), Facilitating Conditions (FC), Attitude (AT), and Behavior Intention (BI) – were adapted from Venkatesh et al. (2003). A 7-point Likert scale was adapted in this study with scores ranging from 1– Strongly Disagree to 7–Strongly Agree. The final questionnaire consisted of 42 items (see Fig. 3).

### Study Procedure

Table 3 shows the home or personal usage of social media by respondents. Respondents were presented with a list of most popular web 2.0 and social media applications in Tanzania and were asked to indicate the application (s) they use for personal purposes whereby the most popular social media among the respondents is WhatsApp (21.1%) which is used by 555 (92.2%) respondents, Facebook is the second most used application (16.4%) used by 432 (71.8%) respondents, YouTube (14.2%) ranked third and is used by 408 (61.2%) respondents, Instagram (12.4%) used by 356 (53.4%) respondents, Twitter

**Social Media and Government Employees in Tanzania, Fig. 3** Final measurement model

(7.6) used by 219 (32.8%) respondents, LinkedIn (6.4) used by 185 (27.7%) respondents, Google+ (6.9%) used by 199 (29.8%) respondents, and Blogs (6.2%) used by 179 (26.8%) respondents. An almost negligible number of 5 (0.2%) respondents indicated that they don't use any social media for any purpose. Those respondents who used at least one application for home or personal purposes were

S

asked to indicate their perception on the web 2.0 and social media applications and their willingness to use them for professional or work-related purposes.

The respondents were also asked to indicate how they use social media for personal purposes. As shown in Table 4, the respondents indicated that they use their personal social media mostly for sharing messages with friends (34.70%), personal networking (23.40%), entertainment (21.10%), to contribute on online blogs (15.70%), and other purposes (5.20%).

In order to determine their perception on use of their personal social media accounts for work-related or professional purposes, the respondents were asked to indicate their perceptions by responding to questionnaire items developed based on the model variables. The analysis of the responses and findings are discussed in the next sections.

## Results and Analysis

To analyze the collected data, Structural Equation Modelling (SEM), a multivariate statistical analysis technique was employed. This is because this technique is able to analyze all inter-relationships simultaneously (Hair et al. 2010). A two-stage analysis was adapted, starting with analysis of the measurement model through confirmatory factor analysis followed by analysis of the structural model. Both IBM AMOS version 21 and IBM SPSS version 21 tools were used to facilitate the analysis process.

### Descriptive Analysis

Table 5 shows demographic characteristics of the sample with 209 (31%) respondents coming from Ministries, 331 (49%) respondents from government departments, and 135 (20%) from government

**Social Media and Government Employees in Tanzania, Table 3** Respondents' social media usage ($N = 675$)

| Preferred social media | Frequency | Percentage (%) | Percentage (%) of cases |
|---|---|---|---|
| WhatsApp | 613 | 21.40 | 91.90 |
| Facebook | 474 | 16.50 | 71.10 |
| YouTube | 408 | 14.20 | 61.20 |
| Instagram | 356 | 12.40 | 53.40 |
| Twitter | 219 | 7.60 | 32.80 |
| Google Plus | 199 | 6.90 | 29.80 |
| LinkedIn | 185 | 6.40 | 27.70 |
| Blogs | 179 | 6.20 | 26.80 |
| Skype | 177 | 6.20 | 26.50 |
| WeChat | 33 | 1.20 | 4.90 |

agencies. The youth age group (18–35) contributes more than half of the sample 376 (55.7%). Majority of the respondents are males 338 (57.7%). More than half of the respondents have a bachelor degree 369 (54.7) and 545 (80.8%) have high experience ($\geq$ 3 years) in using social media for personal purposes.

## Missing Data, Normality, and Outlier Assessment

Data screening was performed on the collected data for detection of missing values, normality, and outliers in order to produce valid and reliable results. This process resulted in deletion of 75 cases due to high missing rate (more than 5%) and suspicious pattern such as non-engagement. The remaining data with missing values (less than 5%) were imputed using median (Gaskin 2016). The data screening process resulted into 600 (88.9%) usable cases which were used in all subsequent analyses.

Univariate normality was tested by using Skewness and Kurtosis. The results of the analysis are as shown in Table 6 in which the Skewness and Kurtosis values of all items were within the acceptable value of $\pm 2$ for Skewness and $\pm$ 3 for Kurtosis (Awang 2016).

## Measurement Model

This study adapted the two-step approach in conducting analysis, i.e., analysis of the measurement model followed by the analysis of the structural model. The analysis of the measurement model is conducted in a validation process called Confirmatory Factor Analysis (CFA). This was done using the Analysis of Moments of Structure (AMOS) software. The purpose of this process is to validate the measurement model for reliability and validity of measured items before the relationship between constructs was analyzed in structural equation model (Hair et al. 2010).

For a model to be considered good, its $\chi$-square ($\chi^2$) is supposed to be nonsignificant ($p > 0.05$), implying that there is no significant difference between the data and the proposed model (Hair et al. 2010). However, $\chi$-square is known to be sensitive to model complexity and sample size hence not always an indication of a good model; therefore a normed $\chi$-square ($\chi^2$/df) is used in instead of $\chi$-square with a value of less than 3 considered adequate. In order to overcome this bias introduced by $\chi$-square, additional model fit indices are used as recommended. For this study, the following model fit indices were used to assess both the measurement model and structural model for this study: A normed $\chi$-square ($\chi^2$/df), Root Mean Square Error of Approximation (RMSEA), Standardized Root Mean Residual (SRMR), Comparative Fit Index (CFI), and *Tuller-Lewis* Index (TLI). The thresholds for acceptance values of the indices are shown in Table 7.

Cronbach's alpha ($\alpha$), Composite Reliability (CR), Average Variance Extracted (AVE), and Maximum Shared Variance (MSV) were all used to assess reliability, discriminant validity, and convergent validity of the measurement model. For reliability to be achieved, $\alpha > 0.7$ and CR should be $\geq 0.6$ or preferably $> 0.7$, for convergent validity to be achieved; AVE $> 0.5$ and for discriminant validity to be achieved MSV $<$ AVE

**Social Media and Government Employees in Tanzania, Table 6** Constructs reliability and validity

| Construct | PE | EE | SI | FC | HM | PR | PI | AT | BI | UB |
|---|---|---|---|---|---|---|---|---|---|---|
| VIF | 1.696 | 1.469 | 1.634 | 1.746 | 1.678 | 1.445 | 1.746 | N/A | N/A | N/A |

| Construct | PE | EE | SI | FC | HM | PR | PI | AT | BI | UB |
|---|---|---|---|---|---|---|---|---|---|---|
| Performance expectancy | **0.819** | | | | | | | | | |
| Effort expectancy | 0.558 | **0.751** | | | | | | | | |
| Social influence | 0.504 | 0.234 | **0.769** | | | | | | | |
| Facilitating conditions | 0.575 | 0.506 | 0.548 | **0.723** | | | | | | |
| Hedonic motivation | 0.442 | 0.279 | 0.541 | 0.599 | **0.900** | | | | | |
| Perceived risks (PR) | −0.057 | 0.150 | −0.291 | −0.126 | −0.247 | **0.742** | | | | |
| Perceived image | 0.338 | 0.105 | 0.532 | 0.408 | 0.489 | −0.651 | **0.735** | | | |
| Attitude | 0.262 | 0.047 | 0.438 | 0.419 | 0.528 | −0.555 | 0.702 | **0.856** | | |
| Behavior intention | 0.272 | 0.032 | 0.490 | 0.390 | 0.446 | −0.547 | 0.718 | 0.827 | **0.943** | |
| Use behavior | 0.312 | 0.053 | 0.549 | 0.384 | 0.484 | −0.592 | 0.714 | 0.778 | 0.809 | **0.91** |

(Hair et al. 2010). Table 6 shows that all the CR for all constructs ranged from 0.77 (FC) to 0.96 (BI), the AVE ranged from 0.52 (FC) to 0.89 (BI) and all MSV < AVE. Furthermore, √AVE which is shown as the diagonal value (**in bold**) (See Table 8) is greater than all values along the row and column for all constructs, hence discriminant validity is achieved (Awang 2016).

In order to test for multicollinearity, SPSS was used to calculate tolerance and Variance Inflation Factor (VIF). A value of tolerance greater than 0.1 and VIF of less than 3.0 are considered good indication of absence of multicollinearity (Pallant 2010). Since all VIFs were < 3 and Tolerance >0.1, then it is concluded that there is no multicollinearity in the sample (see Table 6).

Based on this assessment, it is evident that the convergent validity, reliability, and discriminant validity of the constructs have been achieved; therefore, the assessment of the structural model is done in the next section.

## Structural Model

The same criteria that were used to assess goodness of fit of the measurement model were used to assess the goodness of fit (GOF) of the structural model. Both models showed similar model fit results (see Table 4). Since the measurement model showed

**Social Media and Government Employees in Tanzania, Table 9** Path significance and hypotheses testing results

| HNO | Path | Beta (β) and *t*-values | Hypothesis testing results |
|---|---|---|---|
| H9 | PI→AT | 0.425*** | Supported |
| H7 | HM→AT | 0.231*** | Supported |
| H11 | PR→AT | −0.217*** | Supported |

| H15 | AT→UB | 0.251*** | Supported |
| H16 | BI→UB | 0.458*** | Supported |
| H6 | FC→UB | 0.101** | Supported |
| H13 | PR→UB | −0.194*** | Supported |
| $R^2$ for UB | | 0.72 | |
| $R^2$ for BI | | 0.73 | |
| $R^2$ for AT | | 0.57 | |
| $R^2$ for PI | | 0.59 | |

Notes: *HNO* hypothesis number, *PE* performance expectancy, *EE* effort expectancy, *SI* social influence, *FC* facilitating conditions, *HM* hedonic motivation, *PI* perceived personal image, *PR* perceived risks, *AT* attitude, *BI* behavior intention, *UB* use behavior, significance of paths: $*p < 0.05$, $**p < 0.01$, $***p < 0.001$, *NS* not significant ($p > 0.05$), $\beta$ standardized path coefficient, $R^2$ explained variance

good model fit ($\chi^2/df = 2.224$, $RMSEA = 0.045$, $SRMR = 0.0387$, $CFI = 0.970$, $TLI = 0.963$), therefore path analysis can be done.

The structural model results show that 10 (11) out of 14 (16) standardized path coefficients were significant hence the proposed research model (Fig. 2) was largely supported. The structural model results are shown in Table 9.

## Discussion and Implication

The aim of this study was to validate UTAUT and integrate it with Hedonic Motivation (HM), Perceived Personal Image (PI), Perceived Risks (PR), and Attitude (AT) in order to investigate the antecedents of acceptance and work-related use of personal social media accounts among Tanzania government employees.

The results of structural model analysis showed that there is need to refine the proposed model since not all the hypothesized relationships in Fig. 2 were confirmed. Furthermore, in the course of analysis, there are new relationships which emerged and which were found to be meaningful. The final model (see Fig. 4), therefore, is refined to include only supported hypotheses together with emerged significant relationships but excluding all unsupported relationships. Two UTAUT constructs were eliminated from the final model which is Performance Expectancy and Effort Expectancy as a result of the model refinement process due to the hypotheses related to these constructs being unsupported.

The final model consists of eight (8) core constructs, namely: – Social Influence, Facilitating Conditions, Hedonic Motivation, Perceived Risks, Perceived Personal Image, Attitude Behavior Intention, actual Use Behavior, and three

**Social Media and Government Employees in Tanzania, Fig. 4** Developed model

(3) moderating variables, namely, gender, age and social media experience (see Fig. 4).

The model showed that the added constructs, namely, hedonic motivation, perceived personal image, perceived risks, and attitude are highly significant and significantly improved the model performance as shown by the explained variances on attitude, behavior intention, and actual use. As such, these factors proved to be important antecedents for acceptance and use of social media among Tanzania government employees. The results of the analysis are summarized in Fig. 4.

The results showed that attitude is the strongest determinant of intention and actual use of personal social media for work-related purposes among the respondents. Our results are consistent with those of previous studies (van Zoonen et al. 2014; Dwivedi et al. 2017a).

The results showed that perceived personal image has largest standardized total effect on the actual use followed by social influence in the second place and attitude in the third place. Surprisingly, BI is the least of the factors influencing actual use. The influential effect of AT on actual use is consistent with Dwivedi et al. (2017b).

However, our results could not confirm effect of Performance Expectancy (PE) and Effort Expectancy on Behavior Intention consistently with Mandal and Mcqueen (2012), and Mandal and Mcqueen (2012), Lallmahomed et al. (2013), and Liu and Chang (2016), who obtained similar results regarding PE and EE, respectively.

Regarding social influence, our results confirmed its effect in the intention to adopt work-related use of personal social media accounts among respondents consistent with other previous studies (Venkatesh et al. 2003; Venkatesh 2012; Dwivedi et al. 2017a; Raphael and Johar 2017). This suggests that the decision of respondents to use personal social media for work-related purposes is influenced by others.

On the other hand, the results showed that facilitating conditions directly affects the actual use of decision of social media for work-related purposes consistently with other previous studies (Venkatesh et al. 2003; Dwivedi et al. 2017a). This implies that availability of favorable organizational infrastructure such as supportive policies do influence the decision of respondents to engage in use of personal social media accounts for work-related purposes.

Lastly, the results confirmed negative effect of perceived risks on attitude, behavior intention, and actual use as hypothesized earlier. This implies that, while government employees are extensively using the technolgies for home or personal purposes as shown in Table 1, nevertheless they are worried about using the technolgies for work-related purposes due to perceived risks

such as security risks, privacy, and other risks. Therefore, if the government organizations want to encourage use of web 2.0 and social media among their employees, they need to improve their attitude toward the using the technolgies.

Overall, our results show that the acceptance and use of personal social media accounts for work-related purposes among Tanzania government employee is influenced by the contextual factors (facilitating conditions and social influence) and the individual or psychological factors (hedonic motivation, perceived personal image, perceived risks, and attitude) and not by the system attributes, i.e., performance expectancy and effort expectancy which in this case did not play any salient role in the intention of the employees to engage in the behavior.

This study is an important step toward understanding the factors that influence government employees' acceptance and use of their personal social media accounts for work-related purposes. It is an important effort to understand how use of social media among employees may be used in a productive way. The study validated and modified a well establish theory of acceptance and use of technology (UTAUT) integrating it with other factors in a quantitative study.

As a main contribution, this study makes a significant contribution to the development of theory by validating UTAUT and extending it with the new factors: Hedonic Motivation, Perceived Personal Image, Perceived Risks, and Attitude. All these factors proved to be influential in the acceptance and use of social media for work-related purposes among government employees.

**Social Media and Government Employees in Tanzania, Table 10** Descriptive analysis of constructs

| Construct | Mean ($\bar{x}$) | Standard deviation ($\sigma$) |
|---|---|---|
| Performance expectancy (PE) | 4.74 | 1.421 |
| Effort expectancy (EE) | 5.21 | 1.113 |
| Social influence (SI) | 3.84 | 1.274 |
| Facilitating conditions (FC) | 4.58 | 1.254 |
| Hedonic motivation (HM) | 4.28 | 1.468 |
| Perceived risks (PR) | 5.63 | 1.255 |
| Perceived personal image (PI) | 3.53 | 1.255 |
| Attitude | 3.69 | 1.512 |
| Behavior intention (BI) | 3.35 | 1.571 |
| Use behavior (UB) | 3.14 | 1.547 |

Notes: Scale: 1 = strongly disagree (SD); 2 = moderately disagree (MD); 3 = disagree (D); 4 = neutral (N) 5 = agree (A); 6 = moderately agree (MA); 7 = strongly agree (SA)

## Conclusion

The main objective of this study was to investigate the factors that influence government employees' use of personal social media accounts for work-related purposes. This was done by empirically testing the influence of **UTAUT** relationships on Tanzania government employees. Four constructs, namely, Hedonic Motivation, Perceived Personal Image, Perceived Risks, and Attitude (AT) were added to the UTAUT model in order to investigate their influence on the performance of the model. As shown in Table 10, the respondents have negative perception toward use of social media for work-related purposes. Furthermore, the structural model analysis showed that the respondents' perception is influenced by the following factors: Social Influence, Facilitating Conditions, Hedonic Motivation, Perceived Risks, Perceived Personal Image, Attitude, and Behavior Intention.

The results showed that the following factors are important for acceptance and use of personal social media accounts for work-related purposes among government employees.

In particular, the study showed that attitude has significantly high positive effect on both intention and actual use of personal social media for work-related purposes. On the other hand, the results showed that attitude of participants is positively determined by hedonic motivation and perceived personal image while perceived risks showed negative effect on attitude. These factors explained up to 57% of its variance. Furthermore, the study showed that attitude provided a bridge/mediation between other endogenous constructs with both the intention and actual use Behavior.

Furthermore, the results showed that performance expectancy has indirect positive effect on

Behavior Intention fully mediated by Perceived Personal Image. The other factors that showed significant effect on Behavior Intention include Perceived Personal Image and Attitude. Also, hedonic motivation showed indirect positive effect on Behavior Intention fully mediated by Perceived Personal Image and Attitude. These factors contributed to 73% of explained variance on Behavior Intention.

Finally, the results showed that, Perceived Risks have negative effect on actual use Behavior while Facilitating Conditions, Attitude, and Behavior Intention showed positive influence contributing up to 72% of its explained variance.

## Synonyms

Facebook; Information and communications technology (ICT); Nonprofit organization (NPO); Organizational goals; Social media strategies; Social networking; Twitter

## Definitions

Social media is a group of Internet-based applications that allow individuals to create, share, and exchange information and knowledge. Organizational capacity is the ability of an organization to accomplish its missions through leadership, management, financial, and operational support.

## Introduction

Nonprofit organizations (NPOs) fulfill important economic, social, and political functions. Economically, they provide services that are not economical in either the for-profit market or the government services industry. Socially, they bring people together to collaborate and achieve the common good. Politically, they mobilize constituents to advocate and influence policy makers.

The effectiveness of NPOs in fulfilling these important functions depends on their organizational capacity in terms of leadership, management, planning, operation, and other factors. Organizational capacity allows NPOs to achieve their goals and objectives. For example, human resource capacity is considered the most critical factor for achieving organizational goals. In addition, the capacity to engage individuals and strengthen networks affects NPOs' success in pursuing their objectives.

In recent years, NPOs began to adopt and use social media to increase their effectiveness in achieving their organizational goals. Social media technologies (e.g., Facebook, Twitter, YouTube, Instagram, and LinkedIn) are important tools for building and sustaining relationships among people and groups. Compared to traditional websites used for one-way sharing of web content, social media allow users to create, update, and exchange web content in an interactive way. Social media also facilitate the development of online social networks by allowing users to easily and instantly communicate with one another.

Given social media's cost-effectiveness and interactivity features, NPOs started using social media to spread information, develop two-way dialogue with their constituents, and encourage them to take action – for example, donating money, attending events, or advocating for a cause. As a result, these NPOs saw improvements in terms of faster service delivery, more media coverage, and increased stakeholder feedback. Large NPOs with larger social networks have received more donations via their social media platforms. Small and medium NPOs have also engaged their stakeholders in two-way dialogue and fostered better connections with them.

## Organizational Capacity

Organizational capacity is a multidimensional construct. In a broad sense, it refers to an organization's effective delivery of its mission. Specifically, it refers to a number of elements or attributes that, when mobilized, enable organizations to implement their programs, achieve their goals, and fulfill their missions.

Several capacity attributes have been identified in the literature. These attributes include, but are not limited to, management practices and organizational processes, general operating support (e.g., financial and human resources), technical

assistance, and external institutional networks. In addition, Fredericksen and London (2000) proposed the following capacity elements: leadership and vision, management and planning, fiscal planning and practice, and operational support. Specifically, leadership involves having a "cohesive board of directors" supported by community participation who are able to articulate the vision and mission of the organization (p. 234). Management and planning include the strategic planning process as well as the assessment and management of existing and potential human and fiscal resources. Further, fiscal planning and practice involves having a formal fiscal system, including financial tracking, reporting, and fundraising mechanisms. Finally, operational supports refer to staffing (such as the level of staff participation in decision-making), organizational structure, and facilities.

## Social Media Strategies

Literature suggests that social media strategies do not necessarily emerge from a clear strategic decision to support the organizational mission, but rather from initial experimentation with new technology and the subsequent need to set standards for it (Mergel and Bretschneider 2013). The application of social media platforms like Facebook and Twitter was originally aimed at social networking purposes. Organizational members who had some social networking experience with these technologies then began to experiment with them for work-related purposes – for example, by sharing information with their customers. This experimentation resulted in some positive and negative activities, which then made it apparent to organizational leaders that they needed to set standards and policies for social media. Ultimately, this is what led organizations to start developing social media strategies.

Social media strategies include choices regarding the use of social media applications and their integration in organizational tasks, objectives, and arrangements. These decisions depend on the strategies to mission fulfillment as well as the capacities, governance characteristics, and external pressures of the organization. The strategies intend to address such issues as what platform will be used, what type of information will be provided through this platform, who will provide the information, and what to do with the feedback received.

A formal social media plan can be developed through a number of mechanisms including "intraorganizational task forces, steering committees, policy boards, and technical rule-setting processes" (Mergel and Bretschneider 2013, p. 392). In NPOs, the process often involves consultations with several stakeholders including board members, managers, employees, customers, and others. During the development process, NPOs may also choose to hire marketing or public relations (PR) firms. Social media plans can set standards in a number of areas, such as the social media platform(s) that will be used; the type, frequency, and function of social media messages; the staff and funding dedicated to support social media initiatives; and evaluation measures and procedures, among others.

## Organizational Capacity as an Outcome of Social Media Strategies

Despite the importance of organizational capacity and social media in their own regards, empirical research has not fully examined the relationship between them, especially in the nonprofit context. Several studies have discussed the outcomes of information and communications technology (ICT) utilization by nonprofit, private, and government organizations. The focuses of these studies are not necessarily on social media (as ICTs include other technologies besides social media) or explicitly on nonprofit organizational capacity. Nonetheless, they shed light on the relationship between social media utilization and nonprofit organizational capacity.

Research suggests that NPOs that strategically use information technology to build their communication and social network capacities can ultimately increase their internal organizational capacity to fulfill their mission-related goals. For example, the American Red Cross's use of social media (i.e., Facebook and Twitter) to communicate with their stakeholders resulted in two-way

dialogue with them, which allowed the organization to provide faster service, generate more media coverage, and receive feedback on how to improve the organization. In addition, Amnesty International Norway was able to use Facebook to engage its constituents on a wider level about human rights in Norway.

Studies in the private sector have found that social media technologies help improve leadership capacity in PR firms. For example, public relations leaders who frequently used blogs were able to obtain more prestige and expert power than their counterparts who did not use blogs. Similarly, consumers perceived chief executive officers who used Twitter as being more transformational than their colleagues who did not use Twitter. Furthermore, social media help public relations professionals listen to constituents, generate dialogue, and perform environmental scanning. In sum, the consensus is that the use of Facebook and Twitter helps public relations leaders exhibit expert power, gain decision-making power, display vision in social media use, and establish leadership among their peers.

In addition, ICTs, including social media, can help NPOs improve their fiscal capacity in terms of fundraising. Saxton and Wang (2013) found that large organizations with larger social networks in Facebook receive more donations via Facebook Causes. Others revealed that a small NPO providing aid to victims of a wildfire was able to provide financial aid to such victims as a result of its successful use of Facebook to sell tee shirts and donate all profits back to relief efforts. Also, a NPO specializing in the training of assistance dogs was able to raise over $60,000 in 10 days through a social media fundraising campaign.

Another benefit of ICTs is that they can help NPOs build their operational capacity. ICTs can bring organizational members into contact with others with whom they normally do not have interactions, thereby facilitating the development of new groups. Also, ICTs can help organizational members acquire and use new knowledge, which ultimately can improve organizational decision-making. In fact, the process of creating social media policies and procedures itself can be a professional development opportunity for staff, thus building organizational capacity in the dimension of operation.

The literature also suggests that different social media strategies have different impacts on organizational capacity. For example, Twitter can help NPOs better interact with their stakeholders, which in turn can increase their capacity to build an online community. Also, organizations that use social media more frequently can become more comfortable and competent at using these technologies, consequently using social media for strategic purposes. This argument is supported by the finding of Hu and Shi (2017) that NPOs spending more time in their social media platforms are more effective at information transmission via Facebook. Also, NPOs that upload videos to their social media platforms can increase their capacity. One study found that NPOs whose fundraisers share video posts in Facebook raise more funds through JustGiving. In addition, NPOs that use community-building messages in social media can reach a larger audience and increase fundraising and engagement outcomes. For example, constituents are more likely to comment on Facebook messages when NPOs use two-way symmetrical messages intended to interact with them. Similarly, stakeholders are more likely to comment or like on Facebook when NPOs use community-building messages.

Moreover, NPOs that take a strategic approach to social media use can increase their internal organizational capacity. As evidenced in Sun et al. (2015) case study, a NPO's capacity was increased when its leaders were involved in developing and implementing a social media plan for the organization. The NPO also sought the advice from a PR firm, which helped the organization to systematically develop and schedule social media posts for its programs, as well as to track the frequency with which its posts were viewed. Ultimately, Sun and colleagues found that the implementation of a social media plan improved the NPO's internal organizational capacity, as not only at the organizational level the NPO raised more funds during its signature fundraising events but also at the individual level its staff began to collaborate more with each other.

## Barriers to Social Media Utilization

There are several barriers to social media utilization in NPOs. First, many NPOs lack resources for social media initiatives. Zheng (2013) found that lack of funding and designated full-time staff creates barriers for social media use in Chinese government agencies. A 2012 study conducted by the Nonprofit Technology Network (NTEN), Common Knowledge, and Blackbaud revealed that lack of staff or budget are major barriers to social media use among US NPOs. Second, lack of social media skills among staff and lack of leadership can impede the effectiveness of social media. For example, Zheng (2013) found that Chinese government organizations lack experience, skills, and training on social media use and leadership does not pay enough attention or provide sufficient support for social media use. Campbell et al. (2014) also found that many US public and nonprofit organizations did not use or were reluctant to use social media because they had a limited vision for social media. Third, constituency issues pose challenges to social media use in NPOs. Researchers have found that concerns about client confidentiality and the appropriateness of social media given an organization's target population are barriers to social media use in government and nonprofit organizations (Campbell et al. 2014; Zheng 2013).

## A Survey of Human Service NPOs

An electronic survey was conducted on a sample of human service NPOs in the Los Angeles metropolitan area in 2016. Among the 77 respondents, 18.3% of the NPOs reported that the use of social media is effective in helping their organizational capacity; 68.8% of the NPOs responded that they use Twitter in addition to Facebook; on average, NPOs tend to post on their social media sites almost weekly; 77.9% of the NPOs use social media posts for community building; 67.5% of the NPOs use videos in their social media posts; 55.8% of the NPOs have dedicated staff for social media postings; 20.8% of the NPOs hire a consulting or PR firm; 18.2% of the NPOs have dedicated funding for social media use; 40.3% of the NPOs have developed and implemented a social media plan or policy; 29.9% of the NPOs have executive director involvement in the development of the social media plan; and 48.1% of the NPOs use number of "comments" per post or tweet to measure the outcome of their social media use.

The sample also indicates that 35.1% of the NPOs started using social media as a response to their constituents or customers' demand; on average, NPOs have been using Facebook for about 1–6 years; a typical NPO has about 11 or 12 board members, 80.4 FT employees, and total assets of $13.3 million.

The sample consists of NPOs with different revenue sizes. For classification purposes, NPOs with annual revenue of $499,999 or below are defined as small NPOs, between $500,000 and $5 million as medium NPOs and $5 million or above as large NPOs. The sample consists of 28 small NPOs, 35 medium NPOs, and 14 large NPOs. None of the large NPOs reported that social media are effective in helping them improving organizational capacity, compared to 33.3% of the small NPOs and 14.7% of the medium NPOs. This suggests that social media may play a more important role for smaller organizations than for larger ones. However, despite the importance of social media, the percentage of small NPOs using Twitter is less than that of medium or large NPOs, 57% versus 74.3% or 78.6%, respectively. Also, compared to large NPOs, a smaller portion of small and medium NPOs have dedicated staff for social media or use PR firms. This is not surprising considering that large NPOs have at least ten times more FT employees than small and medium NPOs, as well as a much larger size of annual revenue and total assets that could be allocated for hiring a PR firm. Interestingly, compared to medium or large organizations, a larger percentage of small NPOs dedicate a certain amount of funding for social media use (though it may not be much) and involve executive directors in the development of their social media plans. This suggests that the emphasis on financial resources and leadership in small NPOs may be used as a way to supplement their

shortages in staff and technical expertise in social media use.

## Logit Regression Results

Based on a logit regression analysis of the survey data, the results indicate that NPOs that post more frequently on their social media sites are more likely to perceive social media as being successful in increasing their organizational capacity, holding all other things constant. Also, NPOs that have dedicated funding for social media use are more likely to perceive social media as being successful in increasing their organizational capacity, other things being equal.

On the other hand, NPOs that use Twitter in addition to Facebook are less likely to perceive social media as being effective in increasing their organizational capacity, holding all other things constant. Also, NPOs using social media posts for community-building purposes are less likely to perceive social media as being effective in increasing organizational capacity, holding other things constant. In addition, NPOs using video posts are less likely to perceive social media as being effective in increasing organizational capacity, all else being equal.

NPOs using social media as a response to customer demand are less likely to perceive social media as being effective in increasing organization capacity; the total assets of NPOs are negatively associated with social media's perceived effectiveness in terms of organizational capacity. One plausible explanation is that NPOs that adopted social media because of their customers demanded it may have higher expectations on the participation level of their customers on the organizations' social media sites and thus are more likely to be disappointed if the participation is lacking. For the same token, NPOs with larger assets may have higher expectations on the effect of social media. For example, $20,000 raised in a social media campaign may be perceived as a success by a small NPO but not by a large NPO. That is, the perceived effectiveness depends on different expectations and benchmarks used by individual organizations.

The longer the NPOs have been using Facebook, the more likely they are to perceive social media as being effective in improving their organizational capacity; the larger the board size of the NPOs, the more likely the NPOs perceive social media as being effective in improving organizational capacity, holding all others constant. However, the number of FT employees does not seem to have any effect.

## Content Analysis Results

The survey also contains an open-ended question asking: "What are the challenges facing your organization social media use? Please explain." Based on the categories that appeared frequently in the text data, the results of content analysis reveal four barriers to NPOs' social media use. First, lack of resources provides challenges to social media use in NPOs. Specifically, respondents indicated that their organizations lack funding for social media use, including funding to hire full-time staff dedicated to social media. This is consistent with Zheng's (2013) findings on the barrier to social media use in Chinese government agencies. As one respondent put it, "[b]udget is not allocated for social media use [b]ecause of limited funding." Another respondent indicated that his/her organization had "insufficient resources to hire staff to focus on social media only." Also, NPOs lack dedicated full-time staff to work on social media. This is also consistent with Zheng's findings. As one respondent wrote, "We don't have one person dedicated to social media. Instead we have a couple of people who give some of their time to [s]ocial [m]edia [e]fforts." In addition, given the lack of full-time staff, NPOs rely on volunteers to oversee social media efforts. One respondent stated that "[w]e have only one paid employee and rely on volunteers to generate content." Moreover, respondents reported that NPOs lack technology to support social media use.

Second, lack of social media competencies is another barrier to social media use in NPOs. For example, respondents indicated that staff in their organizations lacked knowledge on social media.

According to a respondent, a challenge facing his/her organization had to do with "[l]ack of knowledge by staff in what is appropriate for social media." Referring to staff in his/her organization, another respondent wrote, "[n]o one know[s] how to [use social media]." Also, respondents indicated that staff in their organizations lacked training on social media. This is consistent with Zheng's (2013) findings. A respondent stated that staff in his/her organization were "[n]ot trained in all aspects of social media." Another reported that a barrier to social media use in his/her organization had to do with "[t]raining staff who are not social media savvy."

Third, leaders' lack of strategy for social media hinders social media use in NPOs. Specifically, nonprofit leaders do not support social media and lack understanding on the value and benefits that can be derived from their use. A respondent indicated that his/her organization was "still developing leadership buy-in." Another wrote, "[e]xecutives don't understand the value of social media and how employees can be ambassadors for the agency mission and its good work." Also, nonprofit leaders do not get involved in social media use. A respondent indicated that a challenge facing his/her organization had to do with "[g]reater use of social media by organization leadership and board." Another wrote, "[b]oard do not use [social media]." Moreover, nonprofit leaders do not plan or dedicate time for social media use. A respondent stated that a challenge facing his/her organization pertained to "[f]inding the hours to put into an actual plan and executing." Another indicated that "[n]o time [was] allocated to this effort [that is, social media use]" in his/her organization.

Finally, constituency issues add another barrier to social media use in NPOs. For example, respondents indicated that their organizations' constituents either do not participate or are less active in social media. As one respondent put it, "[m]any of our members do not participate in social media." Another wrote, "[o]ur donor base is older and less active on social media." Also, respondents indicated that their organizations were concerned about protecting their constituents' privacy. This is consistent with previous findings on privacy as a barrier to social media use in public and nonprofit organizations (Campbell et al. 2014; Zheng 2013). As one respondent put it, "[w]e cannot disclose any of our clients['] information, which makes sharing photographs/info of client events, workshops, or updates difficult." These constituency concerns may be more of an issue for human service NPOs as they often deal with sensitive information and serve underprivileged populations.

In fact, the four barriers to social media use in nonprofit organizations – resources, expertise, leadership, and constituency – are components of organizational capacity. The result of the content analysis suggests that organizational capacity may also affect the use of social media in nonprofits.

## Conclusion

NPOs that post frequently on their social media sites and use dedicated funding for social media are more likely to perceive social media as being effective in increasing their organizational capacity. The results also show that, contrary to previous findings, NPOs that use Twitter, videos, and community-building-oriented posts are less likely to perceive social media as being effective. In addition, a qualitative content analysis of the open-ended survey questions suggests that NPOs face four major challenges in effective social media use. These challenges include lack of financial and human resources, lack of knowledge and skills in social media use, lack of leadership and strategies, and constituents' lack of active participation.

Some of the results from this study are consistent with the theoretical arguments or prior empirical evidence on social media or ICT in general, such as the importance of frequent posting and dedicated funding, as well as the barriers to social media use in NPOs. However, other results are opposite to what the literature has suggested, such as the effects of Twitter, video posts, and community-building messages. The difference in findings may be due to differences in samples, analytical techniques, and outcome measurements.

Furthermore, the study offers important managerial implications for nonprofit practitioners. First, NPO board members and executive

directors should consider embracing new social media technologies and setting social media use as one of the priorities for their organizations. They should craft the visions for the organization on how to use social media to advance their organizational goals. Senior leaders should get themselves familiar with social media so that they can inspire the staff to work on the platforms more efficiently.

Second, NPOs that lack resources and social media expertise should take advantage of rich online resources on social media training and learn best practices. Jumping on the bandwagon of social media such as Twitter and video posts without fully understanding and knowing how to use them may have a reverse effect on the organizational goals. For example, how to write a clear, concise Twitter post within 140 (now 280) characters requires tactics and practice. A vague or confusing Twitter post will not be effective in achieving the intended purpose. Likewise, a low-quality or misleading video post may negatively affect a NPO's image.

Last, but not the least, NPOs should find innovative ways to engage their constituents and send them consistent messages. Client or customer surveys would be helpful to find out what topics their target audience are interested in, what communication channels or methods they prefer, what concerns they may have, etc. For those clients who are concerned about privacy, NPOs should inform them of the organization's privacy policy and obtain their consent before publishing any client-related information on the social media sites.

Social media in public administration

## Definition

New forms of Internet-based communication such as social media play a fundamental role in shaping local democracy.

## Introduction

Public administration has changed in the last 20 years. The Internet has played an important role in this transformation, leading to an increasing use of online media, such as websites, social networking sites, and the blogs by the government for various public communications aims.

Also the citizens' demands toward public administrations has radically changed in the last few years. Indeed, ministries, regions, municipalities, and public entities in general have to interact with increasingly demanding and aware citizens that are not satisfied with acceptable services in average times but demand clear, specific, rapid, and tailor-made responses.

Public entities, in any case, should be able to provide "traceable" responses that are clear and related to specific standards of quality.

To pay a tax, enrol the children to day care, run a business, and search for travel information are all activities that can be done on a website or questioning a social media platform like Facebook and Twitter. Citizens who log in to a web portal can access the website's services and get, through the portal itself, specific and immediate responses.

## Accountability, e-Government, and Social Media

In terms of accountability and transparency, information and communication technologies (ICTs) are changing the relationship between public administrations and citizens (Gesuele 2016). In fact, citizens increasingly use new technologies that can facilitate a proactive role in dialogue with the government. The so-called e-government approach is increasingly central to increasing transparency, citizens' engagement, and promoting anti-corruption initiatives (Bertot et al. 2012). With a demand for constantly evolving services and fewer resources available, the governments have had to look for innovative new ways to produce public value.

Many expectations in this sense are placed on the growth of social media, ubiquitous mobile connectivity, and Web 2.0 interactivity, which for the first time provide cheap communication not just for a one-way communication but also for a more constant involvement of citizens (Strahilevitz and Benkler 2007). On the other hand, other forms of communication, such as the sustainability report, after a growth phase are suffering a crisis both in terms of diffusion and in terms of use and perceived utility (Giacomini 2016; Giacomini et al. 2018).

Social media and Web 2.0 simultaneously group activities that combine content production and social interaction. Social media tools combine the different voices of the web people to collaboratively connect online information. Thanks to social media, every user can, alone or immediately in collaboration with others, create, organize, edit, and share content. Web 2.0 refers to formats that allow for interactive cooperation and information sharing and represents a decisive evolution of the Web 1.0 tools that were focused on a one-way approach to websites and which were the standard of online websites in the 1990s (Nabatchi and Mergel 2010). However, the reach and significance of social media remain difficult to define clearly, above all because of the fact that because it continues to increase in the number and types of tools presented.

As stated by O'Reilly (2005), Web 2.0 refers to a second generation of Web technologies that allow and promote collaboration and interaction, unlike the more static and unidirectional Web 1.0. Web 2.0 is characterized by the possibility of offering dynamic content, user participation, and rich user experience. The Web 2.0 approach tends to change the communication model based on an asymmetry between transmitter and receiver: with the network, in fact, the society becomes more horizontal. This feature also affects how content is produced, since everyone can tend to be authors, thus increasing the amount of knowledge potentially available on the web and, probably, its quality. These new methods widen the horizons of public communication, in particular of relations between public sector institutions and citizens.

In the last years, some municipalities have started adding social media to communication through their official websites (e-disclosure). Growing dynamics of social media show that they are not an out-of-the-ordinary phenomenon but that, on the contrary, they will be increasingly relevant in the citizen-government relationship.

In particular, they use Facebook, Twitter, and YouTube as the most popular social media (Gesuele 2016). The growing use of social media

facilitates direct interaction with citizens. In light of this situation and this growing phenomenon, several scholars have studied the reasons that local governments bring to communicate through social media in order to increase their level of accountability.

It must be emphasized how the use of Internet and social media allows knowing a huge amount of information at low costs (Bonsón et al. 2015).

The government-citizen relationship is increasingly seen in the perspective of "citizen coproduction," thanks to new technologies and the Web 2.0 that has made the coproduction "more relevant and viable" with advances in technology (Johnston and Hansen 2011). In this light, the government treats the public not as customers but as coproducers, enhancing the image of citizens from one of "mere passive" consumers of public services to co-producers (Mattson 1986).

Public administrations are facing a situation of constant technological innovation and uncertainty in the new media assessment; therefore they are examining the opportunity to use these new tools to communicate with citizens.

On the one hand, within public administrations, there are those who see new technologies as an opportunity to communicate with target users not reached by traditional media and as a useful tool to inform and involve citizen. On the other hand, there are those who consider social media as a waste of time and resources. In particular, they consider that social media will lead nothing new to the relationship and to the communication strategies between public administration and citizens.

However, social media have already come into public administration, especially for those who believed in a multichannel service delivery approach. For instance, some public entities have made their own Facebook page.

Public administrations use Facebook both for providing information and promoting events and initiatives, for creating new spaces for debate with citizens and new channels to collect their views, and finally for measuring users' satisfaction toward public services and activities.

Social media, in their innovative development, can potentially be valuable e-democracy and e-government tools, virtual arenas for participation and expression of needs, opinions, and interests.

Therefore, the use of social media platforms by public administrations responds to various needs and purposes, in particular: to raise the profile of the entity, to promote initiatives and events, to increase public administrations' authority, to inform on the services offered and how to use them, etc.

As for communication in general, for an effective use of social media, the design phase is essential. It is fundamental to identify: the recipients, the aims and the resources available.

These new communication tools disseminated by the Web 2.0 require a constant content updates and the ability to keep up with future social media platforms developments. Therefore, public administrations that use these tools should not underestimate the need for continuous updates and resources to guarantee them and should also consider the use of tools for analyzing the results achieved such as sentiment analysis.

## Conclusions

To keep the public administrations and government accountable for their actions, citizens must know what these actions are. To this end, the expansion of social media and new information and communication technologies brings with it great opportunities for public administrations at all levels of government. In particular, these new tools, if used within a well-defined strategy, can be disruptive in promoting a transparent and accountable relationship between public administrations and citizens.

Social media and Web 2.0 in general allow a two-way information flow between public administrations and citizens. Indeed, through social media, not only the public administration but also every citizen can create or share contents. In this relationship the citizen is not only seen as a customer but as contents' coproducer. In this new role, citizens can bring new

unconventional and innovative solutions to face and solve community's problems. So, this coproduction process can also increase citizens' engagement toward public administration. Therefore, thanks to social media, the government-citizen relation is more direct, and the asymmetry between transmitter and receiver is reduced.

Today, the number of public entities that have an account on one of the most popular social media is constantly growing. In fact, in addition to the benefits listed above, social media also allow public administrations to produce and distribute information at low costs and, from a citizen perspective, to obtain rapid and specific responses.

Technological tool developments are really fast, and public administrations must be prepared to attract the right skills and resources in order to keep up with future social media developments.

## Synonyms

Online community communication channels; Online social forum; Social networking sites

## Definition

Social media refers to various forms of electronic communications through which end users share different forms of ideas and content, which includes pictures, video clips, and messages. Social media applications are also venues for microblogging and networking among invited individuals with mostly similar interests.

## Introduction

Contemporary public managers should be adequately conversant with the new-networked workplace and be familiar with social media technologies (Mergel 2012). These applications are transforming organizational cultures in unprecedented ways. Governments and other institutions

are finding social media as important tools for communicative exchanges with the public.

Perhaps one organizational motivation is to use social media to broadcast and share news and information among stakeholders as a means to enhance accountability and transparency. Because of the media's capability to broadcast messages on a 24/7/365 basis, it is easy to reach all populations or constituencies. Public organizations realize that social media channels are great for targeting selected audiences. For instance, 74% of online adults use social networking sites. About 71% of all online users in the USA are active on Facebook, which also owns Instagram, a mobile app with over 200 million users. In terms of demographics, there is no group left out. Data shows the fastest growing demographic on Twitter is the 55–64 year age bracket (Patterson 2015).

Besides scope of outreach, social media is a cheap tool and can be relied upon even during periods of budgetary cutbacks and in emergency situations. According to Everbridge (2015), a global provider of critical communication solutions, 47% of government organizations use social media for crisis communications. This is even higher than the rate of 31.2% obtained in the corporate world (Everbridge 2015). Smarsh, a leading Portland, Oregon-based provider of archiving technologies disclosed that 74% of online adults use social media networking sites (Smarsh 2015). Therefore, Social media is a key part of organizational communication strategy.

While the larger goal is communication and service differentiation and marketing, each organization has its own strategy, formal or informal, that outlines the rules of engagement in social media. Some even go further to announce policies concerning content retention and applications of e-discovery provisions and the Freedom of Information Act requests.

Still, considering the fast pace of technological innovation, our understanding of what social media is is evolving. For instance, a list of the most commonly used social media platforms has generally included the following: Facebook, Twitter, Instagram, Google+, Friendster, LinkedIn, Classmates.com, Pinterest, Skype, Tumblr, Piczo, and MySpace. In developing countries, the emergence of Facebook-owned WhatsApp, Snapchat, and Youtube may be added to the list. Many of these platforms have derivatives, for instance, Twilert is a Google Alerts version of Twitter. Newsle helps track when an agency is cited in newsletters and newspapers. Although LinkedIn has established itself as a professional network, it has not freed itself from socializing and through its signal device allows members to search updates of those within the cohort. Furthermore, social media platforms are now solidly integrated with other applications on mobile devices. Considering that Millennials constitute over 34% of the US and global workforce in general, social media tools will be key communication asset for the twenty-first century workforce and beyond.

Although social media applications affect nearly every aspect of our culture and workplace, scholarly research on the role and functions of social media in public employment constitutes new academic territory. Concern over the short- and long-term impact of social media on human resource practice has, however, received considerable attention in scholarly and professional publications (for example, Tubbs-Jones 2016). The rest of this discussion explores the various applications of social media paying particular attention to functionalities within the core areas of human resource management. We examine functionality in tasks such as position and workforce, recruitment and selection, performance management, and cross cutting issues, which are not mutually exclusive to broad organizational communication strategies. Cross-cutting issues include employee and employer rights and attendant legal frameworks. Experts in human resource management refer to the broad range of social media applications as Social HR.

## Position Planning and Creation of New Policies

Strategic planning deals with issues that affect the organization's present and future, especially the critical missions and tasks to be achieved. Strategic planning affects how human resource (HR) personnel in organizations do their jobs.

Savvy HR managers want to minimize costs and maximize benefits to departments. Strategic analysis is key to determination of organizational strengths, weaknesses, opportunities, and threats (SWOT). Social media is particularly suitable for obtaining feedback about quality of organizational services. To be successful at planning, public organizations are increasingly using social media for self-assessment and determination of external factors that might affect the attainment of strategic goals. As communication tools, these platforms are uniquely suitable in enabling discussions around shaping organizational cultures and goal articulation. Social media makes it much easier for the public to inform policy makers what is most important to them as citizens.

Ackerman and Krupp Melissa (2016) offered ideas on how social media can be used to maximize organizational goals. They offer a SOCIAL approach that captures and represents best practices in use of social media within public organizations. SOCIAL stands for Share Ongoing Change through International Awareness and Learning. Today, social media apps are public relation tools, which explain aspects of organizational culture and enhance service differentiation. For example, police posting on social images acts of kindness by service men and women help foster culture of empathy rather than hostility.

Studies also show employers now use social media in articulating and updating policy changes and aspects of strategic communication and dissemination. The former involves creation of communication plans, public policy marketing messaging, and citizen engagement in public events.

## Recruitment and Selection

Since presence on social media provides a window for public organizations to showcase their craft, the role in recruitment is amplified when HR managers make good use of existing platforms. These platforms are often integrated with Web 2.0 technologies which encompass blogs, wikis, texting, Google docs, Google Reader, Ryze, and other applications that provide online profiles of users.

Furthermore, public organizations now post vacancies and accept resumes on job boards and fairs hosted in these medias. Recruiters screen job applicants in order to select the best person for the job relying on these media. Social media is rich on personal data and information about a candidate's knowledge, skills, and competencies. HR personnel are increasingly relying on social media resources to profile and tap talent. At the same time, job candidates can track application statuses through the same channels.

Similar to approaches in offline recruitment and selection, there are legal issues to be addressed. For example, as a matter of personnel policy, social media reveals identifiable data about job candidates.

The US Equal Employment Opportunity Commission (EEOC) brought this concern to the attention of HR professionals. When HR specialists browse through social media websites, for recruitment and selection purposes, they easily pick identifiable information about potential recruits. Improper use of such information may jeopardize recruitment efforts and is potentially an issue which introduces discrimination in the acquisition function. In addition, improper use of information from websites may be a factor in discriminatory cases. The race, gender, age, sexual orientation, and ethnicity of candidates is discernable from social media websites and employers who use it for recruitment purposes have to be aware of potential biases.

While no federal law regulates social media for recruitment and selection purposes, state legislatures have moved ahead to embed restrictions within the privacy discourses. For example, Illinois Right to Privacy in the Workplace Act effective since 2013 is one example. Among the notable state laws include provisions to prohibit employers from retaliation against employees who refuse to comply with requests made on social media. Similar legal sanctions are applicable to other personnel actions, such as hiring and promotions.

State social media laws also restrict uses of social media for applicant screening and background checking. California, Illinois, Maryland, and Michigan have laws that protect job

applicants concerning their social media activities. Needless to say, background checks in general are a part of the recruitment process but reliance on anecdotes derived from social media websites is generally contestable under emerging state legal frameworks.

Since 2014, over 20 states legislated against employers' access to personal social media information and restricted employers from asking employees to "friend" supervisors on social media networks (Crespo and Lyon 2015). Several states, which include Arkansas, California, Colorado, Connecticut, Michigan, Oklahoma, Oregon, Rhode Island, Tennessee, and Washington prohibit or restrict employers from seeking passwords or access into employee personal social media accounts.

Cities also recognize the importance of social media in communications, especially for mobilization and outreach purposes. Some cities start Facebook groups' pages for encouraging openness in communication and building a community. As such, several towns such as New Windsor, Hampstead, and Manchester in Maryland have adopted regulatory policies that restrict employees from posting profanity, sexually devious materials, personal and discriminatory attacks. Many of these policies are about protecting organizational images and restricting inappropriate uses of social media. Some of the notable policies include prohibition of employees from comments that promote particular services, political perspectives, and products. Although city and county social media policies are becoming common, there are those who consider such policies as unnecessary and a way toward a nanny state. The major concern is that employees have rights over use of their own personal social media accounts.

## Performance Management

Performance management deals with identification, measurement, development, and management of performance in organizations. In public settings, especially where unions are involved, performance management is structured by collective bargaining contracts. In general, social networks are an excellent avenue for public organizational leaders to appreciate employees' efforts and acknowledge both individual and unit contributions to departmental success. Because information on social media is public, announcing employee accomplishments on such platforms can be a morale booster, if done appropriately.

Social media is used for purposes of generating teamwork and collegiality, which are necessary for fostering a friendly work culture and raising productivity. Most public organizations have established Facebook accounts for their departments allowing members to build community and also have a sense of empowerment.

Empowerment is evident mostly when social media platforms allow for employees to document organizational problems, announce work anniversaries, birthdays, important career milestones, and, in some cases, vent out frustrations through whistle blowing. Although employers may encourage employee empowerment, managers increasingly monitor employee communication to discern employee sense of professionalism.

One of the reasons for organizational interest in social media is that it allows managers to understand employees' communication skills and sense of professionalism. Monitoring social media communications can also be seen as a way of tracking any aspects of employee wrongdoing. The argument is that not paying attention to social media may be costly. Disgruntled employees can use it for harassment and bring tensions to the workplace. As such, the different policy frameworks governing social media applications and how ideas are shared are important in public employment law and practice. Therefore, performance management goes beyond understanding how well employees perform productively and the legalities thereof. It behooves HR personnel to move to the next step of designing improvement interventions through training and development.

## Development and Training

Can social media be used to develop employee skills and competencies? Clearly, the increased use of file sharing on social media supplements

popular options for knowledge transfer and talent management. The extent to which workplace knowledge is transferred and learned has not been thoroughly investigated but it exists. And because public organizations now offer training and development to employees anytime from anywhere, many applications are embedded within regular E-Learning modules. In addition, YouTube clips with online lectures from experts are commonly used in training sessions and have been appreciated by government leaders. For example, the US Government Accountability Office (2003) reported online learning as an important cost-beneficial avenue for employee training. In addition, many users of social media deliver excellent resources that help educate both managers and their subordinates.

All applications have different merits and serve in different occupational settings. For instance, LinkedIn, regarded in Smarsh (2015) as popular among the more affluent employees, is a great conveyor of miniblogs and insightful articles on employee best practices. In other words, social media provides an extra avenue for employee conversations about best practices and benchmarking. Besides, networking by itself is a form of employee enrichment and reflective human resource practices. Through social media, professional peers also share strategies for career development and advancement. Many users of social media have reported benefits of mentoring especially when emerging professional are invited to join networks involving senior colleagues and to follow activities and posts of field leaders. Social media offers great opportunities for professional socialization and is now one of the most proactive avenues for preparation of the next generation of public employees.

## Crosscutting Issues

Generally speaking, the Internet is like a jungle where employees post work-related policies, criticize workmates, and often use unprofessional language and images, in the name of humor. As such, social media raises issues concerning the legitimate boundary between the public and private spheres. Off-duty communication between members of an organization can be potentially queried. Conducts of supervisor–subordinate relations within social media relations are beginning to be contested in the court system. For instance, *City School District of the City of New York* v. *McGraham* (2010), a teacher was found guilty of misconduct for off-duty comments. The 36-year-old tenured teacher and also advisor to a Poetry Club had posted personal matters to her student, then a minor, seeking clarification over their relationship. This was after the two had consistently communicated with each other on e-mail and social media. The teacher's contacts with student increased substantially to the point where she sent him movies she thought he would find interesting, which included a movie on relationships *Harold and Maude*, *Fahrenheit 9/11*, and *Catcher in the Rye*.

The case was compared to another, *City School District of City of New York v. Hershkowitz* (2005), in which a teacher had been found guilty of exchanging sexually explicit e-mail messages with her teenage student. The respondent's actions were ruled to be inappropriate and unbecoming of a teacher whose role was to educate and protect children and not engage in a sexual manner with those under her care. Cary Hershkowitz, a tenured teacher employed by the City School District of the City of New York, was also charged with inappropriate interactions with other students.

Posting of disparaging remarks on social media can also lead to an employee facing disciplinary action. A teacher was discharged for posting abusive remarks about a Head Start program administrator. In a case involving *Vista Nuevas Head Start*, (2011) the courts found that the employer's decision to discharge a teacher for her off-duty unprofessional comments on Facebook was justified.

In the same breadth, in *Re O'Brien* (2013) another teacher was discharged for a similar behavior. Many other examples are available that illustrate the dangers of posting in artful work-related comments and pictures on Facebook and other social media. Cyber harassment and bullying fall in the same category as posting material deemed inappropriate. Social media is not off

limits for those seeking to discipline an employee for harassment, including the context of creating a hostile workplace. For this reason, the US Equal Employment Opportunity Commission (EEOC) has received and allowed complaints of racial harassment over social media to move forward.

However, in *L'Anse Creuse Public Schools* (2008), a contrast was evident. The case involved another teacher who posted sexually explicit materials on social media; there was a reversal of the disciplinary action. An arbitrator ruled in support of the teacher contending that the school district did not have just cause to terminate her. That determination was because the activity occurred off-premises and the teacher did not authorize her photos to be posted.

Another high profile case which received wide publicity involved General David Petraeus, former Director of the Central Intelligence Agency (CIA). General Petraeus was accused of inappropriate electronic media communication with his biographer, Paula Broadwell. Their colleagues posted insinuating several Twitter messages about the two having extramarital affairs. Following the sex scandal, Petraeus resigned in late 2012.

While reviewing the increased number of termination cases brought to the National Labor Relations Board (NLRB), it is evident that different rulings are made based on the nature of the social media *content* and *employee responses*. Although the NLRB focuses primarily on private sector cases, it has increasingly established principles that illuminate on social media in employment generally. As early as 2010, the NLRB had already received complaints regarding employees using social media. Two reports were released in 2011 and 2012 to try and help guide unions and employers in designing policies and practices involving employee uses of social media. The NLRB reports determined, for example, that employee use of social media to complain about work is not "protected concerned activity." NLRB noted that employees who discussed terms and conditions of employment on social media engaged in "protected concerted activity." And, unions were discouraged from unlawful use of social media to coerce members. Cases at NLRB provide a hint as to emerging dos and don'ts of social media communication in public employment.

For instance, in a 2012 decision involving the firing of a car salesman at BMW who had posted pictures of Facebook, it was decided the post did not involve fellow employees. The NLRB reiterated that the decision for firing employees was supported if the individual engaged in protected concerted activities, which is a criterion that the BMW employee did not meet (NLRB 2014).

Additionally, through another NLRB case, it is now determined that a simple "like" click on Facebook falls under the protection of Federal labor law. An employee cannot be separated from her job for "liking" a post made on Facebook. This standard was established in 2014 after an NLRB panel agreed that Triple Play Sports Bar and Grille had violated the National Labor Relations Act after separating two employees, bartender Jillian Sanzone and cook Vincent Spinella were found to have "liked" remarks critical of their boss.

In general, therefore, social media like other electronic communication platforms are not completely free. The Electronic Communications Privacy Act of 1986 permits the FBI and other federal agents to access electronic transmissions without a warrant. There is simply no protection on public employees being fired for inappropriate messages and images posted on social media (Jacobson and Tufts 2013). Current federal policy does not prohibit employers from requesting passwords and user names from employees. The issue is complicated when organizations require employees to bring personal smartphones and laptops to work. There are, however, few state legislatures that have begun formal to enact protective legislation due to public discontentment with the status quo.

## Managing Diversity and the Free Speech

While organizations are embracing the use of social media for different functions and purposes, of great concern to HR professionals is

the constitutional imperative involved. Employers and employees have rights, which should be protected. At the same time, employers recognize employee's First Amendment rights which these to be weighed against the organizational needs "to create and maintain cooperative workplace free from the bullying and harassment that may result from one or more employee's social media posts" (Tubbs-Jones 2016). In tandem with First Amendment protections, public organizations are expected to be leaders in promoting values such as representativeness and appreciation for diversity. This means organizational policies are expected to safeguard those values. Case law is replete with examples showing that public organizations are yet to resolve issues of cultural insensitivity in the workplace. We considered a few illustrative cases emanating from police departments, which also happen to be among the most visible public sector employment occupation.

In 2012, seventeen police officials from New York Police Department (NYPD) were disciplined for posting racially inflammatory remarks on Facebook. Some officers had made offensive comments about the West Indian Day Parade being held in town. Some of the cops referred to the parade revelers as "savages" and "animals." Another remarked "kill them all" (Kemp 2012).

In 2013, there was another case where one Joe Cassano, a son of New York City Fire Department's commissioner, Sal Cassano, resigned after he posted racially inflammatory remarks on his Twitter handle. Joe was employed as an EMT with the department. These misdeeds led to a review of NYPD social media policies (Goodman and Ruderman 2013). As tools for internal vertical and horizontal communications, social media is making a mark.

Although venting against someone is protected speech under the First Amendment, social media turns into an item of crime under different circumstances. For instance, if an identifiable person uses social media in a threatening manner and presents an imminent danger, the speech becomes a threat. Let us briefly consider uses of social media in law enforcement practice.

## Instrumental Uses of Social Media in Public Law Enforcement Occupations

Social media is now the first place that law enforcement agents go to when seeking for clues about threats to public safety. For example, the Baltimore County Police department was able to investigate individuals who had threatened law enforcement officials on social media outlets in the wake of antipolice riots in 2014. Police departments monitor Twitter, Facebook, and Instagram threads to investigate threats made against force members.

Social media is changing the workplace in numerous ways. In law enforcement, tools for public safety have become more complex and agencies have moved away from old Wild West style "Wanted" posters to police radio, patrol cars, electronic billboards, and now handheld devices that access Twitter, Facebook, and YouTube broadcasts. And it does not stop there; jurors share opinions on social media, even after handling a difficult case. But criminals also use social media for recruitment of terrorists and for pedophiles, who stalk victims online. Thanks to geotagging and use of metadata images it is now possible to locate some missing persons. Police frequently use photos uploaded on social media to find child pornographers and their victims. Police in cities like Seattle have a Twitter feed called "Get Your Car Back" in which staff send license plate numbers and other information about stolen cars. More applications exist and space does not permit us to consider many more service applications out there.

In the same breadth, state and federal authorities have laws and regulations that permit law enforcement agencies to request access into social media websites for investigation purposes. For example, California's social media law does not limit employers from requesting employees to divulge passwords in the course of investigations. Similar laws exist in Colorado and Maryland, but in the latter, access to private social media accounts has to be provided when investigations are about potential misappropriation of proprietary information and violations of securities laws. In other words, state request for social media accounts is confined to specified investigations.

At the other end of the spectrum, police officials, some of whom are now required to wear body cameras, have to be aware that their workspace is part of the ever-expanding surveillance society. In *Glik* v. *Cunniffe* (2011), the 1st US Circuit Court of Appeals ruled that a private citizen might use mobile devices to videotape or film police officials in public space and send the images to their social media platforms. Such actions are protected under the First Amendment rights.

There are drawbacks to this nexus between surveillance society and social media. This is glaringly true in the context democratic expectations about public employment. Among the challenges is the debate over just how much privacy should public officials expect in the workplace? There are other emerging concerns, for instance, police agencies have to grapple with how to obtain records generated in social media platforms. Some of the messages and uploaded video clips that originate from foreign countries where the rule of law is weak require a lot of resources to authenticate. There are further complications stemming from the fact that social media websites are incorporated in different geographical locations, which makes it hard to serve search warrants, in cases where that step is required. Microsoft-owned Skype, for example, is incorporated in Luxembourg. This means that enforcement agencies require diplomatic channels to do their job well. And that just adds to the layer of bureaucracies to be navigated. Moreover, the amounts of information on the Internet can overwhelm any organization. Agencies that conduct some official work on social media have to grapple with issues of data management systems, which requires periodic training. The potential for criminals to organize using social media complicates matters and, especially, if hacking is involved. These and other challenges are real issues for contemporary public organizations.

## Conclusion

In conclusion, social media is an essential part of twenty-first century living and has attracted attention of scholars and human resource experts. While there are several applications of social media in HR practice, we have considered only a few applications in areas such as planning, recruitment and selection, and performance management. Yet, applications go beyond HR practices and delve into broader communication applications. And there is heightened relevance in some public sector employment, especially in law enforcement, which utilizes data mining techniques to profile persons under investigation.

In all cases, social media uses must be governed by law and that is why constitutional scholars are paying attention to these new medias. From a legal perspective, the scope of protections for individual or group social media use varies between different public sector settings. Case law on social media applications is evolving and will in future govern potential uses.

# Social Media Use by Government

Ola G. El-Taliawi
Lee Kuan Yew School of Public Policy, National University of Singapore, Singapore, Singapore

## Synonyms

Digital government; e-government; Open government; Smart government; Wiki-government

## Definition

Social media use by governments refers to the use of web-based tools, including Facebook and Twitter, to provide government information and services and to foster social engagement with stakeholders.

## Introduction

Over the past 15 years, social media use increased considerably across the globe. It is evolving from a mere trend to an almost daily lifestyle to "check your profile" or "update your blog." Social media has changed communication modes and access to information exponentially, and while businesses were the first to pick up on it, governments soon followed suit. Although the scope of the literature examining social media use is expansive, the scope of this entry is limited to its use in the public administration. It first starts with a definition of the term "social media," followed by a brief historical synopsis of its infiltration into the government domain. Following, this entry highlights the main modes of social media use by governments; as well as the benefits and challenges of social media adoption in the public service. Finally, it ends with a brief discussion of the main policy dilemmas agencies need to resolve to align social media use with agency goals and objectives.

## Social Media: The Term

While there is no one standard definition of "social media," according to scholars it refers to tools that facilitate web-based social interaction and collaboration (Bryer and Zavattaro 2011). Two main features distinguish social media from traditional media and other types of technologies: (1) content creation, which refers to the ability of end users, rather than professional sources, to create content themselves; and (2) the existence of multidimensional interaction channels between users (Bertot et al. 2012). Heavy reliance on multimedia, such as visual and sound information, as opposed to just text, is also a predominant feature of most social media tools (Landsbergen 2010). Social media in government, therefore, is an umbrella term that refers to the group of web-based technologies that allow public agencies to foster social engagement with citizens, businesses, and other public and nonprofit organizations (Criado et al. 2013).

## From e-Government to Government 2.0: The History

The use of social media by governments can be traced back to the emergence of "Web 1.0" technologies that revolutionized the way commerce was conducted and paved the way for a

new era of electronic commerce. E-commerce gave rise to two major developments: (1) the removal of geographic distances, by allowing firms to do business virtually; and (2) the increase of customer exposure and expectations, by allowing customers to compare services and products with the best benchmarks (Dadashzadeh 2010). Governments soon followed suit in adopting the use of "Web 1.0" tools, and e-government initiatives were implemented in many developed countries. The first US government website (USA.gov) went online in September 2000 (National Research Council 2007). The primary objective of using "Web 1.0" tools at the time was to facilitate the administration of government operations and to allow self-service delivery such as payment of bills and fines (Díaz-Díaz and Pérez-González 2016).

Following, further developments in ICT introduced "Web 2.0" technologies that transformed passive web surfers into active content creators, giving rise to "social media" as a powerful networking tool (Dadashzadeh 2010). While businesses again took the lead in using social media, it was soon adopted in the public domain. Several electoral campaigns made use of this powerful tool, including Barack Obama's 2008 presidential campaign, which regularly features as a prominent example in the use of social media in political communication and campaigning (Jaeger et al. 2010). Soon afterwards, government agencies in the United States and other countries started employing social media for government use, and the public became increasingly expectant of governments to become accessible on social media platforms (Bertot et al. 2012).

## Modes of Social Media Use by Governments

Social media applications and tools vary widely with regards to function, type of content, and other features. Many of them are used, often simultaneously, by governments to interact with citizens at both central and local levels. In 2014, 26 out of 34 OECD governments had an official presence on social media, primarily to disseminate information, engage stakeholders in governance processes, and improve service delivery (Mickoleit 2014).

Some of the applications used by government institutions include the microblogging platform Twitter, the social networking site Facebook, as well as RSS Feeds, multimedia sharing sites, mashup applications, and others. For example, the US Environmental Protection Agency operates accounts on YouTube, Facebook, Flickr, and Instagram at the same time. The US Government website lists a plethora of downloadable applications catering for travelers, families, children, and emergencies.

Some agencies have also moved from experimentation to standardization of social media use by putting in place policies to guide employees. For instance, the European Commission has a guidebook on the use of social media by staff in both their professional and personal capacities. Additionally, the US Government has a digital government strategy and open data policy in place to provide agencies with guidance on how to use and improve their digital services. This is just to name a few.

## Benefits and Challenges of Social Media Adoption in the Public Service

Beyond social media being just a trend, many scholars have provided rationale of the importance of government adoption of social media use. Firstly, it is said that social media use by governments can enhance social capital, where government agencies and officials become part of individuals' social networks and engage with them in an interactive manner. In this case, government is no longer a mere broadcaster of information, but a member of citizens' networks (Landsbergen 2010). Secondly, social media tools can be used by policymakers to gauge public opinion on policy proposals before their release (Mergel 2014), raising governments' socio-political legitimacy and ability to implement policies successfully. Thirdly, social media can be relied on to facilitate collaboration between citizens and governments in

co-producing services (Linders 2012). Finally, social media can act as a strategic communication tool during emergency, disaster, and crisis management. For example, in 2010 when volcanic eruptions in Iceland interrupted the travel plans of almost nine million people worldwide, the European Organisation for the Safety of Air Navigation (Eurocontrol) used social media channels to communicate with the affected population, which allowed people to organize themselves more effectively (Hiltz et al. 2011). In the same year, for the first time the US government used social media to coordinate its response with other agencies to the earthquake disaster in Haiti (Yates and Paquette 2011).

However, and despite the massive potential social media use can have for governments, their adoption and management are by no means an easy task to undertake. This realization has driven some scholars to go all the way as to question whether governments should embark on this path altogether. Some of the potential challenges include (1) a lack of strategy in implementation that would make social media use more ad hoc and difficult to sustain on the long run (Godwin et al. 2008); (2) an agency's poor quality of interaction that may not encourage citizens to take part, which might eventually harm the agency's image (Bryer and Zavattaro 2011); (3) the possibility of spreading rumors or challenging authority (Alexander 2014); (4) the difficulty of making sense of the massive amounts of data processed daily on the different social media platforms (Mergel 2014); and (5) the exclusion of non-Internet users, because of disability or financial disadvantage (Bertot et al. 2012).

## Social Media Policy Dilemmas

Evidently social media adoption and use by government agencies should not be ad hoc. For its use to be effective, agencies need to put in place a clear strategy that clarifies some of the following dilemmas posed by "going digital": how to ensure conversations and interactions are not "hijacked" or dominated by malicious users, without compromising on openness, transparency and free speech; and how to create a balance between centralized and local needs that might require different adaptations (Landsbergen 2010). Further, since different tools have different "architectures," the question of which tools and approaches best promote an agency's goals needs to be tackled (Bertot et al. 2012). Moreover, the budgetary, human resource and financial implications of social media use have to be carefully thought out (Bryer and Zavattaro 2011). For instance, the personal use of social media at work might pose an ethical time management problem, but it might also be hard to forbid. Finally, general ethical considerations that might arise from interacting in social networks where public and private spheres can be blurred, have to be clearly workout out (Bryer and Zavattaro 2011).

## Conclusion

Social media has quickly penetrated the realm of government operations. Over the past 15 years, government agencies have become expected to be available "online" almost 24/7. While this development offers enormous potential for governments, including increased connectivity and transparency, it also has many pitfalls. Social media channels can become platforms for challenging and undermining authority and spreading rumours, especially in times of crisis. For a government to be able to harness the potential of social media use, a well-designed policy must be in place. Metrics and performance measurements can help agencies determine the effectiveness of their social media use for achieving their organizational objectives and overall mandate.

# Social Network Theory

Marla A. Parker
Department of Political Science, California State University-Los Angeles, Los Angeles, CA, USA

## Synonyms

Social capital

## Definition

Structural dimensions of interpersonal or interorganizational relationships that drive the development of the social capital connected to the development and implementation of public mission and policy.

## Introduction

Social network theory describes how the various dimensions comprising the content and structure of socially connected entities interact. Additionally, the various concepts within the larger realm of social network theory explain how various outcomes result from the social capital (i.e., resources emerging from relationships) generated among a body of connections. More specifically, social network theory provides very useful insights into how the creation, changes, and flow of various resources depend upon the pathways among connections, which can have positive and negative impacts. In the context of public administration, public policy, and governance, social network theory provides a useful lens for understanding key activities such as mission delivery, collaboration, management, and more.

What follows is a more detailed description of major factors covered by social network theory and their various manifestations at macro and micro levels when using social network analysis. Then, there is a discussion of the practical application of social network theory to understand activity in public administration, public policy,

and governance. Finally, the conclusion discusses considerations for actually evaluating social networks.

## Dimensions of Social Network Theory: Network Structure and Content

Social network theory components generally cover two broad areas: structure and content (Burt 2000). Structure refers to the physical construction of a network. The structural building blocks of networks include the nodes (e.g., entities) and ties (i.e., connections among entities). Qualitative and quantitative characteristics describe the nodes and ties both individually and collectively. Examples of quantitative characteristics include network size (number of nodes and ties within a network), specific pathways of network ties, churn (changes in the number of nodes and ties), and clusters (groups of smaller networks within larger networks). Examples of qualitative characteristics include tie strength and weakness, node location and centrality, node demographics, node homogeneity and heterogeneity, and internal and external location of nodes in relation to a single node.

The content of social networks refers to the social capital generated among the connections. Social capital can include a multitude of resources (e.g., information, advice, skillsets, and technology) that also includes other types of capital (e.g., financial, political, and physical) (Portes 1998); however, its distinguishing feature lies in that such resources are obtained through social or relational connection rather than being self-generated or acquired through a structured transaction. Similar to the structural element of networks, the content also embodies quantitative and qualitative dimensions. Examples of quantitative dimensions may include level or quantity of social capital as well as the degree and directionality of resource exchange among ties. Examples of qualitative dimensions can include the specific type of social capital as well as homogeneity or heterogeneity of resources.

Micro and macro level analysis of the aforementioned network characteristics can occur among people, groups, units, organizations, or a combination of these entities (e.g., people within or across specific organizations). Information gathered about network structure and content can provide useful insights into power distribution, social outcomes, professional development, innovation, culture, decision-making, values, norms, and other phenomenon strongly influenced by relationships and social interaction.

The linchpin connecting network structure and content is the presence of trust between connected nodes. Trust facilitates the exchange of social capital whereby higher levels of trust can ensure significant exchanges of social capital, which can result in greater productivity, efficiency, and effectiveness. Various network characteristics can act as proxies for the levels of trust among network nodes. For instance, trust as a function of tie strength (or weakness) can be measured by following dimensions of ties: degree of socio-emotional bonds, frequency of communication, and length of time known. The following node characteristics may act as indicators of trustworthiness of network members: reputation, productivity, referrals by other network members and partnerships with other well-known network members. In short, without trust, the true value of social networks cannot be realized in practical application.

## Practical Application of Social Network Theory in Public Administration, Public Policy, and Governance

### Social Networks of Public Sector Organizations and Actors

Social network theory can explain the behaviors, decisions, actions, and subsequent outcomes (particularly the impact and value) of public sector organizations and actors. Network governance (including intergovernmental and intersectoral collaboration), public management, and policy innovation and diffusion are key areas in which social network theory demonstrates this. As such, public sector practitioners can leverage social network analysis to facilitate more effective and efficient mission delivery, organizational development, and policy activity.

Network governance and collaboration in the public sector provides an alternative to unilateral and single agency (or organization) approaches to mission delivery (Agranoff 2006; Provan and Kenis 2008). The basic premise is that collaborative units with multiple entities operating as a network can provide better and more impactful results by sharing resources, capitalizing on various strengths, and compensating for each other's weaknesses. Additionally, collaboration in the form of principle-agent configurations such as contracting is also popular in the public sector realm. From an internal perspective, social network theory may explain how collaborative units form through personal contacts, share capital, ensure accountability, and reinforce expectations through oversight by network members, ensure compliance, develop decisions, and share or concentrate power. From an external perspective, social network theory can measure how extensively a mission is implemented as a direct result of sharing and exchanging specific types of resources among organizations and people within them.

Public management provides multiple contexts for using social network theory (Meier and O'Toole 2001; O'Leary and Bingham 2009). For example, it can explain human capital development (e.g., hiring and recruitment) within organizations by identifying how the networks of personnel can provide access to labor pools. Additionally, it can explain how leadership positions with public organizations because of the developmental, advancement opportunities and supports within a worker's networks. The networks of public managers can also provide access to information about potentially useful managerial practices, location of important resources to support tasks, and connections to other powerful decision makers that can facilitate execution of tasks.

The political and informational dimensions of policy strongly reflect social dynamics, thus rendering it an ideal space for the application of social network theory. Political alliances and rivalries that can advance or deter policy initiatives may be strongly and positively correlated to the following dimensions of a policy network: size, tie strength (e.g., socio-emotional bond or communication frequency), and homogeneity of interests. Relatedly, the specific location of policy champion within or among a cluster of related networks can influence how extensively support for a policy initiative becomes diffuse, thus galvanizing necessary momentum. Information in the form of policy analysis results, case studies, lessons learned, strategies, and data provide necessary foundations for policy innovations and can flow among groups of policy actors, thus making networks a critical source for driving policy development and implementation. Moreover, networks have the potential to provide access to increased variety and in-depth information that may not otherwise be accessible.

## Social Network Theory to Understand Constituent Activity and Outcomes

Social network theory can also lend important insight into how the public reacts to and navigates administrative, governance, and policy actions by examining the networks of constituents. For example, social network theory can provide insights into how clusters of communities create mechanisms of resilience through resource sharing when faced with oppressive policy outcomes. The theory can also elucidate policy advocacy activity within and across communities by examining the flow of information and resources through networks of effected constituents. Social network analysis can also inform how constituents may process and spread policy messaging. Yet another example is how constituent network can result in greater or lesser degrees of civic engagement with public administrators and policy makers.

## Social Network Theory to Understand Undesirable Public Outcomes

The aforementioned discussion implies that network structure and content can provide positive outcomes. However, a close examination of network dynamics can also reveal undesirable outcomes. More specifically, certain configurations of network can upend public values in the administrative, governance, or policy realms leading to mitigated social justice, equity, and democracy. For example, the homogeneity of

certain demographic characteristics (e.g., gender, race, and class) among network nodes may result in unequal sharing of power and resources that reinforces marginalization of certain groups. Ideological homogeneity in networks may limit the development and proliferation of innovation that can benefit policy development and managerial practices. Small-size networks with weak ties to a strongly connected, large network may be at a disadvantaged with access to information and resources thus limiting equitable democratic participation. In short, understanding the barriers and opportunities created by social networks greatly depends upon the specific structure and content configuration.

## Conclusion

In addition to the unit of analysis, network characteristics, and social capital specifics, network evaluation in relation to a specific outcome should also consider timing and scale. Over time, network characteristics and social capital can evolve, contract, or stay the same in various ways, resulting in changes to the flow of and access to resources. Scale refers to whether or not an entire network universe (e.g., entire school system) or a portion of it (e.g., neighborhood schools). Different results may emerge if an entire network universe is considered as opposed to a portion of it.

Social network theory can inform practical approaches to improving public administration, governance, and policy practices by considering how social dynamics matter for the actions and behaviors of public sector actors and stakeholders. By understanding the nuances of network structure and content, actors and stakeholders may strategically engineer networks to facilitate better exchange and access to social capital, resulting in better public outcomes. Social network theory can also act as an evaluation tool of administrative, governance, and policy activities, particularly when determining how critical resources are distributed and applied. Both qualitative and quantitative methods can be used to assess networks and develop strategic plans. Additionally, social network analysis software exists, which can do simple to complicated structural calculations.

# Social Networks in African Universities

Peter Nareeba
Faculty of Social Sciences, Uganda Christian University, Kampala, Uganda

S

## Synonyms

Formal social networks; Informal social networks; Social support; Social ties

## Definitions

**Social networks** are a social structure of nodes that represent individuals or groups and the relationships between them within a certain domain.

They could be formal or informal connections that determine human relationships.

**Informal social networks** involve unorganized and unstructured systems of relationships or linkages among individuals, each with a varying degree of influence on social integration of students.

**Formal social networks** rotate around networks which are structured and organized with distinct clear roles and responsibilities.

## Introduction

Social networks pave a way for understanding behavior particularly in larger-scale complex societies. From a sociological perspective, human beings are social animals, hence social networking being inevitable. It is unavoidable among students as they interact to advance their ideals alongside the core objectives of the university. In pursuit of academic career, students join universities to benefit from such knowledge industry alongside those linkages. Such an environment has the potential to generate cohesiveness, cooperation, and trust. In Ugandan universities, both students and staff value their social capital as a yardstick for moving forward. Irrespective of its power, common integration in universities is still weak in sub-Saharan Africa and local viewpoint.

Social network platforms bring out the fact that individuals are not living and acting in isolation but rather are socially related. In today's global and technological society, social network platforms whether conventional (church organizations, students' associations, etc.) or technologically determined (social media platforms such as Facebook, WhatsApp, Google Plus, Blogs, Twitter, Instagram, MySpace, and YouTube) have a major influence on human relationships in such a way that they enable members of society to engage with each other in fundamentally new and different ways. For instance, traditional network platforms (such as students' organizations, associations, and church movements) create an environment with the potential to generate cohesiveness, cooperation, as well as trust among users, thereby profoundly advancing positive growth through social integration of students.

This is consistent with the educational and learning environment, particularly universities. They form platforms that contribute a lot to the manner in which students integrate, thus advancing their careers with ease. In Uganda, university administrators try to provide other informal platforms like the provision of common meal plans and other social events and extracurricular activities and church group meetings. This fosters interactions and links inside and outside the classroom setting.

## The Case of Uganda Universities

The Republic of Uganda Government requires that public institutions should reflect the global nature of society. This was a basis for Ugandan public universities' administration to come up with a national plan of social network platforms that caters for the multicultural and multiracial constitution of their institutions. The plan allowed universities to form students' management bodies and traditional platforms (organizations, associations, religious organizations, and other informal groups) for a dynamic social integration of students. These range from religious groups, football associations, swimming, music, dance and drama gatherings, and collaborations based on tribe and those based on faculty and course being pursued. These social network platforms are perceived to facilitate social interactions and promote unity in diversity among university students and effectively grow socially and intellectually.

Irrespective of this ideal, Ugandan universities face profound divisions, tribal and ethnical conflicts frequently experienced among students that undermine the intended goals of such social network platforms. These challenges include tribal and political tensions between student social and cultural association and students' frequent strikes which frustrate academic progress. Relatedly, Uganda is challenged by ethnicity which is found to be the most sensitive issue across a number of universities, given that there

are many diverse ethnic groups and races local as well as international. This undermines student and staff interactions among themselves. There is a common notion that students from some ethnic groups tend to keep to themselves because of similarity of culture, which leads to their self-isolation. This deepens the negative stereotypes and myths about different ethnic groups that are found to be common among institutions of learning, thus leading to tension, misunderstanding, and even exclusion.

University's employees and students create social networks that result from interface with beneficiaries, leaders, and other partners. They make contact by becoming members of religious groups, tribal units, age groups, and different academic clubs. The process of establishing such ties enables familiarization with the university's culture, economic conditions, norms, and values. While at the university, they associate with different institutions such as schools, the police, health centers, and non-governmental organizations. This enables them to identify areas of common interest that are vital for addressing their individual and societal challenges. The establishment of connections with different members of universities improves success in career progress. For example, in UCU, the Association of Born Again students bring together affiliated students to share Christian identity through assimilation into biblical doctrine irrespective of the academic profession. They meet regularly in the morning, lunch time, and evening to conduct prayers together.

This entry notes that exchanges with university members occur when students participate in activities such as meetings (formal and informal) with corporate leaders, political forums, and other information sharing sessions. Similarly, occasions such as university cleanup events, religious activities, national political campaigns, weddings, and burial ceremonies are avenues of interface. During such interactions, they share information about challenges in the university, concerns of the people, and factors that facilitate and constrain progress and are able to exchange information. They define and deliberate on how such a community's problems may be solved.

## Theoretical Underpinning

**The functionalist and gratification theory** (Katz et al. 1974) attempts to address the social functions within society, usually performed by the various social systems for the good of individual in society. The theory explains social institutions and organizations as collective shared places that meet individual social needs. In view of this entry, the theory helps in explaining why students and university administration choose particular social network platforms in the attempt to meet specific functions that satisfy the needs and desires of the members of their institutions. Modern network platforms like the Internet, for instance, have enabled students to find and also have more options from which they are able to select other websites and web pages that satisfy their specific concerns. Further, this theory gives reasons why students in public universities in Uganda prefer using (in terms of self-gratification) particular social network be it traditional or modern technological social network platforms in their social integrations. However, it is fundamental to indicate that this theory had the limitation of undermining or taking for granted the negative effects of the various collective social network platforms, particularly in their attempt to meet individual social needs. This lacuna led the researcher to further opt for the social network theory.

**The social network theory** (Lent et al. 2006) assumes that social relations are key in explaining both individual action and collective interactions. This study notes that relations which are perceived to be structural and more crucial for comprehensive behaviors rather than characteristics like gender, ages, ideology, and values foster collaborations that are vital for development. This tenet puts a lot of emphasis on ties or relations among actors in the network. Social networks are affected by beliefs, actions, and perception due to various structural approaches that determine the interests of those involved. The behavior of an individual in a university setting depends on behavior of other actors engaged in a social network. This may lead to exclusion of others in the social platform and opposition to any other social

relations and to other actors outside of one's own conclave. However, this theory lacks the wider international aspect of human relations to the extent that involved actors are perceived to operate almost in an isolated and in anonymous manner. This mishap informed the introduction of social integration theory as explained.

**Social integration theory** (Tinto 1993) posits that the interaction among members of society, either in a social organization or in a peer interaction in a social setup, advances the interests of a group. In the context of institutions of higher learning in sub-Saharan Africa, it is about all-inclusive participation that an academic or administrative staff or student has with university. This engages informal peer relations, semiformal communication with staff and faculty, and involvement in university and cocurricular activities. This is vital especially in assisting first-year students, for whom the adjustment to university in most cases is challenging and sometimes demanding. The theory assumes that there is always some basis on which humans make themselves open to embrace the other persons in society. This encourages reciprocal interaction of those engaged within their social structure. Such reciprocal relations or interactions have the fundamental elements of harmony, understanding, tolerance, and acceptance among university colleagues. The weakness of this theory is that social intercourse is associated with an individual's position in the social class and what the individual ascribes to himself/herself and how she/he perceives her-/himself in the social context. More so, the less educated, less organized, and less influential individuals and social groups are perceived to be less visible needing recognition. The conflict transformation theory comes in to address the shortfalls in the social integration theory.

**Conflict transformation theory** (Fisher 2000) rests on the assumption that conflicts in society are caused by problems of inequality and injustice and oppression by the domineering sociocultural and economic powers or groups. This theory looks at the process by which conflicts such as those that occur in higher learning institutions could be managed to yield peaceful outcomes. The theory appreciates that contemporary conflicts need much more than the reframing of positions and recognition of win-win outcomes. This theory helps to bring out the measures the university administration undertakes to contain students' conflicts that are sometimes created by the misuse of the social media platforms, particularly in accommodating the interests, values, and diverse perspectives of various groups for a relatively better understanding of the others in the institutional setup. The theory pays less attention to the measures undertaken by universities' administration in liaising with different students' leaders in resolving conflicts that seem to undermine social networks. Thus, this is the basis for this entry introducing the social capital theory.

**Social capital theory** (Putnam 1993) describes successful individuals as networking and trusting individuals who volunteer to help their neighbors and community with the expectation of long-term reciprocal benefit. This theory looks at the available human potential resources employed for the good of society. The assets stem from the social connections which individuals create, maintain, and develop within the social setup. The resources could be real or virtual that build up to an individual or group by virtue of mutual friendship and recognition in a social setup. In a university setting, this enables the realization of social cohesion and integration through the provision of social avenues with all the entailed resources (solidarity, material resources, etc.) for involved university staff and students.

## Conclusion

The entry concludes by noting the power of by belonging to different groups in universities which fosters collectivism. University staff and students that create positive relations with their colleagues in a university setting in most cases develop shared interests which enable them to identify opportunities and exploit them together, and at the same time, when challenges emerge, they are solved by their social networks, thus benefiting themselves. This study deduces that taking time to understand the nature of the university community and its activities and needs forms important foundations for networking among the different stakeholders in a university.

Participation in different university events helps university colleagues to meet key people and enables sharing information about their work, interests, and future directions. This allows the university community to appreciate the activities of the social networks which breeds ground for trust and social support toward their activities. The scholar concludes that cultivating positive relationships in universities creates platforms where students, lectures, and administrators talk to each other, listen to each other, and identify each party's strengths. Again, listening to university colleagues helps to determine priorities which fosters cooperation. This helps in the building of consensus and confidence in tackling the challenges in a given institution of higher learning.

## Synonyms

Frontline workers in Japan; Local social welfare offices in Japan; Social administration in Japan; Social policy and policy implementation in Japan; Social security system in Japan; The Japanese welfare state

## Definition

The institutionalized response at local governments to social and economic problems and risks, such as economic insecurity, inequality, and poverty, according to the development of an administrative state.

## Introduction

Rapidly aging and shrinking population is among the most serious challenges that Japan currently faces. Meanwhile economic and social disparities have expanded in the last two decades. The number of Japanese children born in Japan in 2019 will reach 864 thousand, falling below 900 thousand for the first time since statistics began in 1899, according to a Health, Labor, and Welfare Ministry report. ("The number of births in 2019 fell for the first time in nine hundred thousand, earlier than expected." (in Japanese) *Asahi-Shinbun*, December 24, 2019.) In addition, Japan's population aged 65 years and older is expected to exceed 30% in 2025.

These developments have caused observers to question the sustainability of Japan's social security system. Although both national and local social security expenditures continue to increase rapidly due to the aging of society, Japan's social security system faces a number of challenges, including providing sufficient nursing care and health care for the elderly, child-rearing support, and other welfare benefits. Local government plays an important role in social policy implementation not only as a follower of national redistributing policies but also as a gatekeeper of social policy.

Turning our eyes towards local welfare administration, this essay considers how and why local government works to realize the ideal welfare state and mitigate inequality. First is an overview of the Japanese welfare administration system. Next, previous studies regarding the welfare system in Japan are reviewed and followed by a

examination of both the characteristics of the reforms carried out as a response to the retrenchment of the welfare state and the characteristics of the Japanese welfare state that have persisted in spite of these reforms. The characteristics of the current Japanese welfare administration system are then discussed. After that, the importance of exploring the discretion of local government and the exercise of discretion by frontline local government officials are argued. Finally, this essay discusses major social, demographic, economic, political, and institutional challenges that Japan is facing, with a focus on the implementation of social policy at the local level, along with an exploration of the corresponding theoretical challenges that researchers face in analyzing this landscape.

## The Japanese Welfare Administrative System

Welfare policies vary from country to country and depend on the type of welfare state that each country establishes. Article 25 (2) of the constitution of Japan states that the State shall endeavor to improve and promote social welfare, social security, and public health in all aspects of life. In Japan, the definitions of social security and social welfare vary among advocates. Based on the social security council "Recommendations on Social Security Systems" (October 16, 1950), social security is here defined as comprising social insurance, social welfare, public assistance, and public health. Social welfare and public assistance are positioned as welfare policies. Social insurance is based on the principle of mutual aid and risk diversification, including pensions, medical insurance, and employment insurance. Social welfare supports the lives of the socially disadvantaged and should be borne by taxes. It is legislated for each target population, such as people with disabilities, children, single-parent families, the elderly, and the needy.

These various social security benefits are provided by the national government and local governments. According to the financial results for fiscal 2018, 34.4% of Japan's total (national and local government) 169.2 trillion yen budget went towards social security–related expenses. Of this portion, 70% was spent by local governments, excluding pensions, which are entirely covered at the national government level. As fiscal expenditures, local governments account for 57% of total government expenditures; it can be said that local governments account for a large share of social security expenditure (Ministry of Internal Affairs and Communications 2020).

Of the 2.74 million local government employees, 368,000, or 13.3%, are welfare workers. Welfare-related employees account for approximately 40% of the total general administrative sector (which excludes education, police, firefighting, and public enterprises). In particular, of the total 1,349,000 municipal employees, 311,000, or 23.1%, are welfare related (Ministry of Internal Affairs and Communications 2019). From these figures, it can be said that local governments play an extremely important role in the social security field.

Social security benefits consist of a combination of policy recipients and means of delivering benefits to them. The recipient of the benefit is prescribed by each law. Under the Public Assistance Act, the recipients are poor people; under the Child Welfare Act, they are children under 18 years of age; under the Single Mother and Widow Welfare Act, they are single parents; and under the Comprehensive Support Act for Persons with Disabilities, they are people with disabilities.

The means of providing benefits can be broadly divided into cash benefits and in-kind benefits. Cash benefits are further divided into grants and allowances, insurance systems, and loans. The responsibilities of providing and administrating benefits are shared among the national government, prefectures, and municipalities, as shown in Table 1.

As you can see from Table 1, social security administration is roughly divided as follows. The national government, i.e., the Ministry of Health, Labor, and Welfare (hereafter MHLW) is responsible for social insurance such as pensions and unemployment insurance, in which financial support plays a central role. The national government

**Social Policy and Administration in Japan, Table 1** Division of social security and administrative roles between the national and local governments

| Field | | Social insurance | Social welfare | Public assistance | Public health |
|---|---|---|---|---|---|
| National government | | Pension, unemployment insurance, and healthcare (medical license, drug license etc.) | | | |
| Local government | Prefecture | National health insurance, health care planning, and public hospitals. | Child welfare (abuse, temporary protective custody, etc.), issuance of disability certificates, payment for services and supports for persons with disabilities, and special child-rearing allowance benefit | Public assistance (towns and villages) | Public health centers, immunizations |
| | Municipality | Long-term care insurance | Child welfare (childcare support), welfare for the disabled, and elderly care | Public assistance (city) | Water and sewage, health centers, and public hospitals |

also carries out programs that are established under a country-wide, unified system such as health care. Most programs related to social welfare, public assistance, and public health are carried out by local governments because they are centered on personal services. Of course, the MHLW is also involved in designing programs that are carried by local governments and providing financial support. Prefectural governments are mainly responsible for highly specialized work and measures that should be implemented over a wide area. On the other hand, municipalities take various measures to implement the six welfare laws (public assistance, child welfare, welfare for the elderly, welfare for single parents, welfare for the physically disabled, and welfare for the mentally disabled), and childcare support, among others, is not handled by the MHLW or at the prefecture level. In addition, local governments do not only receive subsidies and realize a social security system designed by the national government, but also provide additional services as independent programs of local governments by making efforts according to the actual conditions of the area. For example, medical expenses are subsidized and long-term care prevention programs are provided. This is why social welfare in Japan is called "municipal welfare." This paper will focus on the welfare administration provided by local governments in Japan.

## The Previous Research on Japanese Welfare Administration System

Many studies have debated the development and current status of Japanese welfare states, in terms of political economy and comparative welfare regime perspectives (Esping-Andersen 1997, 2001; Estévez-Abe 2008; Kasza 2006; Kato 2003; Hall and Soskice 2001; Miura 2012; Miyamoto 2003, 2008; Lynch 2006; Peng 2000, 2012; Shinkawa 1993; Hall and Soskice 2001). Japan has been variably categorized as having "equally combined the main elements of both the liberal–residualist model and the conservative–corporatist model" (Esping-Andersen 2001: xiii), as a "familialist regime" (Shinkawa 1993), or as a combination of liberal, conservative, and social democratic regimes (Miyamoto 2008), with

these three characterizations drawing upon welfare regime theory, while also having been categorized as a coordinated market (CME) (Hall and Soskice 2001), drawing upon "varieties of capitalism" theory. Previous research has considered the Japanese welfare state as an amalgamation of small public welfare, private corporate welfare, the male breadwinner family model, age-oriented welfare, and low-productivity employment policies, such as protection and regulation of small- and medium-sized companies, and public works in local areas (Tanaka 2019).

An important theme that researchers have identified in the public and policy discourse is the nature of the Japanese welfare state as a "Japanese-style welfare society" supported by corporate welfare and family welfare. This discourse has been part of the ideology of LDP conservatives and describes the substantial characteristics of their policies. This approach to welfare policy differentiates Japan from other advanced Western countries that Esping-Andersen's model can be applied to describe. The term "Japanese-style welfare society" was used in Prime Minister Ohira's administrative policy speech in January 1979 during the period of low economic growth following the oil shock, and the Cabinet approved the "seven-year plan for a new economy and society." This idea of a Japanese-style welfare society consists of the following seven elements. One element is non-acceptance of Western welfare state models on the grounds that such approaches lead to the corrosion of family ties. Second is the emphasis on self-help efforts such as savings and life insurance. Third is the affirmation that living together with the elderly and their children are "hidden assets of welfare" in Japan, resulting in the emphasis on welfare by the family. Fourth is an emphasis on mutual aid provided by the local community. Fifth is continued support for corporate welfare represented by lifetime employment and seniority-based wages. Sixth is affirming the importance of the private sector and market systems. And last but not least is an emphasis on social security measures as a safety net in cases where self-help efforts and family welfare are not sufficient.

In his seminal work on Japanese welfare politics, Campbell (1992) focused on the development of Japan's social security policy, starting with the time when the welfare state was expanding in the 1950s up until the 1970s, through the reassessement and reform of these policies beginning in the 1980s to the 1990s. Campbell studied the decision-making processes in Japan that affecting policies addressing Japan's aging society, such as pensions, health care, and employment. Other research has explored why Japan failed in carrying out fundamental social and economic reforms designed to boost productivity, encourage the participation of women and immigrants in the workforce, and facilitate work-family balance in order to respond to the industrial hollowing out and women's declining fertility (Schoppa 2006). Using Hirshman's framework, Schoppa argued that individuals who wanted to have children but still continued to work and firms that wanted to escape from Japan's convoy system both exited from the political market. Kitayama (2011) analyzed national health insurance policy development from the viewpoint of historical institutionalism and examined the impact of local government on the development of the welfare state.

While a lot of debate over the trajectories of Japanese welfare state, such as formation and reform among others, has focused on political factors such as class mobilization, party politics, and institutional legacies, few studies have examined the characteristics of welfare administration and welfare implementation at the local government level, and intergovernmental relationships in the welfare field, which are all components of Japan's welfare state but may have different mechanisms due to local administrative systems. The notable exception is Campbell (1992), who discusses the free health care program for the elderly established by the Minobe administration of the Tokyo Metropolitan Government in the late 1960s. However, this movement to introduce free health care was limited in time and political context, when progressive, reform-minded, government leaders of prefectures and large cities emerged, and more progressive local governments expanded benefits as a whole in the era of

the old people boom. Thus, Campbell just examined the choices of local government as one actor in the political arena of national social security policy, while not considering the structure of the intergovernmental or local administrative systems, which have significant impact on the implementation of social security policy.

Of the limited research covering these topics, there is literature that examines welfare magnet theory as put forward by Peterson and Rom (1990) and investigates its explanatory power for the Japanese case, in terms of public choice. For example, Tanabe (1996) characterizes Japan's National Health Insurance system as a policy of redistribution between regions as well as redistribution between individuals, and that the welfare magnet theory does not apply in the case of Japan, considering the policy legacies such as the municipal system, linkage with the general account budget, and subsidies from national government. Second, there is some literature that focuses on intergovernmental relations (IGR) in the welfare field, in terms of finance and human resource management, among others. For example, Hiromoto (1996–1997) argued that by paying attention to the subsidies from the Ministry of Health, Labor, and Welfare, the relationship between the national and local governments in welfare administration is sparse, and that the national government is active in increasing the financial burden of local governments. Third, there is literature that examines political factors that affect the quality of welfare policies. For example, Park (2014) examined the case of Takanosu-machi, a former muncipality in the Akita Prefecture that attracted attention as a model for "the best welfare in Japan." In 2003 Takanosu-chohad a pivotal mayoral election in which whether the muncipality should merge with another was the top issue. The candidate that supported the merger was elected, and subsequently the area experienced a decline in welfare quality.

## The Change and Continuity of the Welfare Administration System

As has already been made clear, the end of economic growth after 1980 and the collapse of the bubble economy in the early 1990s led to major changes in the nature of the welfare state in Japan, as well as in the postindustrial societies of other developed countries. In line with this change, Japan's welfare administration system also changed.

The era from the late 1980s to 1990s was a period when the welfare policies were decentralized while the central government imposed local planning obligations. By reason of the financial constraints due to the oil crisis and the end of the high economic growth, the central government promoted administrative reform in the 1980s. As part of the central government's administrative reform, many administrative tasks of five of the six welfare acts, excepting the Public Assistance Act, such as those related to the placement of childcare and special nursing homes for the elderly, was shifted from being administered by central government to instead local government. As a result, the government's share of the financial burden had been reduced from around 80% to 50%.

In 1990, eight welfare-related laws were revised, and municipalities were required to perform many of the welfare-related tasks. The revisions included defining in-home welfare services. In addition, the government adopted the planned administration system both in order to improve the service provision infrastructure in response to the increasing welfare needs, and in order to control the quality of welfare work performed by local governments around this time. A 10-year strategy for the promotion of health and welfare for the elderly called the gold plan (10 years from FY 1990), a plan in the field of child welfare called the angel plan (5 years from FY 1995), and a plan for the disabled (7 years from FY 1996) were formulated, requiring local government to decide the direction of its policies while revising its plan. During this period, most of the welfare work was shifted to a system centered on municipalities, but that services were provided based on national standards did not change as local governments still relied on central government funding.

The era during the 2000s was the period of basic structural social welfare reform. In order to

cope with the declining birth rate and aging population, as well as increase the quantity and improve the quality of welfare services, the government aimed to change the three basic structures of social welfare that had developed since 1945 to this period. First, the government changed the welfare system from a safeguard system (*Sochi*) into a contract system. Before this reform, the government was required to provide the services, through compulsory administrative measured called "*sochi.*" Under the contract system, services are provided through contracts between the user and the service provider, allowing the user to select a service.

The second major structural reform was the introduction of the private sector's entry into the welfare service market. It can be said that the concept of NPM (New Public Management), which became in vogue in Japan at that time, was applied to the welfare field. Until at that time, only a limited number of organizations, such as local governments or social welfare corporations, had provided welfare services under the principle that welfare services should be provided by public entities. However, by promoting the entry of private businesses into the welfare service sector and systematically positioning nonprofit organizations (NPOs) and volunteers as welfare services, the government sought to respond to increasing demand for services and to improve the quality of services through the principle of competition among businesses.

The third structural reform was the promotion of decentralization. In 2000, the decentralization package law was enacted, and decentralization has since advanced not only in social welfare but throughout all policy areas. In order to ensure that welfare services are in line with local conditions, the role of local governments has been emphasized in the operation of the system, and local governmental authority in providing services and supervising business establishments has been increased, along with national funding transferred to local budgets. Specifically, the 1951 Social Welfare Services Act was revised through the 2000 Social Welfare Act, aiming to promote community welfare, expand the scope of social welfare services, and establish a system to protect users. In addition, the act made it obligatory for local governments to make an effort in drawing up community welfare plans. In 2000 the long-term care insurance system, in which municipalities are insurers, was also introduced. Childcare center admission became a contract-based system (1997), and the disability support fee system was introduced (2003).

In addition to these three major reforms, in order to respond to the diversification of welfare issues, a system was created to protect those who were disadvantaged for due to specific acts such as abuse by others. This system was established through the passage of the child abuse prevention law (2000), the domestic violence prevention law (2001), the elderly abuse prevention law (2005), and the disabled persons abuse prevention law (2011).

The term during the 2010s has been a period of pursuing inclusiveness, support for self-reliance, and community-based service. Due to facing an unprecedented low birth rate and aging population, it has been becoming increasingly difficult to cope with labor shortages, a shortage of welfare workers, and a tight fiscal situation. The government plans to raise the consumption tax, carry out comprehensive reforms of the social security and tax systems, raise the self-pay portion of insurance premiums and impose income restrictions. The issue of day care waiting lists for children has become a problem due in part to the promotion of women's participation in the workforce, and child poverty has become a problem due to widening disparities. In addition, an increasing number of families have multiple welfare issues, such as poverty, abuse, hikikomori (individuals who isolate themselves at home for 6 months or longer), and elderly care (The Ministry of Health, Labor, and Welfare website. https://www.mhlw.go.jp/seisaku/2010/02/02.html (Accessed on October 10, 2020)). Until now, the welfare administration in Japan has been structured according to the type of recipient, and the budget and staffing have been divided vertically. The problem was that there were too many vertical barriers and suboptimal cooperation between specialists and organizations in different fields. Inclusion is being pursued to improve service delivery efficiency and address complex challenges. In addition, in order to cope with the shortage of workers

and financial resources, support for self-reliance is provided so that people can live independently, prevention is emphasized so that intensive support is not required, and support is aimed at the local level.

The Act on Comprehensive Support for Persons with Disabilities (2012), the Act on Child-Rearing Support for Children (2012), the Act on Self-reliance Support for the Destitute (2013), and the Child Poverty Countermeasures Act (2013) were established in line with the above objectives. In addition, the Act on Promotion of Comprehensive Assurance of Medical and Long-Term Care (2014) was enacted to construct a community care system that comprehensively ensures the provision of efficient and high-quality medical and long-term care in communities.

These systems are built on the basis of local communities, so naturally, municipalities and prefectures play an important role. As a result of the second decentralization reform, local governments can now develop their own standards in a more flexible regulatory environment, such as in the designation of service providers and the standards for the operation of facilities. In addition to providing welfare services, local governments now have a certain degree of authority to regulate businesses.

As the national population continues to decline, policies continue to pursue inclusiveness, self-reliance, and community-based service. The goal is to realize a society in harmony with local communities from 2017 and to provide social security for all generations in 2019. The importance of local governments is expected to increase in the future in terms of how to involve people in the face of an overwhelming shortage of financial resources and a shortage of volunteers and other service providers.

While the major reforms of decentralization and marketization were carried out, it is important to note that the direction of the "Japanese-style welfare society" has not changed significantly, though some social support systems such as the long-term care insurance system, the child-rearing support system, and measures to cope with the declining birth rate have been introduced.

The four types of "Jo," which means "help" and is the final kanji "助" in the Japanese words for self-help, mutual aid, mutual assistance, and public support, are often used in the social welfare administration of Japan. Self-help (individuals) refers to the ability to solve one's own life problems on one's own initiative, while mutual aid (community ties) refers to the ability of people with personal relationships, such as family, friends, and club activity friends, to help one another to solve one's own life problems. Mutual assistance is institutionalized mutual aid. It refers to mutual assistance provided by insured persons, such as medical care, pensions, long-term care insurance, and social insurance systems. Public support (government) refers to a social welfare system that provides the necessary livelihood security in cases where self-help, mutual help, and mutual assistance are not sufficient.

Moreover, the introduction of the long-term care insurance system does not include financial compensation for family caregivers, and households are still required to support their families. At the same time, corporate welfare is said to be a family-style management that extends the family system to corporations, and has provided various welfare services such as retirement allowances, company housing, corporate pensions, and social insurance premiums on behalf of the public sector. In recent years, the burden on welfare recipients and their families has increased as the number of nonregular employees has increased since the 1990s and corporate welfare has declined. On the other hand, the unprecedented and rapidly declining birth rate and the aging of society has spurred the promotion of women's participation in society. While there are still many issues that remain to be addressed, company policies as they relate to women, such as the establishment of a system that enables greater work-life balance for women (and in principle men as well), have changed cultural perspectives from viewing women as needing the protection of men in a male breadwinner society to interacting with women as workers.

Furthermore, in relation to family welfare, most of the provision of social welfare services in Japan is carried out on a household basis. Each household receives welfare benefits, medical insurance, and pensions. Some people do not receive welfare benefits because they are referred

to their families for support when they apply for benefits. This also impedes children on welfare from going to college and contributes to what in Japan is sometimes referred to as the "8050 problem" in which older parents, often around 80 years old, support their adult hikikomori offspring, who are around 50 years old.

Forty years have passed, and the social situation has deteriorated with the declining birth rate, the aging population, the growing fiscal deficit, and the lost 30 years. As the Japanese-style welfare state faces the same reform pressures as other developed countries, and as welfare decentralization and NPM reforms proceed, government responsibility will recede and the burden will be placed on communities, families, and private actors. As a result, new discrepancies have appeared and local governments have to coordinate the various actors involved in welfare service provision to tackle these tensions.

## The Characteristics of the Japanese Welfare Administration System

At present, there are five main characteristics of the social welfare administration system in Japan based on the "Japanese-style welfare society" (Hori 1981). The first is the use of public funds in the social insurance system. The second is a lack of emphasis on frontline workers having expertise in providing welfare services. The third characteristic is there are not only profit-making corporations and social welfare corporations but also various intermediate organizations and individual volunteers involved in providing social welfare services. The fourth characteristic relates to the particular administrative challenges in the application system. The fifth is that, in many cases, council systems (*shingikai*) are used to determine the direction of the administration, draw up administrative plans, and implement them accordingly (Yamaguchi 2016).

First, the Japanese social welfare is the public expense burden of the social insurance system. In many countries, insurance premiums are the sole source of revenue for the insurance system, but in Japan there is a tax burden. National subsidies, contributions from prefectural governments, and transfers to the general account (national health insurance) fund many insurance policies, such as employment insurance, medical insurance (national health insurance and employee health insurance), long-term care insurance, and pension insurance. Although this has the effect of alleviating inequalities between regions, it is a unique system that does not adhere to the logic of the insurance system because, despite compulsory social insurance, the implementation of related insurance projects and premiums may be affected by state subsidies, making the relationship between burden and benefits unbalanced.

The second characteristic of Japanese social welfare is that the staff of welfare offices and their supervisors engage in frontline work with little consideration given to staff having relevant expertise or qualifications. In Japanese local governments, caseworkers in the administrative and welfare professions are mixed, with the former predominating. They are hired simultaneously by local governments and transferred to different government departments every three to four years. The welfare department is often an unpopular place to work, so new employees are placed there and sometimes they quit. As a result, in the context of interpersonal services, the bureaucratic behavior of frontline staff may be more intense, with them exercising greater control over clients (Hatakeyama 1989). As a result, organizational management in the workplace is very difficult.

The third characteristic of Japanese social welfare is that semi-governmental organizations and individuals, such as social welfare corporations, social welfare councils, and welfare and child welfare commissioners, play a major role. Based on the social welfare law, social welfare corporations are public interest corporations engaged in social welfare services that require the approval of the relevant authorities, are given preferential tax treatment, and have long been the center of social welfare services in Japan. Although a social welfare council is a private social welfare corporation, its relationship with local governments is very close because local government employees are allowed to serve as directors, and there were many local government retirees and employees on loan. Since the introduction of the nursing care insurance system, social welfare councils

often provide nursing care services and carry out community welfare activities in areas where the number of NPOs and private nonprofit organizations has been low.

A welfare commissioner is a volunteer, part-time, and special civil servant who is commissioned by the Minister of Health, Labor, and Welfare on the recommendation of a prefectural governor based on the Welfare Commissioners Act. Welfare commissioners and commissioned child welfare commissioners were formerly district commissioners under the Relief and Protection Act. The welfare district commissioner exercised considerable authority in public assistance before World War II, but has officially become more of a government support position after the war. However, some local governments are still asking for welfare commissioners to do more, such as when there are few other welfare workers. The commissioners will carry out activities in each of the municipalities and provide advice, information, and assistance to residents so that they can live independently. Due to urbanization, many local governments have become less connected to each other, making it difficult for welfare commissioners to carry out their work, and the aging of their members has become a problem. In 2016, the position fill rate across the nation was 96.3%, though some regions "only" achieve 80%. Compared to their more comprehensive pre-war exercise of authority, today welfare commissioners have increasingly focused on specifically watching over the elderly and assisting those in need perform a variety of small, daily tasks (changing light bulbs, taking out the trash, etc.). Although the number of profit-making corporations participating in the provision of social welfare services has increased as a result of the basic structural reform of social welfare, the roles of these organizations are still significant in light of the declining birth rate and aging population.

The fourth characteristic of Japanese social welfare involves two major administrative challenges in the application system. One challenge is whether the right of the recipient to receive welfare services is guaranteed in practice. The other major challenge is whether the potential recipient actually receives services.

Originally, an application was defined as an act for the benefit of citizens and residents based on national laws, ordinances, and local ordinances and regulations. In order to guarantee the rights of the people and residents, the government will have to respond to the request. When administrative resources, i.e., financial resources and manpower, are limited, insufficient information may be provided, or applications may be rejected or withheld at welfare windows, coping activities referred to in Japanese as "border operations." The fact that the percentage of people receiving welfare benefits in Japan is the highest in Osaka City at 5.07% and the national average is 1.66% (March 2019), which is much lower than in other countries, is also a sign of lack of consistent administrative guarantee. Such responses by the administration is an example of a discrepancy between the guarantee of legal rights and the operation of such rights.

In addition, from the perspective of the citizens and residents, the application system itself may hinder their willingness to receive welfare benefits. The administrative response is cold, the system is complicated, there are many documents, and even though people think of applying because they need help in the first place, they are exhausted at the application stage and give up. Culturally, Japan still has a strong stigma when it comes to receiving welfare services, and many fatherless families do not apply for such services. As described below, there is almost no research on welfare administration in Japan, a serious gap in the literature that would be valuable to fill.

The fifth major characteristic of the social welfare system in Japan is that the direction of local government policy formulation is decided by the chief executives of local governments upon consultation with the council (Shingikai), and the implementation of policies is secured by administrative plans. There are two types of councils: those that are required by law and those that are established by local governments through ordinances. The latter plays a more active role than the former. In addition, since the 1990s, with the aim of securing a system for providing welfare services as described in the historical background, local governments have adopted an administrative

method in which targets are set in plans and implemented. At first, plans centered on the elderly, but now over 15 plans have been developed to address various fields such as child-rearing, disability, single-parent families, and medical care.

## Discretion of Local Governments in Welfare Administration and the Size of Their Role

As discussed above, although the privatization of welfare services has progressed since the basic structural reform of social welfare around 2000, local governments, especially municipalities, continue to play a major role in welfare administration. Municipal welfare policies cover a wide range of areas, including the provision and management of direct welfare services, the regulation and supervision of private welfare services, the planning of local government policies, and the coordination of multiple sectors. As the declining birth rate and aging population exacerbate fiscal constraints while there remains a shortage of welfare workers, provision of welfare services must be carefully prioritized. The question is how to provide the necessary services to those who need them most, and how to properly provide safety nets.

The work of local governments is considered to be carried out within the framework of the national social security system, but local governments can exercise two major forms of discretion. First, local governments have a lot of discretion in carrying out welfare policy. While some recent literature has begun to examine this area, more research is needed to study local politics and relations between local and national government.

Second, frontline officials can exercise a substantial amount of discretion as they directly interact with residents. As mentioned in the previous section, the personnel in charge of welfare administration in Japan often do not have related formal qualifications or expertise. Although frontline employees in welfare administration are expected to play both roles as a bureaucratic agent of the state and as an agent of the citizen (Maynard-Moody and Musheno 2003; Zacka 2017), the Japanese system emphasizes the state aspects and not becoming client oriented, but instead directing the client in compliance with the application system. Overseas studies have found that such government responses reduce clients' sense of effectiveness. In addition, as will be described later, there are cases in which clients cannot be helped unless frontline employees from different fields can cooperate effectively with each other.

Little is known about the principles of behavior of frontline staff in Japan. Some research has examined the relationship between frontline workers and their supervisors, and how this relationship is affected by organizational controls. Hatakeyama (1989) performed early research exploring these relationships across a variety of frontline employees in Japan, while Tanabe (1987–1988) Takechi (1996) and Seki (2014) focused on public assistance case workers, and Suzuki (2019) further honed in on frontline workers who handled child abuse cases. However, with a few exceptions (Arami 2014, 2015), little research has been done on how Japan's frontline employees relate to their clients and how they behave when frontline operations are privatized. Research in this area is urgently needed given the impact these behaviors can have on the delivery of services, although several studies dealing with hybridization in street-level bureaucracy research have been explored abroad.

## Recent Issues

There are three main challenges facing Japan's present welfare administration system. First is the declining birth rate and aging population, resulting in a fundamental financial, staffing, and other strains on the system. Due to the declining birth rate and aging population, many social security systems created during the era of rapid economic growth are suffering from institutional fatigue, and their sustainability is in danger. In 2025, the baby-boomer generation will be especially older adults over 75 years old, and in 2040, the population of Japan will be about 110 million, with 1.5 workers (in the working-age population)

will support 1 elderly person. The population aged 85 or older will account for nearly 30% of the total elderly population, and the elderly population will become even older. In addition, the generation that was unable to obtain stable employment during the employment ice age will continue to grow old and the elderly will become increasingly impoverished. More than 40% of elderly households are single person, and the elderly are becoming increasingly isolated.

In addition to generation imbalances, regional imbalances are also significant. Due to the declining population in rural areas, there are fewer places to work, and the population is increasingly concentrated in Tokyo, which is the most difficult place for the working generation to raise children.

It is said that the system will collapse if all of the medical, nursing, and pension systems are not reformed, but it has yet to be fully reformed. In addition, the government is trying to make up for the population decline by promoting the active participation of women, but the number of people who have children is not increasing due to insufficient support systems for child rearing and work-life balance, such as the day care waiting list for children. The government has announced a plan to reform the social security system for all generations, but the question is how to resolve the tax burden. While the social security system is in crisis, the tight fiscal situation has a great impact on welfare administration, which is directly connected to the residents.

Second, there is a shortage of welfare workers. Despite the need to further support child rearing and work-life balance, there is a continuing shortage of childcare workers and few caregivers. The number of local government employees has also decreased, and the number of nonregular workers has increased, resulting in a shortage of workers at local government offices. Moreover, despite the increasing incidence of child abuse, there is a problem of staff burnout due to the lack of professionals involved. In some areas, there is a shortage of doctors and hospitals.

In addition, the number of people who support people in need of assistance is decreasing due to the aging of the local population. Since 2017, the government has been aiming to realize a "my problem is our problem" society in which local communities support each other in promoting an engaged citizenry and strengthening professional skills. The government is now trying to encourage more elderly people to volunteer to help maintain their healthy age. However, such efforts are not enough to resolve the tax burden and redistribution issues.

The third challenge is multi-agency, cross-sector collaboration. As can be seen from the historical background, the welfare administration in Japan has developed in the form of expanding the number of people subject to welfare in each field. As a result, there is a strong sense of factionalism among both administrative agencies and specialists, and they have not been able to deal with issues that span multiple fields or that fall into a vacuum in the system. In order to address this challenge, many inter-agency meetings are being held in an effort to foster collaboration, though even a cursory glance at staff schedules raises concerns about the frequency of such meetings being excessive. It is necessary to improve collaboration between local government employees in different agencies and private welfare service providers.

The impact of the declining birth rate and aging population cannot be resolved by reforming social welfare administration alone. Reforms are needed in other related areas such as in the rollout of the national ID system, in the family registration system, in the mechanisms of providing individual public services, and in the personnel and organizational management of local governments.

## Conclusion

This essay explored the Japanese administrative system including its organization, funding, and institutions, with a particular focus on the performance of local government. It then described the historical origins of how role sharing between the national and local governments developed, shedding light on how local government plays an important role in the implementation of contemporary Japanese welfare policy. This essay also examined the theoretical development of research

on local Japanese government social policy, a field constructed with a traditional attention to intergovernmental relations regarding finance and personnel. I argue that frontline workers play a vitally important role and that these issues should be further studied. I then described the characteristics of Japanese welfare administration at the local welfare office. Finally, this essay discussed looming challenges. In order to address such issues as the shortage of financial resources, a decrease in the number of welfare staff (and volunteers), and factionalism among multiple agencies, it is necessary to resolve the issue of tax burdens, promote interagency cooperation, enhance the capabilities of local welfare officials, and better manage private service providers. It is also necessary to reform the basic structure of public services beyond social welfare administration. In light of all these considerations, local government's role as a gatekeeper of social policy will likely increase in efforts to overcome these challenges. Local officials need to improve their abilities so that people can lead independent lives with peace of mind.

## Historical Perspective

Brazil was one of the pioneers in the introduction of social protection schemes in Latin America. To that end, the first law was enacted in 1923 (covering railroads workers). Coverage was progressively expanded to other professional categories – commerce in 1934 and industry in 1936 (SSA/ISSA 2017). By the 1970s, virtually all professional categories had been included in the law (Brumer 2002). Its main characteristic was the delivery of social protection almost exclusively through social insurance, that is, a contributory form of social protection, usually related to labor force participation in the formal market.

The norm in Latin America was the development of a radical form of conservative welfare regime (Esping-Andersen 1996), and Brazil was no exception. Conservative welfare regimes in the developed world – fundamentally based on social insurance – tend to promote limited decommodification of the labor force and to largely reproduce the stratification of the labor market. In Latin America, these features were taken to the extreme by the high levels of informality in the labor market (Barrientos 2004), leaving large parts of the population uncovered.

In Brazil, social protection was exclusively delivered through social insurance until the early 1970s, when the first semi- (virtually non-) contributory schemes were introduced, targeting the poor elderly, people with disabilities, and smallholder farmers. These schemes used to pay flat-rate benefits at a lower level than the basic contributory pension by the age of 70 (or irrespective of age, in case of disability) and only to one

person per household (which led to a strong gender bias, since men are, on average, older than women).

The post-democratization Constitution of 1988, enacted at the end of a decade of low economic growth, significantly improved the existing semi- and noncontributory benefits. Their benefits were raised to the same levels as the basic contributory pension. Age of eligibility for rural pensions decreased dramatically (from 70 years old to 60 for men and 55 for women). The age of eligibility for the new old-age social assistance benefit decreased progressively and reached the age of 65 in 2003. Benefits started being paid to all household members that met the eligibility criteria, that is, the limit of one benefit per household disappeared completely. This change eliminated any gender bias. Moreover, the new Constitution also determined the delivery of health services on a universal basis; defined the reduction of poverty and inequality as one of the country's main priorities; and emphasized administrative decentralization, with municipalities having a more significant role, which eventually influenced the emergence of conditional cash transfers.

This mix of contributory and noncontributory benefits eventually led to a high old-age coverage (defined as the percentage of people aged 65 or older who received a pension or a social assistance benefit). In the early 1990s, old-age coverage was around 80 percent. As a consequence of the aforementioned changes, old-age coverage was already above 85 percent in the second half of the 1990s and almost 90 percent in the mid-2000s. Coverage increased particularly among women (an increase of almost 13 percentage points between the early 1990s and the mid-2010s compared to roughly 4 percentage points for men over the same period).

Old-age coverage is much higher than coverage of the working force (defined as the percentage of the employed population aged 16–59 that is covered by any social insurance scheme), which was slightly above 70 percent in 2014. The working population that was not covered by a social insurance scheme did not have any access to social protection until conditional cash transfers emerged in the mid-1990s.

The Constitution's new emphasis on administrative decentralization eventually had an impact on reshaping social protection in the country. In the mid-1990s, the first experiences with conditional cash transfer programs (CCTs – see definition in the next section) emerged at the local level, in the municipality of Campinas (in the state of São Paulo) and in the Federal District (Lindert et al. 2007). Other municipalities also adopted the same type of program. The Brazilian local experiences were relevant for Mexico to enact a national-level CCT (Progresa – later rebranded Prospera) in 1997. In Brazil, a few years were necessary for the federal government to enact three CCTs to operate in the whole country in 2001. These CCTs operated in uncoordinated fashion during almost 2 years, until in 2003 they were eventually merged into the *Bolsa Família* Program, which became the largest program of its kind in the world.

Overall, the social protection system in Brazil is more diversified now than in the early 1970s. Noncontributory benefits, which simply did not exist back then, now reach not only the elderly and people with disabilities but also the working-age poor and their children. However, expenditures on noncontributory benefits remain very low when compared with expenditures on contributory benefits – a clear sign of the conservative character of the Brazilian social protection system.

## Current Structure

The Brazilian social protection system has high vertical coverage (ILO 2010), that is, it covers all typical social risks that social security is expected to cover, and offers a relatively wide range of benefits. Old-age, disability, and survivor pensions; sickness, work injury, and maternity benefits; unemployment insurance; and family allowances are all provided by the system, in addition to health services (see Table 1).

Civil servants and private sector workers are covered by different social insurance schemes ("Special Regime" and "General Regime,"

**Social Policy, Brazil, Table 1** Social protection in Brazil: audience, coverage, benefits, financing, legal, and institutional references

| Regime/ programme | Contributory social protection | | Non-contributory social protection | |

*Source*: Author's elaboration

respectively), whose rules have started to converge since 2003. Semi-contributory benefits aimed at smallholder farmers are considered part of the General Regime. Only workers in the private sector are covered by unemployment insurance, since civil servants can only be laid off under very specific circumstances. Both regimes pay earning-related benefits (except for the scheme that covers smallholder farmers, which pays flat-rate benefits at the level of a minimum wage). Both are also financed through a pay-as-you-go scheme (i.e., the contributions

of active workers finance the benefits of current pensioners).

The General Regime pays 28.3 million old-age, disability, and survivor pensions, while the Special Regime for the federal government pays roughly 1 million pensions.

These regimes are supplemented by a social assistance scheme that grants means-tested and flat-rate benefits (*Beneficio de Prestacao Continuada* – BPC) to elderly people (men and women aged 65 or older) and to poor people with disabilities, irrespective of age, also at the level of a minimum wage. These benefits are financed by general taxes and cover 4.5 million people.

*Bolsa Família*, a CCT program, is the most recent and last component of the Brazilian social protection system. CCTs are generally defined by four characteristics: they (i) deliver cash (not in-kind) transfers; (ii) to families (not individuals); (iii) through a targeting mechanism (limiting the payment to poor households); and (iv) conditioned to certain behaviors by beneficiary households (usually regular school attendance for children and periodical visits to health clinics). The goal is not only to alleviate poverty but also to improve long-term prospects for children through educational and health conditionalities.

As it is a targeted benefit, *Bolsa Família* covers fundamentally working-age poor people and their children. The benefit amount varies as a function of the household size and poverty level, but the average value (R$ 187 per family per month, in 2018) is substantially lower than any other social protection benefit in the country. The program currently reaches more than 14 million households.

From an administrative point of view, there are four sets of institutions responsible for managing the social protection system. The federal government, individual states, and roughly 2000 local administrations (from a total of 5570 municipalities in Brazil) manage their own Special Regimes, under the same rules. The National Social Security Institute (*Instituto Nacional do Seguro Social* – INSS) manages benefits for the General Regime (which also covers municipalities that do not have a Special Regime) and the BPC. There are INSS offices in 1500 Brazilian municipalities. The unemployment insurance is administered by the National Employment System (*Sistema Nacional de Emprego* – SINE). Finally, *Bolsa Família* is managed by the National Social Assistance System, an arrangement between the three levels of government (central, state, and local), operating in all Brazilian municipalities.

Overall, expenditures are still very concentrated on social insurance benefits (see Table 2). Their cost in 2016 was 13.3% of GDP, against 1.2% of GDP for social assistance benefits (BPC and *Bolsa Família*). In other worlds, non-contributory benefits continue to have a minor

**Social Policy, Brazil, Table 2** Expenditures with social protection benefits as a percentage of GDP in Brazil, 2016

| | In R$ billion | % of GDP |
|---|---|---|
| Social security benefits – civil servants (A) | 273.0 | 4.4% |
| Social security benefits – private sector (B) | 507.9 | 8.1% |
| Unemployment insurance (C) | 37.0 | 0.6% |
| Abono salarial (D) | 17.3 | 0.3% |
| Social assistance benefits (old-age; disabled) (E) | 47.4 | 0.8% |
| Bolsa Família | 27.5 | 0.4% |
| Total | 910.0 | 14.5% |
| Social security benefits (A + B) | 780.9 | 12.5% |
| Passive employment policies (C + D) | 54.3 | 0.9% |
| Social security and employment policies (A + B + C + D) | 835.2 | 13.3% |
| Social assistance benefits (E + F) | 74.8 | 1.2% |
| GDP | 6259.2 | |

*Source*: Author's elaboration based on own calculations

impact in the social protection budget, while social insurance benefits represent the bulk of expenditures.

From a legal perspective, both social insurance benefits and the BPC are defined in the Constitution and have specific legislation. Pension reforms have been relatively rare since the Constitution was enacted in 1988, largely because constitutional amendments are politically difficult to achieve. Reforms in 1998 and 2003 produced relatively limited results: the 1998 reform failed to set a minimum pensionable age for private sector workers (Caetano et al. 2016), and the 2003 pension reform affected only civil servants. This explains why Brazil has been an outlier in terms of pension expenditures, when compared with other countries with similar demographic characteristics, and long-term forecasts suggest an unsustainable increase in these expenditures over the coming decades (Caetano et al. 2016).

## Impacts

Social insurance and the BPC have been effective in protecting the elderly population from poverty. Ninety percent of people aged 65 or older receive a benefit of some kind (either contributory or noncontributory). The poverty rates for the elderly are four times lower than the country average and more than seven times lower than poverty rates for children (Paiva 2016). In other words, the Brazilian social protection system has been effective in reducing poverty for the elderly.

Conversely, the poverty rate for children aged 0–15 years is still much higher than the country average, despite the effectiveness of the *Bolsa Família* program over the past 15 years. The program has been an efficient tool in the fight against poverty and inequality, reducing extreme poverty by 25 percent and explaining roughly 15 percent of the decrease in the Gini coefficient after 2000 (Soares et al. 2010; Hoffman 2013) – unprecedented since the Gini started being measured in the mid-1970s. However, the relatively modest value of its transfers still prevents the program from being even more effective.

*Bolsa Família* also had demonstrable impacts on school attendance rates and school progression (Brazil 2012), as well as on several health indicators, including under-5 mortality rates (Rasella et al. 2013). Allegations that cash transfers could have a negative impact on labor supply and a positive impact on fertility have not been corroborated by the empirical evidence (Batista de Oliveira and Soares 2012; Simões and Soares 2012). These results are in line with those observed in several other countries and for different CCTs (Bastagli et al. 2016).

Social protection benefits are also expected to have an impact on the economy. Mostafa et al. (2010) estimated multiplier effects above 1 for the *Bolsa Família* program (1.44), the BPC (1.38), and social insurance benefits paid by the General Regime (1.23), meaning that a unitary increase in expenditures on these benefits would produce an impact larger than this nominal increase in the country's GDP.

Overall, the country's social protection system provides quasi-universal old-age coverage and protects the elderly against poverty, through a combination of contributory, semi-contributory and noncontributory benefits. Higher poverty rates among those aged 0–15 are a clear sign that the system has been less effective in protecting the working-age poor and their children. These groups have to rely exclusively on the *Bolsa Família* program, which reaches a large number of households but pays very modest cash transfers.

The rising costs of the social protection system – fundamentally driven by pension expenditures – seem to be unsustainable and suggest that a strong pension reform is inevitable in the near future.

## Synonyms

*Agency*: Free will; *Cognition*: Awareness; *Coherent*: Consistent; *Typologies*: Classification

## Definitions

| | |
|---|---|
| *Competing Values Framework*: | Commonly used to assess business culture (Cameron and Quinn 2006). |
| *Dynamogenesis*: | Triplett's theory concerning whether competition affected individual behavior or if the mere presence of others did (Goethals 2003). |
| *Epistemological*: | The theory of knowledge, especially about its methods, validity, and scope. Epistemology is the investigation of what distinguishes justified belief from opinion ("epistemological," n.d.). |
| *Field theory*: | When combined, internal and environmental forces influence behavior of people and the lens through which they see their world (Goethals 2003). |
| *Genotypic*: | Adjective for genotype; the genetic makeup of an organism or group of organisms regarding a single trait, set of traits, or an entire complex of traits ("genotypic," n.d.). |

| | |
|---|---|
| *Moral disengagement*: | A term from social psychology for the process of convincing the self that ethical standards do not apply to oneself in a particular context. This is done by separating moral reactions from inhumane conduct and disabling the mechanism of self-condemnation ("moral disengagement," n.d.). |
| *Social facilitation*: | Observing that the presence of others enhanced the performance of the individual (Goethals 2003). |
| *Social psychology*: | Examines human behavior as influenced by others and the social context in which this behavior occurs (McLeod 2007). |

## Introduction

While psychologists focus on a micro approach to examine individuals, sociologists take a macro view of the landscape in which we live. Social psychology serves as the bridge connecting these two fields of study (Katz and Kahn 1978). It examines human behavior as influenced by others, the social context in which this behavior occurs, and our interactions (McLeod 2016). "What is relevant to social psychology is directly relevant to organizations" (Dashtipour 2015, p. 189). Numerous and varied types of organizations turn to social psychology to better understand culture, leadership, identify systemic problems, examine communication, strategic direction, conflict, performance, and other areas within the enterprise.

Organizational conduct and, more specifically, the people within them have increasingly become case studies for social psychology of organizations and are frequently reported in traditional and social media (Stangor 2016). Understanding how individual behaviors affect the group, how external factors impact the overall organizational behavior, and how malfeasance becomes normative are keen areas of study within social psychology of organizations (Staw 2016).

## History of Social Psychology

As a field of study, social psychology emerged in the late nineteenth century (Dashtipour 2015; Stangor 2016). In the mid to late 1800s, Steinthal, Lazarus, LeBon, and Tarde placed an emphasis on collective thinking, group mind, and suggestibility where individual thought gave way to the communal group to which the person belonged. Personality developed because of group, community, and cultural influences. Individual, rational thought subjugated to the will of the group (Dashtipour 2015; McLeod 2007). In 1895, Triplett conducted the first experiments in social psychology examining how competition and the presence of others affected an individual's performance as compared to when the person was alone. Through his theory of *dynamogenesis*, Triplett questioned whether it was competition or the mere presence of others that affected behavior (Goethals 2003).

In the early 1900s, William McDougall's *An Introduction to Social Psychology* created the foundation of a new discipline, separating it from sociology and general psychology. McDougall posited that social behavior was grounded in biology, innate and instinctive and therefore individualistic (McLeod 2007). At the same time, E.A. Ross's *Social Psychology* focused on the power of suggestion and imitation, where people influenced the thoughts and behaviors of others as applied in religion, marriage, crowds, social movements, and class (Goethals 2003).

In the 1920s, Floyd Henry Allport changed the focus from the group mind perspective to examining individual behavior since it is individuals who think, behave, and feel (Dashtipour 2015). Taking a methodological and investigatory

approach, Allport proposed examining behaviors that were observable. While Ross and McDougall's work laid the foundation for social psychology, Allport ushered in the field as we know it today (Goethals 2003). He stressed that this field was a "science . . . which studies the behavior of the individual in so far as his behavior stimulates other individuals, or is itself a reaction to this behavior" (1942, p. 12). Allport coined the term *social facilitation* observing that the presence of others enhanced the performance of the individual, but Gustave Le Bon would later posit that persons within groups lose their identity becoming highly suggestible and an uglier version of themselves (Goethals 2003). Allport dealt with topics such as emotion, conformism, and the impact of an audience's presence on individual behavior. Topics are still relevant today (McLeod 2007).

By the 1930s, social psychology was firmly established as a scientific discipline (Goethals 2003). Kurt Lewin would eventually become a giant in the field and is often considered the *father of social psychology* (McLeod 2007). Using his *field theory*, Lewin posited that when combined, internal and environmental forces influence behavior and the lens through which people see their world (Goethals 2003).

During the 1940s and 1950s, Lewin and his protégé, Leon Festinger, advanced the investigative and experimental approach to study behavior, thus solidifying social psychology as a rigorous scientific field. As an editor of *Research Methods in the Behavioral Sciences*, Festinger along with other social psychologists is called for rigorous measurement and use of laboratory experiments to test hypotheses about social behavior (Stangor 2016). Additionally, Muzafer Sherif conducted experiments that examined conformity, obedience, and influence, experiments that would impact the orientation of the field and set the stage for new examination (Hepburn 2003).

In the 1960s and 1970s, two now infamous experiments demonstrated conformity pressures in group settings and how the authoritative role could induce obedience even at the expense of causing severe harm to others (Stangor 2016). Using experimenters, confederates, and theatrics, participants were encouraged to administer painful or dangerous levels of shock to supposed learners as part of a study on punishment in Milgram's Shock Experiment. The number of participants who willingly followed the experimenters' order even though they knew the shock was harmful confounded the researchers (Milgram 1963). The study received much criticism for its deception in design and lack of ethical standards. As a result, strict research procedures endorsed by the American Psychological Association and administered by the U.S. federal government were put into place (Goethals 2003). The Stanford Prison Experiment (Haney et al. 1973) recruited a group of young men and randomly assigned a role of prisoner or guard. Almost immediately, participants adapted to their respective role with "guards" became aggressive, abusive, and exceeding boundaries, while "prisoners" became subjugated and contrite. The behavior of those appointed guards escalated in viciousness, while prisoners displayed mental, physical, and emotional anguish. Both the Milgram and Stanford Prison Experiments demonstrated the power of social influence, allowing the phenomenon to be observed and tested (McLeod 2007). During the 1970s and 1980s, how people behaved within the context of an organization was explained through a theoretical lens using psychology, sociology, and economics (Staw 2016).

Since the 1980s, social cognition has been the dominant tradition in social psychology where cognition enables people to make sense of others and themselves. How we process, store, and apply information about others and social situations play a vital role in how we think, feel, and relate to the world around us and others within it (Greenwood 2014).

## Organizational Typologies and Cultures

The mission, structure, culture, and legal formation of organizations differ greatly. As human constructs, organizational environments differ based on the motives and behaviors of the individuals who work within them (Katz and Kahn 1978). "Organizations come in a variety of

shapes, sizes and types, including for instance, governments, armies, religious denominations, charities, and businesses" (Brief and Smith-Crowe 2016).

Organizations also have a genotypic function where it performs as a subsystem of larger society. Four such genotypic functions include productive or economic organizations that provide goods/services such as corporations, maintenance organizations that focus on the socialization and training of people such as schools and churches, adaptive organizations such as research labs or universities, and managerial-political organizations that focus on the coordination and control of human and other resources such as national and state governmental agencies, military, labor unions, and special-interest groups (Katz and Kahn 1978).

Organizational cultures, though less complex than cities or countries, are social systems rooted in anthropology, sociology, and psychology. Culture is the unwritten rules that inform accepted and unaccepted behavior within the organization and is examined through shared values, geography, group behavior, and individual behavior (Gupta 2009). It is the totality of attitudes, customs, roles, norms, values, and beliefs that distinguish one group from another. Cultural differences between geographies cannot be overestimated as behaviors between east and west are markedly different (Staw 2016). Over the past two decades, the views of culture in psychology and sociology have converged. Culture is no longer viewed as static and coherent but a fluid and dynamic construct (DiMaggio and Markus 2010). Additionally, utilizing the competing values framework, Cameron and Quinn (2006) devised four cultural categories including clan, adhocracy, market, and hierarchy. Clan culture functions like a large family environment. Adhocracy culture is similar to an entrepreneurial environment with risk taking and revenue growth. Market culture is competitive with an emphasis on getting the job done, and hierarchy is a formalized and structured work environment. People shape culture and, in turn, culture shapes people. Organizational culture is comprised of individuals, who despite their personal value system alter their thoughts and behaviors to fit in, accepting the new normal. A poignant example of cultural loyalty is the solidarity of the men and women in law enforcement. The understood credo is that the people in blue take care of each other, support each other, and in subcultures do not turn on each other even if there is wrongdoing (Ashford and Anand 2003).

## Social Psychology: Theories and Perspectives

The definition of social psychology depends on the epistemological, theoretical, and geographical perspective of the person queried (Dashtipour 2015). According to Harre (1997), social psychology is juxtaposed between conflicting perspectives: one that seeks to explain the causal and universal explanation for human behavior and the other the context-specific thoughts and behavior underscored by culture and language.

Two important social psychology theories that are essential for business leaders include *observational learning theory* and *social contagion theory*. As its title suggests, *observational learning theory* is based on behavioral modeling. A leader's behavior outweighs his/her verbal messaging because conduct, good or bad, is emulated by personnel. S*ocial contagion theory* suggests that behaviors can spread like a contagious virus affecting worth ethic, manners, approachability, and a host of other organizational behaviors (Plante 2013).

"Many phenomena in organizations have their theoretical foundation in the cognition, affect, behavior, and characteristics of individuals, which through social interaction, exchange, and amplification – have emergent properties that manifest at higher levels" (Kozlowski and Klein 2000, p. 15). Depending on theoretical perspective, explaining these phenomena can vary greatly.

Given the broad collection of theories and perspectives on social psychology, readers who desire a more comprehensive understanding of this topic should refer to the *Handbook of Theories of Social Psychology* (Van Lange et al. 2011).

This book explores more than 50 theories on social psychology providing a deeper understanding on the subject.

## Social Psychology of Organizations

Social psychology of organizations is concerned with understanding organizational phenomena, challenges, and matters of organizational life. Examining social psychology of organizations is accomplished using qualitative, quantitative, and mixed methods of research using real-time, observational, and archived data. More than psychology research, context is the primary focus of the study where researchers examine upward, outward, and downward influences within the organization (Staw 2016).

Wilde (2016) posited that when workplaces lose their humanity, they become toxic environments adversely impacting the effectiveness of the individuals working within them, the organization, and society. Toxicity can begin at the individual behavioral, cognitive, and emotional level with motivation and ego. Moral disengagement can occur at both the individual and group level, where self-regulatory processes fail and unethical actions can be justified by euphemistic labelling. Such labelling enables denial of a victim or wrongdoing (Ashford and Anand 2003). This ability to disengage explains a broad spectrum of atrocities and behaviors that society deems reprehensible yet occurs in military situations, corporate malfeasance, and organizational corruption (Moore et al. 2012).

Healthy organizations inculcate a sense of purpose and mission and acknowledge the contribution of its members (Wilde 2016). When an organization's culture is misaligned to its core ideology and desired results, it must undergo assessment to alter employee thoughts, behaviors, and emotional states. Perspective taking may provide an additional filtering process where incentives and accountability can motivate behaviors. It involves an active, cognitive process where participants examine through empathetic reasoning, the views of others in the organizations (Ku et al. 2015). Without adjustment, individual thought, behavior, and emotion may maladaptively align to the group's creating atrocious outcomes.

According to Zimbardo (2007), when sufficient social or organizational pressure is applied, even a person with clear ethical standards can do bad things. Zimbardo asserted that while society tries to explain abhorrent behavior as the result of wayward individuals, it is not the individual but the environment and the people within it that foster bad behavior.

The Milgram and Stanford Prison Experiments demonstrated just how far people were willing to go to obey authority figures. Yet while results proved alarming, these experiments could be terminated, evaluated, and reconstructed. Such is not the case in the real-world context of sanctioned torture, widespread corporate malfeasance, unbridled power, and brutality. This behavior occurs within the ranks of those we trust and depends on to uphold the law, or turn to for succor, only to receive abuse. Incidents of such occurrence appear frequently in the headlines, providing a glimpse into the social psychology of organizations when things go wrong. Conversely, there are examples of altruism, heroism, and good citizenship that emerge because of the people and/or leadership within the organization. However, little research focuses on the collective good of an organization as we benefit more from examining which behaviors and practices to eliminate (Staw 2016).

By examining social psychology of organizations, we learn how and why individuals can modify their beliefs and behaviors to accommodate the group and its impact on the organization. Social psychology of organizations may begin with the individual and his or her agency. It is the incremental actions of a singular person that can manifest into significant evil for the company (Brief and Smith-Crowe 2016). When individuals experience power working in organizations, behaviors such as self-assertion, creativity, and risk taking change (Galinsky et al. 2006; Brief and Smith-Crowe 2006). As the self-serving goals of the individual increase, the needs of others and the organization diminish. The individual becomes rude and may undertake unethical

behavior (Staw 2016). According to Brief and Smith-Crowe (2016):

> Research on wrongdoing in organizations falls into one of two categories: either under-socialized, roughly where individuals are assumed to essentially follow their self-interest in a social vacuum, and over-socialized, roughly where individuals are assumed to enact the assumptions, values, beliefs, and norms of the groups in which they are embedded. (p. 6)

Positions of power convey authority, setting the tone for what is acceptable and expected, regardless of collateral damage. The greater the power, the less likely others will express opinion or dissention (Locke and Anderson 2015). Authoritative figures can be incompetent, unethical, or antithetical to the culture of the organization but will go unchallenged.

Having power does not have to be synonymous with deviant behavior, provided leaders can recognize the needs of others and possess compassion (Staw 2016). In some situations, having power can translate to a sense of responsibility for others, the organization, and accomplishing the mission, traits desired from world leaders (Tost 2016). Effective leadership is not defined by tyrannical force but rather the skills to inculcate zest and enthusiasm for the organization's vision and mission (Staw 2016). Moreover, if measurements that hold people accountable are monitored by others or carefully constructed incentives are put into place, there is less likelihood of error and/or bad behavior.

## Productive Organizations: Corporations

Within organizations such as corporations, there are inherent bias where managers overpromise on goals to position themselves for promotion. Executives responsible for these managers will typically deflate estimates recognizing this inflation. Likewise, similar bias exists, where companies exaggerate or use hyperbole about their products, expected results, or optimistic projections (Staw 2016). It is not that a corporation sets out to deliberately to do wrong. It is an aggregation of behavior or behaviors over time that sets the stage and seemingly recruits actors to play their parts. By their pyramid design, with less and less seats at the top, organizations serve as a host of competitiveness among contenders for executive seats. Work coexists alongside politics, with staff aligning alongside of their candidate. By examining these hierarchies, we can understand how an organization can undertake good or evil (Brief and Smith-Crowe 2016).

Employee response to questions vis-a-vis job satisfaction will differ depending on who is administering the questions. Asked by the management, one response is recorded; asked by a union representative, an alternate answer is provided; or asked by a colleague, still another response is given (Staw 2016). The myriad dynamics that comprise an organization suggest that understanding the social psychology of organizations is a complex field of study.

Although it occurred more than 30 years ago, we still discuss the catastrophic event afflicted by Union Carbide in Bhopal, India. More than 40 tons of methylisocyanate gas leaked affecting more than 600,000 lives. While eight Indian executives were convicted of negligence, the more important aspect of examination is to understand how such behavioral malfeasance could occur (Brief and Smith-Crowe 2016). In more recent times, the financial debacle of Enron, WorldCom, and the ruin of Wall Street companies in 2008 left us to wonder how an entire organization could either complicity go along with bad behavior or apathetically turn a blind eye. Antecedents such as incentives, motivation, time pressure, sense of camaraderie, accountability, power, and other factors serve as cognitive and behavioral catalysts (Ku et al. 2015). In addition to following a leader's bad ethical behavior, employees can be seduced by socialization with peers to surrender their ethics for the perceived rewards or seeing participation as an evitable part of their job. Indeed, non-willing participants can be shamed or made to feel guilty because they are not team players when corrupt practices are normative and nonparticipation seen as harming the organization (Brief and Smith-Crowe 2016). Yet not all malfeasance is born of bad intention. Indeed, a substantial number of ethical violations develop

because misguided employees try to help the corporation or the team.

The recent events at Wells Fargo Bank, where employees set up fake accounts to achieve goals, may speak to this phenomenon. If we set aside those employees who sought individual compensation, there are employees who cheated to help their branch, department, or division achieve its goal. Whether to help meet sales goals, thwart layoffs, and/or avoid bankruptcy, misguided errors in judgment can be construed as corporately endorsed and the wrong behavior occurs as a group (Brief and Smith-Crowe 2016). In the 2010 Tour de France race, those who played a crucial role had high self-expectations and were dependent on their peers, superiors, and subordinates to carry the race and were far more likely to use illegal, performance-enhancing drugs (Brief and Smith-Crowe 2016). When the overarching mission of the organization becomes paramount in the minds of its members, the means can justify the ends. What may not have been an acceptable behavior before becomes the new normal, where people look to others for signs of what is expected of them.

Leaders, departmental heads, or others in a position of power can greatly influence employee commitment to a course of action that translates to the very survival of the company, project, or venture. People within the organization become so enmeshed within the ideology that leaving is not considered a viable option (Ross and Staw 1986). Though sometimes a losing course of action, employees erroneously follow along with the group, even if it leads to disaster or the demise of the entity. Conversely, new product breakthrough, public service, or philanthropy as in Salesforce, Microsoft, Tesla, Google, or Apple require further research to explain and understand the occurrence of positive group behavior (Brief and Smith-Crowe 2016; Staw 2016).

> There are at least three major ways that psychological forces can influence the behavior of organizations: (*a*) Autonomous agents can represent the organization to outside publics; (*b*) powerful members can influence organizational structures, reputations, and performance; and (*c*) the aggregation of individual traits, emotional states, and beliefs can shape organizational attributes and behavior. (Staw 2016, p. 12)

While boards and leadership within organizations may articulate a vision for the organization, such vision can be easily sabotaged by employees who tacitly nod in agreement only to collectively drag their feet during implementation (Staw 2016). Contagious behavior within the organization can stem from one individual and radiate out to groups and the entire corporation. External incidents may also impact the organization, and the effect will trickle down into the employee base. In either scenario, by understanding the event, we may have greater insight into the subsequent behavior (Morgeson et al. 2015).

## Maintenance Organizations

Over the millennia, churches have played a vital role by offering spiritual guidance, providing succor, and helping millions of faithful find answers to life's deeper questions. Yet U.S. Catholic Church officials admitted that several key administrators systematically covered up the predatory behaviors of pedophile priests, harming generations of followers (Miller and France 2002). Summoned before a United Nations committee, the Vatican addressed questions about how it has handled the crisis of priests who raped and molested tens of thousands of children and the bishops who covered up for them. With more than 2500 priests sanctioned and nearly 850 defrocked, the Catholic Church has acknowledged that the culture at the time allowed this to happen (Associated Press 2014). It is hard to fathom how an institution that should represent the bulwark of goodness, propriety, and morality could serve as a host to such egregious acts and corruption. To perhaps understand how such corruption can become normalized in the minds of the offenders and institutionalized, we turn to Ashford and Anand (2003):

> There are three pillars that contribute to the normalization of corruption in an organization: (1) *institutionalization*, the process by which corrupt practices are enacted as a matter of routine, often without conscious thought about their propriety; (2) *rationalization*, the process by which individuals who engage in corrupt acts use socially constructed accounts to legitimate the acts in their own eyes; and (3) *socialization*, the process by

> which newcomers are taught to perform and accept the corrupt practices. (p. 3)

In the instant case of child abuse within the Church, by failing to acknowledge and deal with the problem, the Church as an institution obfuscated the issue by *transferring* the abusers rather than purge them. While the objective might have been to maintain the reputation of the Church, the inability to confront the issue and correct it effectively gave tacit permission to the perpetrators. The lie that the problem was being dealt with became the internal truth. The three pillars (Ashford and Anand 2003) worked independently and collectively reinforcing each other.

## Political Organizations

The images of Abu Ghraib shocked Americans, and the world as soldiers smiled for the camera alongside the victims they tortured and denigrated. Outraged citizens wanted to understand whether these soldiers acted unilaterally or upon the orders of commanding officers. While finger-pointing laid blame outside the circle of power, low-level, enlisted men and women were tried for the atrocities. Then vice president Dick Cheney (2011) would later claim that it was a few bad apples, not indicative of a rotten barrel. Yet psychologist Zimbardo (2007), chief architect of the Stanford Prison Experiment, disagrees and testified at military hearings.

The torture of detainees by U.S. soldiers at Abu Ghraib prison in Iraq was the result of systemic failure and culture. When soldiers put on their uniform, they are essentially being given a license to kill (Zimbardo 2007). Once home, the uniform comes off and, along with it, their license. In Abu Ghraib, there was perceived anonymity and the lack of any personal responsibility for the events. Soldiers believed they had the tacit approval of military commanders. Under conditions of war, the enemy is dehumanized. Once this occurs, the lack of identifying another person as human enables the evil side within us to emerge allowing us to commit egregious acts (Mbugua 2005).

## Conclusion

Social psychology of organizations is a complex field of study. It incorporates multiple disciplines, theories, and perspectives of those who study behavior of individuals and groups inside organizations and work settings. Social psychology and organizational context are inextricably linked. In this way, researchers examine upward, downward, and outward behavior within the organization to recognize the resultant phenomena produced as a result of the individual and group thoughts and actions.

# Social Work and Governance

Emmanuel Janagan Johnson
Social Work Unit, Department of Behavioural Sciences, Faculty of Social Sciences, The University of the West Indies, St. Augustine Campus, St. Augustine, Trinidad and Tobago

## Synonyms

Leadership; Social care governance; Social policy; Social work

## Ensuring Quality Outcomes Through Social Care Governance

Social work services are moving toward greater integration with governance. Governance arrangements are essential within the social work environment in the fields of Medical Social Work, Psychiatric Social Work, Social Welfare, Community Development, School Social Work, National

Security, Family Planning, etc., to ensure quality services and statutory responsibilities of social workers to deliver the services more efficiently and effectively.

## Key Principles of Care Governance

The key principles of social work care governance is to involve service users/care givers and the wider public in the development of quality care services, ensuring safe and effective services, appropriate staff support and training, striving for continuous improvement with effective polices and processes in place, and ensuring accountability and management of risk.

## Ethics and Values

A major characteristic of a profession is its ability to establish ethical standards to help professionals identify ethical issues in practice and to guide them in determining what is ethically acceptable and unacceptable behavior (Reamer 1998). Social work has developed a comprehensive set of ethical standard. For example, "social workers' handling of confidential information, sexual contact between social workers and their clients, conflicts of interest, supervision, education and training, and social and political action" (Reamer 1998, p. 2). The Code includes a mission statement, which sets forth several key elements in social work practice, mainly the social workers' commitment to enhancing human well-being and helping meet basic human needs of all people; client empowerment; service to people who are vulnerable and oppressed; focus on individual well-being in a social context; promotion of social justice and social change; and *sensitivity to cultural and ethnic diversity.* Social workers clearly have an ethical responsibility to be culturally competent practitioners (Gibelman and Schervish 1997). The Code recognizes that culture and ethnicity may influence how individuals cope with problems and interact with each other. What is behaviorally appropriate in one culture may seem abnormal in another. Accepted practice in one culture may be prohibited in another. To fully understand and appreciate these differences, social workers must be familiar with varying cultural traditions and norms. Clients' cultural backgrounds may affect their help-seeking behaviors as well. The ways in which social services are planned and implemented need to be culturally sensitive to be culturally effective.

## Cross-Cultural Knowledge

Cultural competence is not static and requires frequent relearning and unlearning about diversity. Social workers need to take every opportunity to expand their cultural knowledge and expertise by expanding their understanding of the following areas: "the impact of culture on behavior, attitudes, and values; the help-seeking behaviors of diverse client groups; the role of language, speech patterns, and communication styles of various client groups in the communities served; the impact of social service policies on various client groups; the resources (agencies, people, informal helping networks, and research) that can be used on behalf of diverse client groups; the ways that professional values may conflict with or accommodate the needs of diverse client groups; and the power relationships in the community, agencies, or institutions and their impact on diverse client groups" (Gallegos, pp. 7–8). Consult with supervisors and colleagues for feedback and monitoring of performance and identify features of their own professional style that impede or enhance their culturally competent practice evaluate the validity and applicability of new techniques, research, and knowledge for work with diverse client groups (Norton 1978).

## Service Delivery and Empowerment and Advocacy

Social workers shall be aware of the effect of social policies and programs on diverse client populations, advocating for and with clients whenever appropriate. Culturally competent social workers are keenly aware of the deleterious

effects of racism, sexism, ageism, heterosexism or homophobia, anti-Semitism, ethnocentrism, classism, and xenophobia on clients' lives and the need for social advocacy and social action to better empower diverse clients and communities. As first defined by Solomon (1976), *empowerment* involves facilitating the clients' connection with their own power and, in turn, being empowered by the very act of reaching across cultural barriers. Empowerment refers to the person's ability to do for them while advocacy implies doing for the client. Even in the act of advocacy, social workers must be careful not to impose their values on clients and must seek to understand what clients mean by advocacy. Respectful collaboration needs to take place to promote mutually agreed-on goals for change. Social workers need a range of skills and abilities to advocate for and with clients against the underlying devaluation of cultural experiences related to difference and oppression and power and privilege. The empowerment tradition in social work practice suggests a promotion of the combined goals of consciousness raising and developing a sense of personal power and skills while working toward social change. Best practice views this as a process and outcome of the empowerment perspective (Gutiérrez 1990; Simon 1994). Social workers using this standard will apply an ecosystems perspective and a strengths orientation in practice. This means that workers consider client situations as they describe needs in terms of transitory challenges rather than fixed problems. According to Gutiérrez and Lewis (1999), empowerment is a model for practice, a perspective and a set of skills and techniques. The expectation is that culturally competent social workers reflect these values in their practice.

## Diverse Workforce

Social workers shall support and advocate for recruitment, admissions and hiring, and retention efforts in social work programs and agencies that ensure diversity within the profession. Increasing cultural competence within the profession requires demonstrated efforts to recruit and retain a diverse cadre of social workers, many of whom would bring some "indigenous" cultural competence to the profession as well as demonstrated efforts to increase avenues for the acquisition of culturally competent skills by all social workers. Diversity should be represented at all levels of the organization and not just among direct practitioners. The social work profession has espoused a commitment to diversity, inclusion, and affirmative action. Social work client populations are more diverse than the social work profession itself. In many instances, service to clients is targeted to marginalized communities and special populations, groups that typically include disproportionately high numbers of people of color, elderly people, people with disabilities, and clients of lower socioeconomic status. Matching workforce to client populations can be an effective strategy for bridging cultural differences between social worker and client, although it cannot be the only strategy. The assumption is that individuals of similar backgrounds can understand each other better and communicate more effectively (Jackson and López 1999). Yet, an equally compelling fact is that "the majority of clinicians from the mainstream dominant culture will routinely provide care for large numbers of patients of diverse ethnic and/or cultural backgrounds. Clearly increasing the numbers of culturally diverse social workers is not sufficient. Even these professionals will need to be able to provide care for patients who are not like themselves" (Jackson and López 1999, p. 4).

## Professional Education

Social workers shall advocate for and participate in educational and training programs that help advance cultural competence within the profession. Diversity needs to be addressed in social work curricula and needs to be viewed as central to faculty and staff appointments and research agendas. The social work profession should be encouraged to take steps to ensure cultural competence as an integral part of social work education, training and practice, and to increase research and scholarship on culturally competent

practice among social work professionals (Davis and Donald 1997).

## Language Diversity and Cross-Cultural Leadership

Diversity skills, defined as sensitivity to diversity, multicultural leadership, acceptance and tolerance, cultural competence, and tolerance of ambiguity, constitute one of the core leadership skills for successful leadership (Rank and Hutchison 2000). Social workers should come forth to assume leadership in empowering diverse client populations, to share information about diverse populations to the general public, and to advocate for their clients' concerns at interpersonal and institutional levels, locally, nationally, and internationally. With the establishment of standards for cultural competence in social work practice, there is an important need to standardize cultural competence in social work practice for the profession to provide on-going training in cultural competence and to establish mechanisms for the evaluation of competence-based practice. As the social work profession develops cultural competencies, then the profession must have the ability to measure those competencies. The development of outcome measures needs to go hand in hand with the development of these standards.

## Social Work and HIV/AIDS

HIV left untreated leads to AIDS. It is transmitted mostly by blood and bodily fluids. In order to help people living with HIV/AIDS, they should be encouraged to live successfully with their disease and always seek new information as this is the primary way for a person with HIV to live their life to the fullest. Being a social worker is not all about forms and procedures, but at the heart of it all is the need to help another human being overcome a hard ship or difficulty that they are experiencing in their lives.

Through education society is trying to be as "fair" to persons living with HIV/AIDS as possible, there is still that underlying stigma and discrimination being exuberated toward individuals diagnosed with HIV/AIDS. Although the suggestions are ideals it does not always happen. To date people are still being discriminated against. Whiteside (2008) suggests that HIV/AIDS "was and remains stigmatizing at an individual and national level." In light of this, there is information on people living with HIV but some people refuse to accept it while other do not understand or do not believe it. In closing, education of the masses and vigorous awareness programs must be one of the main focuses of the relevant Government Ministries in an effort at ending discomforts of people living with HIV. A recent study conducted by (Patrice-Coy et al. 2016) revealed that female adolescents were highly aware of HIV/STDs-related facts.

## Social Work and Resiliency

Resilience is concerned with the interplay between risk and protective factors in order to determine behavioral and mental health outcomes for adolescents. It is the child's ability to cope and even thrive after trauma and overcome tough experiences. Some examples of risk factors for transactional abuse are economic, social and cultural factors, family instability, trauma, poor ability to problem solve, family violence, high family conflict, and low family bonding. Some protective factors which can be employed to buffer the effects of the risk factors stated are sex education, hopefulness, high monitoring and supervision, support from a caring and understanding person, stable housing, positive role models, and parental involvement. Furthermore, research suggests that interactions with peer and social relationship are prime ways for adolescents to reduce stress and promote metal health (Edmond et al. 2006; Werner 1992) and argue that high resiliency develops as a direct result of correlation between individual, family, and community protective factors.

## Social Work – Policies and Legal Systems

The term "social policy" is an ambiguous or unclear one and has different connotations, as

it refers to both the range of policies developed in response to social problems and concerns, and is concerned with four main areas (Thompson 2005): housing, education, health, and personal social services. The legal and institutional infrastructure is thought by service providers to compromise the safety of victims, when children are taken away from abusive homes without adequate resources for safety and follow-ups (Reid et al. 2011). Social Development, the Judicial system, Ministry of National Security, Child Line, the Children's Authority, all these agencies are there as a measure of assistance for the helpless. They all have policies and protocols by which they follow, in cases where the victims can access when referred to by the court. According to Rampersad (2010) there is a lack of trust in the legal system and police (who may themselves be engaging in underage sexual relations), and it is not because people are unaware of the law, but rather the perception at community level is that people are aware of the law and some simply choose to neglect it.

## Legislations on Equality and Diversity

The Equality Opportunity Act 2001 (as amended) is a new piece of legislation that prohibits discrimination of persons on grounds of sex, race, ethnicity, origin, marital status, religion, or disability and includes the prohibition of discrimination in relation to employment and provides for an Equal Opportunity Commission to receive, investigate, and decide upon claims of discrimination. Part III of the Act deals specifically with employment discrimination. In respect of persons seeking employment, an employer is prohibited from refusing or omitting to offer employment to a person based on the above grounds of discrimination. Also, an employer shall not discriminate against an employee with regard to terms and conditions of employment, opportunities for promotion, transfer or training or any other benefit, and facility or service associated with the employment (www.legalaffairs.gov.tt/Laws_listing.html).

## Social Work and Ageism

The National Policy on Gender and Development seeks to incorporate gender analysis into reforms of social protection measures for the elderly. Social protection measures will be more efficient if the differences in risks experienced by women and men are accurately understood. The experience of growing old differs for men and women in our society in many ways. The general goal of this policy is to promote the equitable and sustainable well-being of older men and women. It supports the initiatives of the Division of Aging. National Policy on Ageing, which also seeks to promote the sustainable well-being of the elderly, as well as their social integration into the mainstream of society. This policy addresses gender considerations within pertinent issues, such as social security, income security, participation, social inclusion, standards for care facilities, health services, housing, education and training, support networks, and legislation. The Equal Opportunity (No. 2) Bill 2011 seeks to amend the Equal Opportunity Act Chap 22:03 by prohibiting discrimination on the grounds of age and a person's HIV/AIDS status (tt.Parliament.org 2012). The UK's Employment Equality (Age) Regulations 2006 now makes it an offense for employers to discriminate against workers under 65 on grounds of age. However, employers in the UK are among the best in the world at recognizing the value of older workers and are doing more than any country examined in the report to recruit older workers back into the workplace. Can we say the same for Trinidad and Tobago? (Ali 2006).

## Social Work and Governance Related to Persons with Disability

The National Policy on Persons with Disabilities was approved (in Trinidad) in December 2005 based on consultations with disability organizations, the general public, and government as well as key international documents. There is an explicit policy for the employment of persons with disabilities in Trinidad and Tobago as well

as some key areas to support employment – legislation, access to the built physical environment, public transportation, access to information and communication (Henry 1998). The Equal Opportunity Bill also imposes a duty on an alleged discriminator to make adjustments as are reasonable for disabled persons, unless such adjustments would impose unjustifiable hardship (The Equal Opportunity Bill (No. 2) 2011).

## Social Work and Social Support

Social support has also been defined as the physical and emotional comfort given to us by our family, friends, coworkers, and others. It knows that we are a part of a community of people who love and care for us, value, and think well of us. It is the "sum of the social emotional and instrumental exchanges with which the individual is involved having the subjective consequence that an individual sees himself or herself an object of continuing valued in the eyes of significant other" (Gordy 1996). Social support means the sum of all the relationships that make a person feel as if he/she matters to the people who matter to him/her. Social support can come in many different forms. With regards to the content of support, some researchers have distinguished effect, affirmation, and aid as types of support (Abbey et al. 1985). Cohen and Wills (1985) identified esteem, informational, social companionship, and instrumental support; Eggert (1987) focused on emotional, instrumental, informational, and appraisal support. Although there are certain distinctions among these approaches, all types of support are perceived to have an emotional component. This study focused on the emotional component of support in line with Beehr's (1985) view that emotional support involves the provision of sympathy as well as behavior that shows care, liking, and willingness to listen.

Social support has been called a "meta-concept" made up of three subconstructs: appraisals of support, network resources, and supportive behaviors (Vaux et al. 1987). Appraisals of support are often understood by analyzing perceptions and receipt of support, while network resources investigate the social network surrounding the focal individual and their embeddedness in that network. Supportive behaviors are codified as the source of support or the relationship the supporter has with the focal individual and the type of support in question (House et al. 1988).

Social support may take different forms, such as emotional or instrumental support. Furthermore, it can be either perceived or received support. Perceived support refers to support expected to be available in a stressful situation, whereas received support pertains to whether someone actually did receive support in a stressful situation. The assessment of perceived support is most common. In contrast to actually received support, some authors (Sarason et al. 1990) consider perceived support to be a personality trait, a sense of attachment, and do not only understand it as "resources provided by others." Both types of support need not necessarily be closely associated with each other, and they may have different effects on well-being.

Princeton University, Princeton, NJ, USA
George Washington University, Washington, DC, USA

## Synonyms

Ethical Investment; Financial Social Responsibility

## Definitions

Corporate Social Responsibility in the finance domain emerged from Socially Responsible Investments (SRI). Historically, grown out of ethical and religious concerns on the market place. Today, SRI is practiced around the world. Most novel extensions are green funds and carbon divestiture in the light of climate change.

## Introduction

In recent decades, ethicality has become subject to scientific scrutiny in the management and business literature. Research described Corporate Social Responsibility (CSR) codes of conduct and compared social responsibility practices in the international arena. CSR business cases outlined success factors of corporate social conscientiousness. Corporate social engagement was empirically linked to corporate financial performance and related to investments (Puaschunder 2010).

With the emerging stream of literature on CSR, the finance community concurrently started paying attention to ethical considerations of the asset issuing entities. The consideration of Corporate

Social Responsibility in investment decisions is the basis for Socially Responsible Investment (SRI). SRI is an asset allocation style, in which securities are not only selected for their expected yield and volatility, but foremost for social, environmental, and institutional aspects. The most common forms to align financial investments with ethical, moral, and social facets are socially responsible screenings, shareholder advocacy, community investing, and social venture capital funding. Screenings integrate the evaluation of corporate financial and social performances into portfolio selections. Positive screenings target at corporations with sound social and environmental responsibility. Negative screenings exclude entities featuring morally and ethically irresponsible corporate conduct. Shareholder advocacy is the active engagement of shareholders in the corporate management by voting, activism, and dialogue. The majority of shareholders exercise their voting rights by proxy resolutions, in which a third party has the right to advocate for the shareholders before the corporate board. Negative shareholder activism comprises political lobbying, consumer boycotts, stakeholder confrontation, and negative publicity. Community investing describes ear-marks of investment funds for community development, but also features access to financial products and services to un(der)served communities. Social venture capital supports pro-social start-ups and social entrepreneurs for the greater goal of increasing the social impact of financial markets.

As of today, social responsibility has emerged into an *en vogue* topic for corporate executives, governmental officials, international public servants, and stakeholder representatives. Due to globalization, worldwide business mergers, but also as for international deficiencies beyond the scope of nation states; the call for CSR and SRI has reached unprecedented momentum. In the wake of the 2008 financial crisis, corporate social misconduct and financial fraud have steered consumers and investors to increasingly pay attention to democracy and social responsibility within market systems. Current stakeholder pressure addresses social responsibility of market actors and information disclosure of corporate and financial conduct. Legislative reforms enhance the accountability of financial market operations. With the era of liberalization being halted by the 2008 financial crisis, the reinterpretation of the public-private sector roles in providing social services has leveraged social responsibility into a pressing topic of debate. The renaissance of attention to responsibility as a prerequisite for the functioning of economic systems portrays CSR and SRI as windows of opportunity to re-establish trust in fallible market systems.

SRI is a multi-stakeholder phenomenon that comprises economic, organizational, and societal actors. SRI stakeholders represent the financial and public sectors as well as academia and media. Primary SRI constituents are banking executives, fiduciaries, institutional and private investors, governmental and nongovernmental representatives, labor union members, officials of international organizations, as well as academics and media correspondents. To overcome socioeconomic losses implied by the various stakeholders' SRI notions, stakeholder dialogues integrate multiple parties to align differing viewpoints and priorities in common goals.

## Socially Responsible Investments

In recent decades, SRI experienced a qualitative and quantitative growth in the Western World that can be traced back to a combination of historical incidents, legislative compulsion, and stakeholder pressure. Due to a qualitative and quantitative growth in the Western World within recent decades, SRI emerged into an investment philosophy adopted by a growing proportion of financial practitioners. Key indicators for the ascent of SRI are the increasing number and diversity of SRI options. Over the past decades, SRI has grown 4% faster than all professionally managed investment assets. In the aftermath of the world financial crisis and the subsequent age of austerity, social responsibility has evolved into an *en vogue* topic for the corporate world and the finance sector. Contrary to classic finance theory that sees investments as primarily based on expected utility and volatility, the consideration of social responsibility in financial investment decisions has gained unprecedented momentum.

The rise in SRI is accompanied by the upcoming of stock exchange rating agencies, social responsibility impact measurement tools, social reporting, and certifications. Today the range of shareholder engagement possibilities is more sophisticated than ever and trends forecast a further maturation of SRI from a niche segment solution into a mainstream market feature.

SRI can be traced back to ethical investing of religious institutions and societal attention to social, environmental, and political deficiencies. In the 1960s, shareholder activism of civil rights campaigns and social justice movements drove SRI. Since the 1980s, positive screenings identified corporations with respective CSR policies and political divestiture became prominent in the case of South Africa's Apartheid regime. Environmental catastrophes in Chernobyl and Bhopal as well as the Exxon Valdez oil spill triggered environmentally conscientious investment. SRI was propelled in the wake of the micro-finance and cooperative banking revolution.

Political activism finds expression in financial markets by political divestiture, which refers to the removal of stocks from socially irresponsible markets with the greater goal of accomplishing social and political changes. In the wake of historical and political events, stakeholder pressure can trigger shareholders to divest from politically incorrect markets with the goal of accomplishing sociopolitical change. A prominent case for political divestiture is the capital flight from South Africa during the Apartheid regime featuring racial segregation policies connected to economic discrimination against non-European South African groups. Anti-Apartheid activism began in 1965 and led to guided divestiture of US corporations since 1978. The enactment of the US Comprehensive Anti-Apartheid Act in 1986 backed up political divestiture from South Africa. During Apartheid, international sociopolitical pressure and foreign investment flight was accompanied by cultural restrictions and UN international trade sanctions. By 1990, South African President de Klerk began dismantling the Apartheid system accompanied with an Apartheid reform process. As of today, political sanctions are imposed on the Sudanese government in response to related terrorist activities and the humanitarian crisis in Darfur. The Sudanese Divestment Task Force publicly outlines Sudan's dependence on foreign direct investment and the governmental vulnerability to political divestiture. Based on six studies of political divestiture from Apartheid South Africa that were meta-synthesized, the relation of stakeholder pressure, political divestiture, and corporate endeavors suggests a positive but also a negative impact, and even no relation of political divestiture and corporate value was reported (Puaschunder 2015). The instringent findings are attributed to methodological difficulties and aid in drawing inferences on the transition into renewable energies and implementation of climate stability bonds.

SRI is a context and culture-dependent phenomenon featuring international differences. North America, Europe, and Australia account for the most vital SRI markets. In the USA, SRI is mainly promoted by independent organizations and regulatory institutions that use proxy statement disclosure to rate corporations on their social and environmental performances and impacts. Based on the US model, since 2006 the Canadian Securities Administrators have mandated mutual funds to publicly disclose their proxy voting. In Europe, SRI booms in Northern and Central European countries, yet is relatively slow to take off in Southern Europe. Within the European Union, institutionalized and governmentally administered SRI rose in recent decades. In the UK, SRI was perpetuated by governmental legislations encouraging shareholder votings and formal consultations with funds' holders on the adoption of social, ethical, and environmental policies. Similar regulations are currently considered by the European Parliament and have been passed in Australia, Germany, and Sweden. In German-speaking countries, SRI propelled during the 1970s green wave. The 2002 Australian Financial Service Reform Act introduced social responsibility disclosure statements for financial services followed by the Australian Securities and Investment Commission issuing SRI disclosure guidelines. Emerging SRI markets are Latin America, South Africa, and Japan with prospective extensions to Taiwan, Singapore, and Hong Kong. Brazil, South Africa, and Asia exhibit a special attention to microfinance and community investing.

The UN plays a pivotal role in institutionally promoting SRI in guidelining principles and PPP initiatives. In 2004, the UN invited a group of leading financial institutions to form a financial responsibility initiative under the wing of the UNGC. In 2006, a UNGC division launched "The Principles for Responsible Investment" in collaboration with the NYSE. The Principles for Responsible Investment (PRI) were launched as part of the UNGC to encourage institutional investors to embrace SRI. This initiative develops guidelines and recommendations on how to integrate environmental, social, and corporate governance in financial markets and how financial investment banks and fiduciaries can implement social responsibility goals as a risk management tool. In February 2008, the UN Conference on Trade and Development (UNCTAD) launched the "Responsible Investment in Emerging Markets" initiative, which enhances transparency of emerging financial markets. In the wake of the 2008 financial crisis, SRI is attributed the potential to reestablish trust in financial markets. Stakeholder pressure and changing financial market regulations enhancing accountability and transparency are believed to perpetuate SRI in the future.

SRI is introduced to stem from sociopsychological motives of investors that supplement profit maximization goals. As classic finance theory has blacked out moral and ethical dimensions of investment decision-making, the knowledge on socioeconomic facets of SRI behavior is limited. Exploratory analyses of demographic and financial SRI correlates are currently complemented by research on sociopsychological SRI motives. A framework of SRI motives is proposed comprising – apart from profitability calculus – sociopsychological motivating factors such as altruism, innovation and entrepreneurship, strategic leadership advantages, information disclosure, self-enhancement, and expression of social values of socially responsible investors, who tend to have a long-term focus. Contemporary academic literature promotes SRI and explores sociopsychological motives of ethical investment in expert interviews, questionnaire surveys, and experiments. In the political sciences literature, SRI was introduced as a soft-law shareholder activism approach that differs throughout the world.

One of the newest developments is carbon divestiture in the wake of climate stabilization efforts. The maintenance of a favorable climate accounts for the most challenging contemporary global governance predicament that seems to pit today's generation against future world inhabitants in a trade-off of economic growth versus sustainability. Innovative intertemporal fiscal policy approaches (e.g., of Jeffrey Sachs) propose an economically efficient and intergenerationally fair allocation of efforts towards mitigation and adaptation by climate stabilization bonds.

Fossil fuel divestment aims to reduce carbon emissions by accelerating the adoption of renewable energy through the stigmatization of fossil fuel companies. This includes putting public pressure on companies that are currently involved in fossil fuel extraction to invest in renewable energy. Competition from renewable energy sources may lead to the loss of value of fossil fuel companies due to their inability to compete commercially with the renewable energy sources. In some cases, this has already happened. Unstable fossil fuel prices have made investment in fossil fuel extraction a more risky investment opportunity. West Texas Intermediate crude oil fell in value from $107 per barrel in June 2014 to $50 per barrel in January 2015. Goldman Sachs stated in January 2015 that, if oil were to stabilize at $70 per barrel, $1 trillion of planned oilfield investments would not be profitable. The stigmatization of fossil fuel companies caused by divestment can materially increase the uncertainty surrounding the future cash flows of fossil-fuel companies.

From half a dozen college campuses in 2011, calling on their administrations to divest endowments from coal and other fossil fuels and invest in clean energy and "just transition" strategies to empower those most impacted by environmental degradation and climate change, the campaign had spread to an estimated 50 campuses in spring 2012. By September 2014, 181 institutions and 656 individuals had committed to divest over $50 billion. One year later, by September 2015, the numbers had grown to 436 institutions and 2040 individuals across 43 countries, representing $2.6 trillion in assets, of which 56% were based on the commitment of pension funds and 37% of private

companies. By April 2016, already 515 institutions had joined the pledge. 27% faith-based groups, 24% foundations, 13% governmental organizations, 13% pension funds, and 12% colleges, universities, and schools, representing, together with the individual investors, a total of $3.4 trillion in assets.

The divestment campaign at the Australian National University is one of the longest running in the world and, while it has not yet achieved full fossil fuel divestment, it has had substantial wins, most notably in 2011 and 2014. Students lobbying and public pressure led the ANU Council to implement a Socially Responsible Investment Policy in late 2013 modelled on Stanford University, which aims to "avoid investment opportunities considered to be likely to cause substantial social injury."

As another novel alternative, climate stabilization funds aim at financing climate mitigation and adaptation around the world through an intertemporal fiscal policy mix backed by climate bonds and carbon tax. Bonds are debt investment, in which investors loan money to an entity, which borrows the funds for a defined period of time at a variable or fixed interest rate. Bonds are primarily used by companies, municipalities, states, and sovereign governments to raise money and finance for a variety of future-oriented long-term projects and activities. This solution appears as real-world relevant means to tap into the worldwide USD 80 trillion bond markets in order to fund the incentives to a transition to a sustainable path. Carbon tax will also be introduced. Sharing the costs of climate change aversion between and across generations appears as important strategy to instigate immediate climate change mitigation through incentivizing emission reduction and provide adaptation flexibility (Puaschunder 2016a). Overall, this turns climate change burden sharing into a Pareto improving option over time (Puaschunder 2016b).

In order to avoid governmental expenditure on climate change hindering economic growth (Barro 1990), Sachs (2014) introduces financing climate change mitigation through debt to be paid back by future generations through taxation as a novel means to amend individual saving preferences in favor of future generations (Marron and Morris 2016). Carbon taxes can raise substantial revenue until the economy is largely decarbonized (Marron and Morris 2016). In Sachs (2014) 2-period model, one generation works in period 1 and retires in period 2. Part of the disposable wage income is saved for consumption in the second period. $CO_2$ emission mitigation imposes immediate costs onto current generations and reduces wages. Greenhouse gas concentrations in period 2 are determined by the emissions in period 1. Wages of the young in the second period are reduced by climate change dependent on greenhouse gas levels. Disposable labor income of the young equals market wage net of taxes. Sachs (2014) proposes to mitigate climate change by debt to be repaid by tax revenues on labor income in the future. Leaving the current generation with unchanged disposable income allocates the burdens of climate change mitigation across generations without the need to trade off one generation's well-being for another's. While today's young generation is left unharmed, the second period young generation is made better off ecologically. Taxes on later generations are justified as for the assumed willingness of future generations to avoid higher costs of climate change prevention and environmental irreversible lock-ins. Overall this tax-and-transfer mitigation policy is thus pareto improving across generations. All generations are better off with mitigation through climate bonds as compared to the business-as-usual (BAU) non-mitigation scenario (Sachs 2014). While future generations enjoy a favorable climate and averted environmental lock-ins, the current populace does not face drawbacks on economic growth.

## Synonyms

Social science research on NPOs

## Definition

Sociological study of NPOs refers to scientific research on NPOs, in all its ramifications, with some particular sociobehavioral science perspective, such as sociology or political science, or an interdisciplinary or social profession perspective, such as management or public administration. See also NPO definitions entry.

## Introduction

The sociological study of NPOs is a historically recent phenomenon, as is to be expected, since sociology is a social science that originated only in the nineteenth century. By contrast, history as a scholarly enterprise and discipline has roots that go back millennia. Historians have been interested marginally in NPOs, especially associations, for probably 4500–5000 years, or since the origins of writing. In the fledgling discipline of sociology, various of the discipline's founders wrote about NPOs as specific types, without using this technical term. For instance, Max Weber, one of the founders, wrote about the sociological study of associations in 1910. He later wrote a book about the sociology of religion (1922), which included a discussion of churches, which are usually NPOs, though he did not use the latter term.

In fact, the entire concept of the voluntary nonprofit sector (abbreviated as *VNPS*) did not originate until 1965, when Richard C. Cornuelle was the first to write (a book) about a *third sector* or *independent sector*. The term *nonprofit sector* and also the term *nonprofit organizations* or *NPOs*, and their synonyms did not come into common use until the 1970s (Smith 2016). But the actuality, the existence of the VNPS and NPOs goes back at least 10 millennia, to about 8000 BC (Smith 1997). The first type of NPOs, and the most common type today all over the world, was voluntary associations, which originated when some humans first became residential horticulturalists (gardeners), rather than the nomadic hunting-gathering bands. These tiny (30–70 people) preliterate tribes were the usual human societies for the first 190,000 years of our species' existence. This horticultural revolution was the first of four global associational revolutions in our history as a species, all of them based on major economic system shifts. Nonprofit agencies and foundations as NPO structural forms

originated thousands of years later: agencies in the first millennium BC, and foundations two millennia later.

This chapter describes major books on NPOs; three key types of NPOs; the global history of NPOs; global numbers of NPOs; major characteristics of associations, nonprofit agencies, and foundations; and the dark side of NPOs.

## Sociological and Interdisciplinary Study of NPOs

Although there has been minor sociological study of NPOs, especially associations, since the 1920s, the organized global field of NPO, VNPS, or voluntary action research began in 1971, with the founding of ARNOVA (the Association for Research on Nonprofit Organizations and Voluntary Action; www.arnova.org), the first interdisciplinary association in this field (Smith 2016). This global field and emergent academic discipline can be referred to generally as voluntaristics (Smith 2016). Initially a sociology-dominated enterprise, ARNOVA has become the model for over 50 subsequent interdisciplinary associations on all continents and at various levels of territorial scope, from local to global and about 70 interdisciplinary voluntaristics journals (Smith 2016).

Beginning in 1975, chapters on NPOs and related phenomena (NPOs, voluntary action, volunteering, associations, nonprofit agencies, social movements) began to be published irregularly in the prestigious *Annual Review of Sociology* (Smith 2016). Top sociology academic journals also began to publish articles more frequently on NPOs, especially on associations and volunteering, but also on social movements and protest activities. In the past three decades, there has been an increasing number of social science handbooks dealing with NPOs and the VNPS, the first one being by Powell, with a second edition by Powell and Steinberg 19 years later (2006). Edwards (2013) edited a handbook on global civil society, another name for the VNPS. The handbook edited by Cnaan and Milofsky (2008) focused on community movements and local associations. The most extensive social science (but largely sociological) handbook, edited by Smith et al. (2016), is a two-volume compendium of 54 literature review chapters (over 1400 pages) on volunteering, citizen participation, and nonprofit associations. A few handbooks focus on philanthropy and foundations (e.g., Jung et al. 2016). Anheier et al. (2010) edited an important *International Encyclopedia of Civil Society*. There have also been some major authored (vs edited) books reviewing the research literature on NPOs and VNPS phenomena, including volunteering.

In the last 20 years or so over 60 core social science, often sociological, journals have begun publication focused centrally on NPOs or other VNPS phenomena (Smith 2016), taking ARNOVA's SSCI-listed academic journal, *Nonprofit and Voluntary Sector Quarterly (NVSQ)* as a founding model. Thomson-Reuters now has seven such journals in its Social Science Citation index (SSCI), which includes the 3200+ highest quality journals in all fields and disciplines of sociobehavioral science, out of many tens of thousands in total being published. An online search by the author and a colleague using about 80 keywords related to the VNPS on all of the SSCI journals at the website of the Web of Science showed identified about 120,000 articles in this field in thousands of journals. Several research studies have shown that various aspects of voluntaristics have been growing exponentially since about 1995 – journals, articles, dissertations, associations, research centers, college courses, etc. (Smith 2016). An estimated 40,000–50,000 sociobehavioral science academics and researchers worldwide now contribute to voluntaristics via conference papers, articles, book chapters, and books. At least 20,000 of these are members of voluntaristics researcher associations or relevant sections of national and international disciplinary or professional associations (Smith 2016).

## Defining Key NPO Types

As noted above, there are three main structural types or forms of NPOs, which will now be defined and discussed briefly.

### Associations

The most common type of NPO numerically in nearly every society ever studied carefully is the *association*, often called a *voluntary association* (but also sometimes termed a *common interest association, membership association, community association, micro-association*, or *nonprofit association*). According to the most extensive dictionary in the field of voluntaristics (Smith et al. 2006, p. 23), an association is "a relatively formally structured nonprofit group that depends mainly on volunteer members for participation and activity, and that primarily seeks member benefits, even if it may also seek some public benefits." Associations nearly all use some variation of the associational form of organization, defined in that dictionary (p. 24) as a: "manner of operating a group that usually involves having official members who are mostly [or all] volunteers, some elected formal nonprofit leaders, often a board of directors with policy control, financial support mainly from annual dues and/or donations (but may also include fees and grants), often one or more committees as part of the leadership, and regular face-to-face meetings attended by official members and informal participants." In associations, the ultimate power nearly always resides in the membership, which in most cases, votes annually (or every 2, 3, or 4 years) on the official leaders, usually both officers and board members. However, in authoritarian societies, association leaders may dominate, with the preferences of the members not significant, as in nonprofit agencies.

### Nonprofit Agencies

The main voluntaristics dictionary (Smith et al. 2006, p. 155) defines a nonprofit agency as a, "nonprofit organization providing a public benefit. Such agencies usually operate with paid staff, though some are small, volunteer-run nonprofit groups. Generally speaking, then, the nonprofit agency relies on [paid] staff to accomplish its goals rather than members or service program volunteers." Further, nonprofit agencies, often termed *voluntary agencies* (or *volags*), differ markedly from associations in their power structure and orientation toward beneficiaries. Where associations are bottom-up, democratic in their power structures, nonprofit agencies are nearly always top-down, with ultimate power residing in a board of directors or top staff, authoritarian in their power structures, like businesses and government agencies, and hence not democratic at all. That both associations and agencies are called NPOs is thus misleading, because of this fundamental difference in their power structures.

Smith (1991) has argued that there are two distinct but related nonprofit sectors or subsectors – the association subsector and the agency subsector. Unfortunately, many voluntaristics scholars think only of nonprofit agencies when they think about or do research on NPOs, neglecting associations. This is a serious theoretical/conceptual error. Smith (2000, Chap. 10) referred to this as a *flat-earth map* or paradigm of the VNPS, analogous to Europeans thinking Europe was the whole of the earth 500 years ago and earlier. Where most associations are supported financially by annual *dues* (routine payments required of official members), voluntary donations by members, and fundraising events which involve the members' families and the general public, agencies are mainly supported by fees for services or entry fees from recipients of their services, partly by donations (including bequests from the deceased), and to a lesser extent partly by grants from foundations or contracts with government agencies.

Nonprofit agencies also differ markedly in their targets of benefits, as noted in the brief definition above – who they are trying to help or affect: Where associations nearly always have a central focus on *benefitting their members*, because their members are mainly volunteers and do all the work, agencies in general are centrally focused on *benefitting nonmembers*, either the public in contact or the general public interest, sometimes including the environment or ecosystem. Further, agencies generally operate with *paid staff*, who do most of the work and hold nearly all of the power. Often there is also a volunteer (service) program, as the volunteer department of the agency. But such program volunteers are lower participants, usually doing unskilled or semiskilled tasks, useful but not necessary to the

agency's goal attainment; they have a little or no power over policy or operational decisions.

### Foundations

Foundations are a special type of nonprofit agency, defined as follows (Smith et al. 2006, pp. 89–90): "nonprofit group usually having a substantial endowment and, in the United States [and elsewhere] a special tax status as a [tax-exempt] private foundation which makes philanthropic (as philanthropy) grants to individuals or nonprofits or both." Most foundations are independent, nonoperating NPOs, usually termed *private foundations*, whose central activity is making grants of money to other charities or NPOs, rarely to individuals. *Operating foundations* are rare and involve NPOs named and registered as foundations that function or operate like other NPOs, spending their funds to accomplish various philanthropic goals. They differ from most NPOs in depending mainly or wholly on their endowments for money, rarely charging fees or getting grants or contracts from external organizations.

## Global History of NPOs

The best global history of associations is found in Smith et al. (2016, Chap. 1).

As noted earlier, the earliest NPOs, circa 8000 BC, were small associations in preliterate societies that had settled down to be residential gardeners (horticulturalist) and raise a few types of domestic animals, rather than being roving, nomadic tribes hunting, fishing, and gathering food that grew wild (Smith 1997). These settled horticultural societies were essentially small villages (up to 1500 people), but they were *much* larger than the 30–70 people who constituted hunting-gathering nomadic bands as preliterate societies for nearly 200,000 years earlier.

This first global associational revolution was followed by three more such revolutions. The second global associational revolution occurred about 3000 BC and thereafter, because more efficient and productive agriculture was invented, termed the agrarian revolution (i.e., fertilizer, irrigation, weed control, deep plowing), that could now support towns, and eventually cities (Smith 1997). In these urban places, many new types of associations arose, especially guilds as associations of tradesmen and artisans in a wide variety of urban occupations. The third global associational revolution accompanied the Industrial Revolution in industrial societies, about 1800 AD and thereafter (Smith 1997). Factory jobs required significant education, so mass education supported by governments was instituted. Mass media also arose, as did better transportation systems, to serve large industries and national and state or provincial governments. Democracies often replaced divine right monarchies and empires. These economic and social structural changes fostered a wide variety of new types of associations, including associations for leisure and recreation, trade unions, professional and occupational associations, new types of religious associations, scientific societies, political clubs and parties, social movement organizations, and eventually self-help groups like Alcoholics Anonymous. The fourth global associational revolution, the service-technology revolution, began about 1950, as certain nations became post-industrial, service-information-technology societies. New technologies like the computer, mobile phones, and the Internet spurred personal intercommunication and facilitated the growth of associations, especially national and international associations, but also local associations.

There is as yet no book that provides an extensive global history of nonprofit agencies, but a brief version can be found in Smith (2015b) and Chaps. 1 and 2 of Powell and Steinberg (2006) give more extensive treatments of some agency types. The earliest known nonprofit agencies arose in the last 500 years BC, such as Plato's Academy in Athens as a protocollege (c. 387 BC), the Temple of Aesclepius at Epidauris in Greece as an early hospital (c. 430 BC), and the Ennigaldi-Nanna's protomuseum in Ur or ancient Iraq (c. 530 BC). There were other examples of various kinds of nonprofit agencies in most of the next two millennia, but such agencies were generally rare, especially when their prevalence is compared to the frequent, often abundant, prevalence of associations of many types. Smith

(2015b, p. 262) states, "The vast majority of current Volags [nonprofit agencies] have been founded in the past century or two."

## Global Numbers and Prevalence of NPOs

It is extremely difficult to estimate accurately the global numbers of NPOs, given poor prevalence data in nearly all contemporary nations. Nonetheless, Smith has attempted a rough approximation: He estimates that there were about 56 million NPOs circa 2010–2013, with roughly 87.5% (49 million) of these being local or grassroots associations. The remaining 12.5% (7 million) are mainly nonprofit agencies and foundations, with a small percentage of paid-staff based national or international associations. These figures are probably of the right order of magnitude, but not really accurate except to plus or minus 30%. Still, this is better than no estimate at all, or an expected error or 300% or 3000% (see also Powell and Steinberg 2006, Chap. 5).

Research is considerably more convincing regarding the broader determinants of *association prevalence* in the nations of the world (Smith et al. 2016, Chap. 50). Association prevalence is usually expressed not as an absolute number, but rather relative to the population of a nation (or other territory). Two independent studies with about 90–140 of the larger nations of the world (out of about 200 total nations) have explained with high accuracy (70–89% of the variance) that in addition to sheer population size, a nation's association prevalence is determined by such factors as its GDP per capita, its average educational level, its extent of democracy and civil liberties, the length of its experience with democracy, lack of civil disorders and civil wars, higher government expenditures per capita, and other factors (Smith et al. 2016, Chap. 50).

## Voluntary Association Characteristics

Based on extensive reviews of the literature (e.g., Smith 2000, 2015a; Smith et al. 2016) with data from many nations, we know many facts about associations in the contemporary world. For instance, the vast majority of associations are local, not national or international. But national associations (and, to a lesser extent, international associations) have been growing rapidly in recent decades, as part of the fourth global associational revolution and the related processes of modernization and globalization. Most local or grassroots associations are all volunteer-based in their operations. Paid staff, if present, are small in numbers. This means there are at least a billion associational volunteers in the world. Based on research in 50 nations (Smith et al. 2016, Chap. 3), the most frequent purposive-activity types of associations are oriented toward religion-ideology-morality (12%) or health-education-social welfare (11%). Next most frequent are associations oriented toward sports-recreation-exercise (8%) or arts-music-culture-study (7%). Local associations are rarely incorporated or registered with the government, but are rather informal in structure and operations, often lacking a board of directors. As a result, local association lifespans are only several years on average and the average size is only about 20–25 members.

Some other generalizations from extensive research on associations include the following (Smith 2015a):

- Except in totalitarian dictatorships, local associations tend to have relative freedom of operation and policy-decision-making, but there is more government control at state or province and national association levels, especially in authoritarian nations.
- The large majority of associations at all geographic levels are conventional and law-abiding, with fundamentally deviant, usually secret or underground, associations being very rare, probably less than 1% or even 0.1% of all associations.
- In modern, industrial and postindustrial, service-information societies, a substantial percentage of local associations are polymorphic, meaning they are branches of some state or province association or national association.
- Most associations, especially local associations, practice internal democracy by routinely

having members vote on the leaders, but oligarchy as continuing leadership by a small clique, often results de facto, as the core of most active members tend to be in charge over years, whether formal or informal leaders.
- Frequent, direct, face-to-face interpersonal contact at meetings and other events, and between meetings; create friendships among members; and provide emotional rewards, especially in local associations.
- Association members often also enjoy rewards from working for an association's goals, a kind of felt psychic benefit from working toward and at times achieving the official goals of the group.
- Economic benefits are usually unimportant in associations, especially local associations, which are basically leisure activities; but economic associations, like farmers' associations, unions, professional associations, trade or business associations, are exceptions, where longer-term economic benefits play a substantial role for members.
- Associations usually have restrictive eligibility criteria for membership, but in most communities, there is a range of local associations that can accommodate most kinds of people, and new associations are easy to form by people who feel left out of existing associations.
- Most local associations have relatively low prestige and power, but there are always some local associations that have high prestige or power, usually with local elites as members.
- State or province and especially national associations tend to have more prestige and power on average, but meet much less frequently and have weaker emotional relationships among members, usually emphasizing instrumental task accomplishments.
- Local associations can have a variety of significant impacts on their members and volunteers, such as greater longevity, better health, more life satisfaction and positive sense of wellbeing, more felt political efficacy, and even improved economic status.
- Online involvement in cyber-associations tends to be very weak and shallow, lacking personal, face-to-face interactions with other members, and has not been shown to have impacts similar to in-person involvement in local associations.
- Associations, especially national and international associations, have had a far greater impact on human history and societal progress or ethical evolution than nonprofit agencies, which mainly implement sociocultural changes brought about by associations and social movements (Smith 2017).
- Associations have the continuing potential to accomplish nearly any goal of human beings, and this versatility makes the associational form of organization uniquely valuable to all human societies.

## Nonprofit Agency Characteristics

Based on extensive reviews of the multinational literature (e.g., Edwards 2013; Powell and Steinberg 2006), much is known about contemporary nonprofit agencies. For instance, the vast majority of such agencies are local in territorial scope, rarely state or province-wide, national, or international; the latter are more likely to be government agencies. Nonprofit agencies on average tend to have more assets and annual income than associations, constituting from 2% to 10% of the GDP in most nations, with the higher percentages in more developed, postindustrial nations (Salamon et al. 2004). Agencies are usually more businesslike and bureaucratic than the average association. Most agencies have owned or rented office space, and operate during working hours on weekdays, often weekends as well. Some critics argue that nonprofit agencies are for-profits in disguise, taking unfair advantage of their tax-exempt status. In the case of hospitals especially, this criticism seems to have significant merit. The attitude or emotional spirit of philanthropy is more clearly present in the members or leaders of all-volunteer associations than among the paid staff and executives of nonprofit agencies.

Nonprofit agencies compete with government service agencies in most nations, but the last few decades have seen an increasing trend for

national, and even lower level, governments to contract with nonprofit agencies to deliver services to the general public (Powell and Steinberg 2006, Chap. 10). Nonprofit agencies are found most frequently delivering services in the fields of health, education (especially higher education), and social welfare (ibid., Chaps. 16, 17, and 19). There are also many religious and political advocacy nonprofit agencies in various nations (ibid., Chaps. 13 and 20). The management or governance of larger nonprofit agencies is usually highly centralized, bureaucratic, and professional, with top executives increasingly having masters or even doctoral degrees from business or public administration university graduate schools.

Nonprofit agency leadership and governance generally contrast markedly with the looser, less bureaucratic, nonprofessional leadership in most associations, especially local ones (Smith et al. 2016, Chap. 36). Only very large, usually national or international, associations have similar professional management. Smaller associations often suffer serious damage to their missions and volunteer commitment when well-meaning but misguided new leaders try to make the association more *businesslike*. Members and active volunteers in associations are usually involved in leisure time activities, serious leisure, that should be enjoyable and self-enhancing, not businesslike or work-like.

Evaluating the impacts of nonprofit agencies is difficult, complicated, and expensive to do well. There is little doubt that nonprofit agencies such as hospitals, colleges, universities, and museums, and the like usually have positive overall impacts on their customers, but not *all* impacts are positive. For instance, nonprofit hospitals are semidangerous places for patients, just as any other kind of hospital, because of iatrogenic disorders and diseases. In marked contrast with associations, there is no consistent and convincing evidence that nonprofit agencies have positive impacts on their paid staff affiliates, and many volunteers at times are mistreated by paid staff. As noted earlier, nonprofit agencies mainly do apparently useful things, but generally represent the *status quo*. Virtually without exception, ethical evolution and societal progress in human societies everywhere has been triggered and achieved by associations, especially social movements and their constituent associations, and their mobilization of informal protest participants (Smith 2017; Smith et al. 2016, Chap. 24).

## Foundation Characteristics

Based on extensive multinational reviews of the literature (e.g., Jung et al. 2016), much is also known about private foundations, which historically have been called *trusts*. As noted earlier, foundations are the least common major type of NPO, because by definition they involve substantial amounts of money as philanthropic gifts to create an endowment. The significant numbers (but rarely more than 5–10% of total registered NPOs) of foundations in the United States and other postindustrial nations reflect changes in tax laws in these countries in the past decades or century that give substantial tax deductions to the donors of foundation endowments/assets. Critics of this NPO structural form argue that the principal motivation of such donors is reducing (or, to be pejorative, evading) taxes on income. Fragmentary and anecdotal evidence supports this view, but it is difficult to get foundation donors to be honest about their motivations (Jung et al. 2016, Chap. 17).

Although most people think of the huge, multinational foundations like Ford or Gates when they consider foundations as a category, these giants are very atypical, just as the AARP (formerly, the American Association of Retired Persons) is atypical of associations and Harvard University is atypical of nonprofit agencies in the United States. Globally, the most frequent subtype of foundations is a small family foundation, controlled by the initial donor and his or her family and friends. Such foundations typically give relatively small grants to the donor's favorite charities, which tend to be religious NPOs, nonprofit schools and colleges or universities, high culture musical and artistic NPOs (e.g., symphony orchestras, ballet companies, opera companies), and the like. Founding donors often receive public recognition in perpetuity by the recipient NPO for

larger gifts (e.g., names in event programs, names on the wall in the NPO building, buildings named after the donor).

Careful evaluation of the functioning and impact of foundations in any nation, let alone comparative multinational evaluation studies with quantitative approaches, are rare or nonexistent (Jung et al. 2016). At the superficial level of outputs, foundations are almost always successful in giving away money to charities, but the impact of such grants is unclear. Larger nonprofit agencies are often substantially dependent on foundation grants to function and seek their official goals. The recipient NPOs, usually tax-exempt charities of some kind, are always grateful and have no difficulty spending the money for operations or special projects. But the latter expenditures are rarely, if ever, evaluated carefully regarding their positive or negative impacts, as noted briefly earlier (Jung et al. 2016, Chap. 17).

The general conclusion must be that in most nations, perhaps all, that have been carefully studied, very little of the foundation funding has been shown to benefit anyone but elites and the *status quo*. A careful qualitative evaluation of foundation giving in the United States a couple of decades ago showed very little such funding benefits the poor, the disadvantaged, or the minorities in a nation. That study and others have shown clearly that very little foundation funding goes to NPOs that do advocacy for social change. The large majority of foundation funding goes to nonprofit agencies supporting elite NPOs and the status quo. Very little (1–2%) goes to associations, let alone to associations that seek ethical evolution and social change. This should surprise no one, given the elite type of people who control most foundations.

## The Dark Side of NPOs

Although infrequently and inadequately studied by voluntaristics scholars anywhere, dysfunctions, misconduct, tolerable deviance, and even crime by NPOs has been rarely studied. Chapter 17 by Smith et al. in the handbook by Jung et al. (2016) describes and discusses many examples of the *darker side of philanthropy*, including foundations, but also nonprofit agencies and associations. Chapter 53 by Eng et al. in the Smith et al. (2016) handbook goes into more detail about the dark side of associations.

## Conclusion

Within the category of nonprofit organizations/NPOs, there are three principal subtypes: voluntary associations, nonprofit agencies, and foundations. Associations are by far the oldest subtype, arising in many societies about 10,000 years ago. Associations are also the most prevalent in all human societies ever studied carefully. Although nonprofit agencies and foundations perform useful functions in societies where they exist, associations, especially those involved in social movements, have the greatest long-term impact on ethical evolution and social progress in human history.

### Introduction

Governance is concerned with the ways of governing organizations and societies. It includes governments, businesses, and international organizations, among others. A prominent scholar Abercrombie and co-authors (2006) stated that "Governance refers to the administrative structure of the state, that pattern of self government of individuals and the regulatory principles of modern society". Political analysts Kuper and Kuper (2005) said "Governance refers to the process of political management which embraces the normative basis of political authority, the style in which public affairs are conducted and the management of public resources". Professor Goran Hyden (2014) brought greater clarity to the concept of governance. He elevated governance to an "umbrella concept to define an approach to comparative politics,", an approach that fills analytical gaps left by others. Using a governance approach, he emphasized: "the creative potential of politics, especially with the ability of leaders to rise above the existing structure of the ordinary, to change the rules of the game and to inspire others to partake in efforts to move society forward in new and productive directions". His view is that governance involves creative intervention by political actors who change structures that inhibit the expression of human potential. He sees governance as a rational concept, emphasizing the nature of interactions between state and social actors, and among social actors themselves. In sociology, other scholars highlighted how society is governed. Governance according to Functionalist Arnold Rose, Peter Bentley, Talcott Parsons and Neil Smelser emphasized equilibrium, and stated that stability and gradual change were the key factors in governing society. They believe that societal power is decentralized, widely shared, diffuse, and fragmented, and derives from many sources, i.e., the power pie is divided into many pieces. Society is made up of a multitude of conflicting interest groups balanced by the state. Groups can potentially be equally influential in their impact on government policy and major institutions, assuming that there is a natural balance of power among various groups, preserved through bargaining and compromise (win some and lose some, give and take); in this

way equilibrium is reached in group struggle. The outcome is shared acceptance of a basic political framework, i.e., consensus about values, democratic traditions, procedures and principles (George Kourvetaris, Allyn & Bacon: Needham Heights, MA, 1997). Elite theory, Seymour Martin Lipset's work, Robert *Dahl's* polyarchy, Michel's iron law of oligarchy, Pareto's psychological and irrational aspects of elites, and W. Domhoff's governing class model all highlight societal power as being in control of key societal institutions such as corporations and executive branches of government, i.e., the economy, the state, and the military. In Marxism, society is ruled by those who control the means of production – the economic system. In structuralism, the structural imperatives of the capitalist system as they affect the state and its relative autonomy emphasize ideological factors. They focus on structural constraints in the capitalist system that set limits on the state's autonomy, and force it to work within the framework of an order that yields results invariably favorable to the dominant capitalist class. (Kate Nash, Blackwell Publishers: Malden, Massachusetts, 2000). Indeed, governance involves interaction between formal institutions and those in civil society. Governance refers to a process whereby elements in society wield power, authority, and influence, and enact politics and decisions concerning public life and social upliftment. Sociology and governance are intertwined and constitute a useful mechanism to enhance the legitimacy of the public realm or community or organization or of a nation. In this regard, Gumplowicz emphasized that "We live in the state and in society; we belong to a social circle which jostles against its members and is jostled by them; we feel the social pressure from all sides and we react against it with all our might; we experience a restraint to our free activities and we struggle to remove it; we require the services of other (people) which we cannot do without; we pursue our own interests and struggle for the interests of other social groups, which are also our interests. In short, we move in a world which we do not control, but which controls us, which is not directed toward us and adapted to us, but toward which we must direct and adapt ourselves".

## Conceptions of Interaction Between Sociology and Governance

From the formulations of Karl Marx has come the pervasive view that class conflict and social stratification derive from economic factors or from the social relations generated by the mode of production. But Marx's fundamental contribution is not limited to or even dependent upon the orientation that political behavior is an expression of economic interests. To the contrary, his essential contribution was that he made the study of sociology of governance equivalent to the study of societal structure, or macro sociology. Marx's view that the governance system derives from the pattern of social stratification, rather than his specific emphasis on the primacy of economic factors in fashioning social relations, has been a dominant theme in the development of an empirical analysis of governance.

Nevertheless, such an orientation has been criticized, both by political scientists and by sociologists, because it reduces governance events to a social by-product, and fails to consider the consequences of differing types of political institutions on societal change. It was from the writings of Weber that sociologists received the intellectual impetus for a more autonomous and institutional view of governance. As a sociologist, Weber adopted a mode of reasoning that converged with that of Marx, in that he held a comprehensive view of social structure as a basis for analyzing governance. However, he saw social stratification as encompassing both economic relations and social status – prestige and honor. Furthermore, in his essay "Class, Status, Party" (1921), Weber postulated that the emergence of modern society involved a historical process of separation of political institutions from economic and social structure. Political institutions thereby emerge as worthy of direct sociological inquiry because they are an independent source of societal change.

These classic formulations of a social stratification view and an institutional view of governance have persisted despite their reformulation in the light of historical events and intellectual criticism. As the division of labor has become more complex, social stratification theories have been reformulated as

"interest group" theories. Governance is still seen as derived from the struggle and conflicts within social strata, but these are viewed as more differentiated and as expressing the demands of specific interest groups – economic, professional, organizational, and even ethnic-religious. Social stratification theories of Governance have been broadened to include the view that the governmental bureaucracy and the political party itself have emerged as new strata, and thereby as elements in the theory of interest groups.

The institutional approach has come to be reformulated as a theory of "societal strain." Political parties are seen as mechanisms for accommodating the strains that exist in modern society. Thus the identification of elements that condition the effectiveness of political organization in performing this mediating function becomes a central topic of sociological inquiry. Because the political party penetrates all sectors of society, and because quasi-political institutions develop to assist the party in this mediating function, the strain theory of sociology of governance must extend widely beyond the internal structure of party organization. The sociologist addresses a range of overlapping empirical problems, whether he begins with a concern for underlying social stratification or with a direct investigation of political party organization.

## Sociological Approaches to Governance

### Rationalist Approaches to Governance

The theoretical foundation of rationalist approaches to governance was laid by economic theories, in particular agency theory, transaction cost theory, and property rights theory. These theories prefer a step-wise approach to modeling economic phenomena. They start with highly simplified assumptions about human nature (e.g., full information of all actors or absence of transaction costs). These assumptions are relaxed only at later stages of model building, if the simple model proves to be insufficient as a baseline model. Agency-theory (Milgrom and Roberts 1992) provides a baseline heuristic for such a parsimonious model of the effects of organizational governance on the commitment and performance of organizational members. According to this perspective, the performance of an individual can be represented as a linear function of the expected reward for carrying out an action, while holding the expected costs of this action constant. From an agency theoretic point of view, informal governance becomes a redundant category. Since rational managers are able to design organizations in such a way that the interests of management and employees are aligned, "informal" governance becomes superfluous. As a consequence, rationalist approaches to governance focus primarily on "formal" governance (for an exception, see Baker et al. 1999). Formal governance is based on rational decisions by management, because the implementation of a formal control structure is usually preceded by cost-benefit calculations. The rationality assumption is also at the core of modeling the effects of formal governance on organizational behavior. Partly triggered by the lack of a rationalist model of informal governance, the parsimonious rationalist baseline model was refined over the years. A number of empirical studies have demonstrated the strong incentive effects of performance-contingent pay (Aghion and Tirole 1997; Baker et al. 1999). All reward theories share the assumption that individuals use the allocation of social approval to influence the behavior of other actors (Flache and Macy 1996). They consider social incentives as one major instrument for exerting social control. The necessary assumption that individuals are interested in social approval from others can be integrated into the core assumptions of egoism and the full rationality of the rationalist approach.

### Culturalist Approaches to Governance

The common denominator of culturalist approaches is the assumption that (material) incentives are insufficient in explaining individual action. They emphasize the "cognitive side" of governance (Stinchcombe 2003): subjective interpretations, symbols, and legitimacy. Culturalist theories of action consider culture – in the sense of shared knowledge and norms – as the major action-generating factor (Sackman 1991; Smircich 1983). Individual interests are closely tied to identities, and not necessarily directed towards the maximization of self-interest. Shared meaning,

group identity, internalized norms, as well as the acceptance and legitimacy of governance practices are seen as the major elements of control. The most influential culturalist approach to governance and its effects is Weberian bureaucracy theory. Its core element is the formal authority of management – a form of power that is considered as legitimate and accepted by subordinates. Formal, bureaucratic, or rational-legal authority is based on the application of formal rules and procedures. Management – the bearer of bureaucratic authority – has to prove its right to assert power by correctly applying the procedures. Formal authority is related to positions, which, in turn, are defined by rights and duties. A functioning bureaucracy, in which the position holders comply with the rules, is superior to other forms of governance. Whereas rationalist approaches define away informal governance, almost the opposite seems to hold for culturalist approaches. Due to the strong emphasis on the importance of norms, cultural meanings and symbolic legitimization, informal and formal governance can hardly be separated, because ultimately all types of governance are culturally mediated. However, from an order of culturalist approach, organizations can be distinguished according to the content of their cultures (e.g., "professional," "bureaucratic," "entrepreneurial," etc.) (Meyer and Rowan 1977; Scott 1995; Powell and DiMaggio 1991) and hegemony theories (Vallas 2003).

### Structuralist Approaches to Governance

Interdependencies and their resulting structures, positions, and power relations play a central role in structuralist theories of governance. Important predecessors of structuralist approaches in governance theories of research are contingency (Mohr 1971; Thompson 1967) and the theory of managerial strategies (Braverman 1974; Reed 1989: 33–49). In the more recent organizational literature, network approaches are receiving special attention (Jansen 2002), with social capital theory (Burt 1992; Coleman 1990; Lin 2001) playing a particularly important role. Contrary to contingency theory and the theory of managerial strategies, proponents of social capital and network theories are increasingly working towards a better microfoundation of their models (Buskens 2002). According to Buskens and Raub (2002), social networks play a role in two respects: As a major element in the process of social control, and as an instrument for processes of learning and the exchange of information. Both rationalist and culturalist micro-foundations assume a positive relationship between the level of reward and the level of effort, with crowding, gift-exchange, and reward models limiting the scope of this general claim to situations in which the actors are not intrinsically motivated: the employer respects solidarity norms, and the interest in social rewards is not stronger than the willingness to sanction free-riders. For structuralist approaches, a more complex picture emerges on the link between reward and effort. Now dense networks can increase the cooperativeness of group members, since the potential loss of social relationships represents a strong sanction for potential free riders (e.g., Barker 1993). Conversely, the exchange of behavioral confirmation in dense networks can also have negative effects for the production of collective goods (Flache 1996, 2002). This is particularly likely if free riders have many strong relationships in the group. Since criticism of uncooperative behavior in such situations is seen as a violation of friendship norms, individuals will often refrain from sanctioning free riders that they consider to be their friends. The aspect of information and learning is central to brokerage models (Burt 1992). As a recent empirical study shows (Burt 2004), organizational members occupying a broker position in the informal network – i.e., they have many contacts to others in the firm who are not linked among each other – are considerably more creative in the production of good new ideas. The reason for their creativity is that persons who are embedded in different social contexts will be confronted with more and diverse opinions, which in turn provides them with the opportunity to synthesize new ideas. Structuralist approaches often equate informal governance with "flat" organizational structures, self-managing teams, and dense informal social networks. Differences in informal governance, therefore, are based on variations in the social and formal structure of organizations. To summarize, there are considerable differences in the way previous research approached the phenomenon of

governance. Whereas the theories pertaining to a particular paradigm share similar assumptions, considerable differences exist between the three paradigms of rationalist, structuralist, and culturalist approaches. Rationalist explanations center on the notion of incentives and rewards, whereas structuralist and culturalist approaches emphasize the importance of legitimacy. Furthermore, each of the three approaches has its own conceptualization of informal governance. This partly explains the conceptual confusion around this issue in the literature, in which informal Governance is equated, respectively, with dense informal networks, strong organizational cultures, peer pressure or subtle strategies of legitimizing control.

## Social Context of Governance

At the empirical level, the bulk of research in the sociology of governance has been directed toward the investigation of the social basis of political cleavage and consensus. These studies are mainly derived from a social stratification theory of politics, and have been characterized by progressive refinement of categories of analysis, from broad concern with class and occupation to much more refined measures of social status. The following dominant factors combine sociology and governance:

### Power/Dominance

In social science and politics, power is the ability to influence or completely control the behavior of people. The term "authority" is often used for power perceived as legitimate by the social structure. Power can often be seen as evil or unjust, but the exercise of power is accepted as endemic to humans as social beings.

Power, according to the sociologist Max Weber, is the ability to achieve goals with or without the society's support of these goals. In this chapter, we explore societal and political power by looking at three different power models: the pluralist model, the power-elite model and the Marxist model. These models will be differentiated by their perspectives on the source and nature of power. The pluralist model indicates that power is distributed among many groups. These groups may include coalitions of like-minded people, unions, professional associations and business lobbyists. The percentages of average people that make up these groups are small, so in theory, the public act as bystanders in the pluralist model of power. Power elitism is a theory that centers on the idea of how power is concentrated. In this model, sociologists argue that the majority of the power is concentrated among the wealthy. In this case, the wealthy refers to businesses, government, and the military. Due to the distribution of power to a few, it is argued that the average person cannot have his or her voice heard. In the Marxist model, sources of power include: (i) ownership and control of economic property, wealth, productive assets of society, and control of finance, (ii) control over ideas, through the media and processes of socialization, generally for instant education, ideology, and hegemony, and (iii) control over the state. So power is a means to make social actions possible as much as it may constrain or prevent them.

### Leadership

Leadership in organizations, political parties, and nation-states has been the subject of much sociological work since the very inception of the discipline, yet sociologists still disagree on the relationship between leaders and followers, whether leadership is about meaning or domination, and about the performance implications of different leadership styles. The theoretical assumptions and arguments of the four main schools of sociological thought on leadership –Weberian, institutional functionalism, neo-Marxist, and relational – focus on the historical origins of current work in the field. Weberian theory includes three types of leaders: bureaucratic, charismatic, and traditional. Weber was one of the first of the theorists to recognize that leadership itself is situational in nature, and that effective individuals need to move dynamically from one type of leadership style to another to remain successful. Proponents of institutional functionalism, mainly Spencer and Parsons, emphasized the Three Circles model of leadership, which defines leadership function as meeting needs in three distinct areas: task, team and individual. They also emphasized that no single leader is good enough alone; the leader will

require a team of people acting in the leadership collective in order to enact significant change with many people. Neo-Marxist and relational theories both emphasize leadership as situational and functional. Only a capable leader can lead a society. In fact, all these theories highlights that four qualities are essential for leaders: individualized consideration, intellectual stimulation, inspirational motivation, and idealized influence.

### Social Movement

A social movement is an organized effort by a large number of people to bring about or impede social change. Although social movements differ in size, they are all essentially collective. That is, they result from the coming together of people whose relationships are not defined by rules or procedures, but who share a common outlook on society. Sociologists have looked at social movements and offered several theories to explain how they develop. Three of those theories – deprivation theory, mass society theory, and structure strain theory – are discussed in this chapter. Deprivation theory was first described by Robert Merton, and states that social movements arise among people who feel deprived. According to this approach, when people compare themselves to others, they may feel that they are at a disadvantage. They join social movements in the hope of solving their grievances. This sense of having less (money, justice, status, or privilege) than other people, also known as deprivation, is the basis for social movement. According to deprivation theory, this comparison of situation results in a sense of injustice, which instigates the start of a social movement. A mass society is a society in which prosperity and bureaucracy have weakened traditional social ties. Mass-society theory was first developed by the political sociologist William Kornhauser. In his theory, Dr. Kornhauser suggests that people who feel isolated and insignificant within a society are attracted to social movements. Social movements, according to this theory, are influenced by the media, and provide a sense of empowerment and belonging that the movement members would otherwise not have. Miller's structure strain theory includes an explanation for deviant group behavior. When a person fails to achieve his/her goal, he/she is deviant and rushes to join the movement. Social movements are thus a type of group action. They are large – sometimes informal – groupings of individuals or organizations which focus on specific political or social issues. In other words, they carry out, resist, or undo a social change.

## Additional Important Social Context of Governance

### Political Party

The term "party" will be employed to designate associations, membership of which rests on formally free recruitment. A political party is first and foremost an organized attempt to obtain power. Power is here defined as control of the government (Schnattschneider 1951). Scholars who conceive of parties in functional terms do not necessarily ignore activity inside the party. But it is given importance only insofar as it influences the performance of party roles. There is an alternative conceptualization of parties, one that views them, in the first instance, as structures or settings in which activity takes place. For William Graham Sumner, parties are important because they "are constantly forced" to practice "antagonistic cooperation," which is "the most productive form of combination in high civilization." "It consists in the combination of two persons or groups to satisfy a great common interest while minor antagonisms of interest which exist between them are suppressed." This interpretation is identified as the most salient element of a party activity that occurs among its members. As such, it is at total variance with the prevailing definitions in the field. The difference seems to be associated with the starting point of the scholar's reflection. Sumner, a sociologist, began with an attempt to understand how people behave towards one another. His basic concern was social relations. Institutions are settings in which activity takes place. In sharp contrast, political scientists focus on politics and thus emphasize how other organizations affect the political system. They begin their reflections with the institutions of the nation-state. The type of work practiced by Sumner is not entirely foreign

to basic inquiry on political parties. In fact, the single most important study in the field adopted such a perspective. Roberto Michels's *Political Parties: A Sociological Study of the Oligarchical Tendencies of Modern Democracy* treats the party as a setting for activity and not as a structure that affects its environment. The focus is on describing and explaining the organizational life of socialist, working-class parties, not because of its consequences for structuring the vote or obtaining governmental power, but because the appearance of oligarchical phenomena in the very bosom of the revolutionary parties is conclusive proof of the existence of immanent oligarchical tendencies in every kind of human organization that strives for the attainment of definite ends. Michels made his decision to treat the party as a setting for activity in spite of the fact that the original stimulus for his study apparently came from Max Weber, who explicitly advocated examining its effects (Comparative Politics July 1983). Weber suggests to Robert Michels that he study the structure of the German Social Democratic party in order to understand the impact of the political parties created to mobilize the masses in electoral democracies on the economic and social structures.' The importance of Michels's work argues for a perspective that treats the party as a structured setting for human activity. Moreover, since parties do clearly occupy an intermediate position in the polity, these discussions make it clear that a political party is a group of people who come together to contest elections and hold power in the government. They agree on some policies and programs for the society with a view to promote the collective good or to further their supporters' interests.

## Civil Society

The term "civil society" was used by writers such as Locke and Rousseau to describe civil government as distinct from natural society or the state of nature. The Marxist concept derives from Hegel. In Hegel, civil or bourgeois society (as the realm of individuals who have left the unity of the family to enter into economic competition) is contrasted with the state or political society. Marx uses the concept of civil society in his critique of Hegel. It is used as a yardstick of the change from feudal to bourgeois society. Civil society arose, Marx insists, from the destruction of medieval society. Previously, individuals were part of many different societies such as guilds or estates, each of which had a political role, so that there was no separate civil realm. As these partial societies broke down, civil society arose, and the individual became all-important. The old bonds of privilege were replaced by the selfish needs of atomistic individuals separated from each other and from the community.

The fragmented conflictual nature of civil society with its property relations necessitates a type of politics that does not reflect this conflict but is abstracted and removed from it. The modern state is made necessary and at the same time limited by the characteristics of civil society. The fragmentation and misery of civil society escapes the control of the state which is limited to formal negative activities and is rendered impotent by the conflict which is the essence of economic life. The political identity of individuals as citizens in modern society is severed from their civil identity and from their function in the productive sphere as tradesmen, day laborers or landowners. Although Gramsci continues to use the term to refer to the private or non-state sphere, including the economy, his picture of civil society is very different from that of Marx. Gramsci insists on its complex organization as the ensemble of organisms, commonly called private, where hegemony and spontaneous consent are organized.

He argues that any distinction between civil society and the state is only methodological, since even a policy of non-intervention, such as laissez faire, is established by the state itself. A fully developed civil society is presented as a trench system able to resist the incursions of economic crises in order to protect the state. Whereas Marx insists on the separation of the state and civil society, Gramsci emphasizes the inter-relationship between the two. The state, narrowly conceived as government, is protected by hegemony organized in civil society, while the coercive state apparatus fortifies the hegemony of the dominant class. In any actual society, the lines of democration between civil society and the state may be blurred, but Gramsci

argues against any attempt to equate or distinguish between the Good Governance and Autocracy. And while he accepts a role for the state in developing civil society, he warns against perpetuating state worship. Gramsci redefines the withering away of the state in terms of a full development of the self-regulating attributes of civil society. In Marx's writings, civil society is portrayed as the terrain of individual egotism. Civil society acts through "social capital" – the capacity of people to act together willingly in their common long-term interest. Social capital is strong in a homogeneous, egalitarian society.

### Legitimacy

In sociology, Max Weber gives great emphasis to legitimacy. His views on law are best understood in relation to his general analysis of types of political authority. Weber provided, amongst other elements of his political sociology, a conceptual framework for systematic analysis of the role of law in securing political legitimacy. The significance of this conceptual framework lies partly in the fact that it reflects and promotes a view of legality and legitimacy that has been profoundly influential in the development of the sociology of law and in modern political and legal theory. But, in addition, its key concept, that of legal domination, is elaborated in the context of Weber's important analyses of the character of modern law and of the sociological significance of legal history, as well as his detailed studies of the development of the modern state. Thus, in Weber's writings, the relationships between law and power are analyzed with the combination of a lawyer's insights into the character of legal ideas and a great sociologist's synthesizing vision of patterns of economic, political, and social development in history.

## Conclusion

In sociology, governance addresses a wide range of issues, including social, economic, and political continuity, security and integrity, individual and collective safety, and the liberty and right to self-actualization of citizens. The aim of governance is to resolve societal problems as well as manage human resources in the required way, as reflected by the views of the majority. Sociologists are obliged to combine an empirical study of social phenomena and to critically analyze social forms and processes with the aim of producing policy guidelines directed both at governance and social movements. These guidelines aim at guarding fundamental civil rights, while facilitating negotiated change and accommodation of the aspirations of diverse communities and groups. Finally, in sociology, governance refers to all the processes of governing, whether undertaken by a government, market or network, whether over a family, tribe, formal or informal organization or territory by means of laws, norms, power, or language.

# Sociopolitical Factors Giving Rise to the Kurdish Question in Turkey

Ali Can
National Police Academy, Ankara, Turkey

## Synonyms

Collective violence; Ethnic identity; Exclusion; State policies

## Introduction: The Kurdish Question in Turkey

The Kurdish question in Turkey symbolizes such an opposition by the Kurds against the Turkish government. Having emerged as low-level rebellions, the Kurdish question indicates the social discontent of the Kurds due to the governmental policies made during the formation of the Turkish Republic. Most Kurds complain that they are stuck between the Turkish government and the PKK (the Kurdistan Workers' Party – Partiya Karkerên Kurdistanê in Kurdish language). On the one hand, the government wants the Kurds not to support the PKK; on the other hand, the PKK has a great suppression on the Kurdish folk from towns to the very small villages in the southeastern region of Turkey. The mountainous geography prevents the government from providing full security, and from making enough investment in the region, which, in turn, causes poverty and illiteracy. Thus, the Kurds have had to live in a very strange and stressful social lifestyle especially for the last 40 years.

Living in these social conditions forces the Kurds, especially Kurdish youth, to make a choice between the government and the PKK. Some Kurds want to get the cultural, linguistic, and political rights that will protect their Kurdish identity; others also seek autonomous regime in the Kurdish domain. Radical Kurdish nationalists, on the other hand, insist on democratic autonomous regime. At the beginning, the Kurds showed their reactions by resorting to rebellious activities. But, the government did not care what the demands of the Kurds were and suppressed the Kurdish rebellions by using military forces. This policy led to Kurdish dissatisfaction with the system growing into a formidable resistance (Mcdowall 2004). The Kurdish nationalists used grievances against the military operations and recruited members to start terrorist activities targeting official human, material, and economic assets. Since the 1980s, the Kurdish problem has left behind destroyed buildings, wasted energy and money, most importantly the loss of thousands of lives, and their mourning families who are still waiting for a clear-cut solution to the problem.

These perceptions led the governments to employ some social and political strategies in order to rebuilt social order and security in the southwestern region of Turkey. At the early stage of the problem, the Turkish Republic took the

Kurdish revolts just as a security problem and responded to the problem by eliminating the Kurdish insurgents. These intervention techniques did not end the problem, but provoked Kurdish resentment against the government. In the mid-1980s, the government realized that the Kurdish problem had not been formed in recent years and could not be eliminated with the short-term solutions such as the employment of military force. The government started economic investments in the southeast region of Turkey. These efforts helped in dealing with the problem but were not enough to satisfy the Kurds whose ultimate desire was being accepted as equal members of the society with their cultural rights and identity. The problem grew with wrong social and political strategies of the government and turned into a desperate terrorism problem represented by the PKK.

## Factors Giving Rise to the Problem

### The Kurdish Identity

The Kurdish question in Turkey symbolizes the ultimate desire of many Kurds to be accepted as citizens having different ethnic identity with the intrinsic characteristics (Cornell 2001). Ethnicity or ethnic identity has various roots such as language, religion, education, etc. These phenomena, however, are not enough for the structural process of ethnic identity (Karpat 1985). The social integration depends on several sociopolitical and ideological factors such as control of the material in its domain and the right of creating laws which are valid in the whole domain where the ethnic population lives. This process is defined as identity creation and mobilization of ethnic group.

There is little research on Kurdish ethnicity, and the existing research is questionable due to the fact that they were written with racial or cultural biases for or against Kurds. The ethnic origin of Kurds cannot be clearly defined because of their geographic, cultural, and genetic integration with Arabs and Turks (Bulloch and Morris 1993; White 2000). Another reason is that the Kurdish society is fragmented because they live as tribes, not as a national body (Mcdowall 1991). Every tribe has its own leader, and members of that tribe have to obey the rules made by the leader. This fragmented tribal structure of the Kurdish society has always created conflicts between the tribes, which is a powerful factor in the failure of the Kurds to emerge as a national entity.

There is no definite information about the origin of Kurds. The formation of Kurdistan, a mostly Kurdish-populated state, has never existed (Yıldız 1992). The first identifiable Kurdish people (Carduchis) have inhabited in the mountainous regions of the northern Mesopotamia for a period of 2–4000 years, but the identity of these people is still obscure (Bulloch and Morris 1993). The only trait connecting them to today's Kurds is their name and their location. The link of Carduchis lived in the Mesopotamia area to today's Kurds is not enough by itself to establish the actual origins of the Kurdish people.

It has been assumed that the Kurds converted to Islam after the conquest of the Caliphate of Omar Al Khattab against Persia and Mesopotamia in the seventh century. However, it is very difficult to reach any concrete evidence for the existence of a Kurdish state in the historical records (Genckaya 1996). Another argument is that Kurdish people were a sect of the Turanis from Central Asia, where Anatolian and Mesopotamian Turkish people originally came from. There are certain similarities between the Kurdish language and the language used by the people in the Ural-Altay region of Central Asia (Cay 1996). The roots of Turkish language are also connected to the Ural-Altay language group, and there are certain similarities between the two. These similarities suggest that Kurds are closer to the Turani people more than any other race in the world.

As many races lack of clear identifiable roots, it is very understandable to advocate belonging to a specific ethnicity. People can identify themselves with a particular nationality such as the Welsh, Irish, and Scots in England (Winrow and Kirisci 1997). Kurds had not had any nationalist claim till the end of the Ottoman Empire. They fought during World War I and the Turkish War of Independence along with the Turks.

The Kurdish question emerged with the formal change in the understanding of nationality

and religion in the governmental system. The pluralist understanding of nationhood during the Ottoman Empire was changed with the formation of the Turkish Republic, and a uniform understanding of the nationality was adopted. The concept of "Turk" became the basis of the citizenship. If all ethnic groups had found an equal place under this official identity, this concept could have been an inclusive identity. In daily practice, however, being a "Turk" has been uttered as an ethnic quality and became exclusive. The concept of the religion in the governmental system was also changed. Secularism became one of the most important bases of the Turkish Republic.

These radical changes in the governmental system during the formation of the Turkish Republic made the Kurds worry about their Kurdish identity. The Turkish governments' inability to come to grips with the demands of the Kurdish citizens for cultural recognition leads the Kurds to create a different national identity. The Kurds showed their reactions to these changes with local insurrections. The authorities did not pay too much attention to the Kurdish reactions. In order to draw the attention of the authorities, the Kurds employed violence.

**Political Motivation of the Kurdish Movement**

The Kurds continue to express their resentments and demands in the political arena through the BDP established in 2008. Although the BDP has a very short history, the political struggle of the Kurds has a very long history starting from 1990 when the Kurds decided to disseminate their opinions from the Turkish Grand National Assembly (TBMM) and established the People's Labor Party (Halkin Emek Partisi – HEP). The HEP coalesced with the leftist Social Democratic People's Party (Sosyaldemokrat Halk Partisi – SHP) in the 1991 elections, and 22 HEP representatives were elected to the TBMM. Leyla Zana, a newly elected representative, wore a headband consisting of the Kurdish colors (red, yellow, and green) and spoke in Kurdish when stating the official oath at the TBMM. These two choices Leyla Zana made resulted in the abolishment of the HEP by the Constitutional Court. The Democracy Party (Demokrasi Partisi – DEP) was formed to replace it in 1993. The president Suleyman Demirel and the prime minister Tansu Ciller of that time claimed that the DEP was the extension of the PKK. Their government supported the military struggle with the PKK. Mehmet Sincar, a DEP representative, was anonymously assassinated in September 1993. The legislative immunity of some other DEP representatives was revoked by TBMM. Some of them were taken under custody and sentenced by the State Security Court (Devlet Güvenlik Mahkemesi – DGM). Similar to the HEP, the DEP was closed by the Constitutional Court in June 1994.

As the Kurdish administrators of the party presumed the closure of the DEP, they established another party named the People's Democracy Party (Halkin Demokrasi Partisi – HADEP) in May 1994. Its destiny became the same as the other parties. The Kurds put out their own flag and Öcalan's posters and lowered the Turkish flag in the congress of the HADEP. Some members of the HADEP were taken into custody, and the HADEP was closed by the Constitutional Court in March 2003. The Kurds' persistence on stating their opinions through a Kurdish political party has continued, and they founded the Democratic People's Party (Demokratik Halk Partisi – DEHAP) in September 1997. The DEHAP enrolled in 2002 elections without completing proper paperwork for the establishment of the party. A case of closure was filed in the Constitutional Court. The administrators terminated the party without waiting the decision of the court and established the Democratic Society Party (Demokratik Toplum Partisi – DTP) in November 2005.

The DTP enrolled in the 2007 elections with independent parliamentary candidates named as "candidates of thousand hopes," and 22 of them were elected to the TBMM. Because of radical statements and attitudes of the members of the DTP, the chief prosecutor of the Supreme Court opened a case of closure again in the Constitutional Court in November 2007. The main reason of the case was declared as "becoming the center of activities against the unity of the state." The

Constitutional Court sentenced the closure of the DTP. It canceled the parliamentary membership of some party members in December 2009. After the closure of the DTP, Ahmet Türk, the chairman of the party, declared that the problem cannot be solved by closing parties. On the contrary, such actions deadlock the problem. Despite all these events, Türk said, we (the Kurds) believe that Turkey will catch the peace and democracy (NTVMSNBC 2010).

All these political struggles of the Kurds indicate that the Turkish governments did not show any tolerance toward the political expression of the Kurdish resentments because of the unwillingness in communicating with the unpleased Kurdish groups. This intolerance created the Kurdish perception that the Turkish government tries to assimilate the Kurds and lead them to support PKK's propaganda that emphasizes that there is no way to get the Kurdish rights other than using violence. The problem was not just the Turkish government's policies; the Kurds are also not willing to understand that the source of this intolerance is the persistent radical attitudes of the Kurdish politicians. The main issue that closes the doors to the political struggle of the Kurds is the violence-based activities of the PKK.

## The Activities of the PKK

Abdullah Öcalan (the founder of the PKK) was a member of this Marxist Kurdish organization. He disseminated his opinions of social injustice and Kurdish identity and used the grievances during the military operations against Kurdish folk as a means to recruit many Kurdish young people. His statements flourished in the economically undeveloped east part of Turkey. Recruiting enough supporters for his movement, Öcalan wrote *The Way of Kurdistan's Revolution (Manifesto)* (*Kurdistan Devriminin Yolu (Manifesto)*) and established the PKK on November 27, 1978, in the village of Fis in Diyarbakir.

The primary aim of the PKK as an ethnic terrorist group is to create a separate state or to elevate the social status of the Kurds (Byman 1998). The main argument of PKK is that the historical grievances in the last century under the rule of Ottoman Empire and the Republic of Turkey left no choice other than using violence. The grievances experienced by the Kurds because of the harsh counter policies of the government were used by the PKK to legitimate its existence (Ekici et al. 2007). The PKK placed a great deal of emphasis on language because it is the main trait of national identity (Weber 1978). By using language, the PKK attempts to strengthen the idea which to be a Kurd does not mean to be a Turk that is the identity proposed by the Turkish government. Discerning the ethnic identity from the identity proposed by the government affirms the distinct nature of the ethnic group and gives great advantage to the PKK as an ethnic terrorist group. Therefore, the PKK forces the Kurds to use Kurdish language in social and official life.

The PKK creates fear to force the rival groups to emigrate from the southeast region because they want to strengthen ethnic identity by changing the demographic structure of the region. Due to the fear created by the terrorist group, individuals who are not willing to attend insurgencies have to cooperate with them. It is not difficult to convince the ethnic population by insurgents due to their bitter experiences with the PKK. The PKK is effectively using this method in the East Anatolia. In order to obtain the population advantage, PKK terrorists force the Kurdish population to migrate from much Kurdish-populated areas to less Kurdish-populated areas. With this tactic, they aim to win the mayoralty elections, which in turn will provide some extended autonomy for the Kurdish radicals.

Political activities are also very important for the PKK. Political party serves as a legal home base for the urban militants. Through this legal structure, new members are recruited to the terrorist group. During the mayoralty elections in 2009 in Van, members of the Peace and Democracy Party (Bariş ve Demokrasi Partisi – BDP) create great fear on the public to force them to vote for BDP. They got all official posts in many election rooms and checked most of the voters to be sure

they voted for BDP. In this manner, they become apparently institutionalized under the legal structure of the state and organize the political struggle against the government.

### Counter-Strategies of the Government

After the establishment of PKK in 1978, the course of the Kurdish question has evolved around the constant increase of the violent PKK activities and the counter policies of the Turkish governments against those violent activities. The tug-of-war between the PKK and the Turkish government resulted in the victimization of the Kurdish civilians. Turkey's response varied according to political conjuncture after the first attack was carried out on August 15, 1984. PKK had attacked to the houses, where military and police officers lived, in Siirt and Hakkâri.

On June 20, 1987, PKK killed 30 villagers – 16 of them were children – in Mardin (Ergil 2000). Upon this attack, the Turkish government initiated a couple inquiries to get information about PKK. Depending on the information gathered, the government decided to employ several methods. First, the government deployed military troops in the southeast region. The army was appointed to making counter operations, conducting routine patrols, and providing convoy protection. Besides, two elite units of special forces were created to counter PKK terrorism: *special teams* working as a unit of gendarmerie in rural area and *special operation teams* working as a unit of police in urban area. Police Special Operation Teams of the Turkish National Police made a name in fighting with the PKK and attended some operations with other forces. In addition, the government propelled air forces and conducted air attacks to PKK camps in the mountainous regions.

Second, the government organized an armed village guard system from the Kurdish villagers. The tribal leaders were assigned as the head of the village guard system. By using this system, the government was aiming at creating a local opposition to PKK militants. This system, however, brought about the misuse of power of tribal leaders and the antagonism between Kurdish villagers and PKK militants. In 1985, PKK attacks increased against civilians who were supporting the village guard system. PKK militants threatened everybody who was likely to deal with the village guards. Abdullah Öcalan ordered to kill families of the village guards because they were seen as "state collaborators" (Imset 1993). This polarization among the Kurdish folks forced the people to pick sides with the PKK or the government. Due to the deficiency in the educational system and lack of communication technologies such as the Internet and TV broadcasting in the area at that time, some people, especially young Kurds, were easily convinced by the PKK to fight against the Turkish government. With the increased number of militants, the PKK created new units of fighters.

The government could not establish an effective way to prevent the outburst of the PKK. It declared the regional "state of emergency management" (Olaganustu Hal – OHAL) in the Kurdish-inhabited zone including the cities of Bingöl, Diyarbakir, Elazığ, Hakkâri, Mardin, Siirt, Tunceli, and Van in 1987. A short time after this declaration, the region of "emergency management" was expanded, and this situation continued for almost 20 years.

After the declaration of the OHAL, severe armed fight with PKK terrorism started. Turkish military authorities outlawed the Kurdish organizations and banned all forms of ethnic, rebellious, and leftist movements with the coups in 1971 and 1980. Many people including Kurdish nationalists were jailed, the use of the Kurdish language was forbidden, the Kurdish names of the villages were changed with the Turkish names, and Kurdish families were coerced to give Turkish names to their children (Ergil 2000). These military coups aiming to ensure the integrity of Turkish society created the perception of deliberate discrimination and assimilation by the Turkish government in the minds of Kurdish nationalists.

These policies started a real destructive war with PKK terrorism. The primary victims of this war were civilians who were stuck between the security forces and PKK. They faced with both the

suppression and execution of PKK and the strict implementations of the Turkish authorities such as the evacuation and destruction of villages suspected of helping the PKK. According to the US Department of State's 1996 Country Reports on Human Rights Practices, 2297 villages had been evacuated or destroyed, and two million Kurds had been forced to leave their homes or villages (Ergil 2000). Starting from 1996, the OHAL was gradually terminated, and in 2002, it was totally lifted. The policies implemented during the OHAL process, however, restricted daily social life and caused grievances in the Kurdish population. The declaration of the OHAL and counter strategies against PKK after the OHAL were major causes turning the Kurdish problem to an extensive ethnic terrorism.

Consequently, restrictions on social and cultural freedom, arrests, and the oppressive regime pared with the military coups strengthened the separatist Kurdish nationalist movements and helped the creation of PKK. The strict policies of military regime after the coup in 1980 did not succeed in deterring the Kurdish nationalist movement; on the contrary, those policies stirred up the Kurdish problem. The ruthless suppressive policies of Turkish officials due to the worry of separation of the state created great dissatisfaction in terms of demanded cultural, linguistic, and political rights and caused the formation of Kurdish extremism (Olson 1996).

## Conclusion

The evolution of Kurdish question in Turkey clearly represents the destructive effects of state actions on the feelings of national identity. Repressive policies during the establishment process of the Turkish Republic caused resentments in Kurdish community. Using security forces to repress Kurdish protests and rebellions increased the number of Kurdish victims and disseminated the resentments in Kurdish community. The Kurds perceived these state policies as a threat against their identity and culture. Then, a Kurdish radical group established PKK terrorist organization in order to use violence to save their identity and culture. At the earlier stage of PKK terrorism, the Kurdish folk had not given much support to PKK terrorist organization, but wrong state policies toward the Kurdish question increased the support to PKK.

All this chaos between the PKK and the Turkish government force thousands of families to migrate to other safe cities. This migration increased the poverty level and street crime in the region (Durna and Hancerli 2007). Because of the supporters from the Kurdish population living in Iran and Syria and the strategic involvement of European countries, the Kurdish question has been internationalized and become a much more complicated phenomenon than a terrorist organization. After the 1990s, Turkish governments started to follow moderate policies such as developing economic and social conditions in the regions where the Kurdish population mostly lives. The efforts of the Turkish government to strengthen the loyalty of the Kurds to the state are called today as "democratic opening." The ongoing process of "democratic opening" indicates that nobody is optimistic about the success of the project because of the nontransparent nature of the project. Both parties accuse each other of being insincere and of having secret agendas.

In sum, the Kurdish question is the product of a blending of social, economic, cultural, and political determinants emerged in an environment in which the government and the Kurds are not willing to understand each other. Reciprocal misperceptions and prejudices prevented the parties from understanding and reaching to the roots of the problem constructed over the time. The authorities' unwillingness in communicating and understanding the concerns of the Kurds was perceived as humiliation and discrimination by them. This perception, then, brought about hate and loss of identity and self-respect and increased the risk for fanaticism and terrorism. The Kurds argue that the governments' approach left them no choice other than resorting to collective violence and terrorism. This preference is mainly related to ethnic, cultural values and the reluctance of the parties in communication. The claim of belonging to a specific race, ethnicity, or nation may not be valid, but

it is the fact that there is such a group of people defending this claim. Addressing different perceptions does not entail accepting them as reality; however, taking them into account can provide a true approach to solve social problems.

# Socio-technological Aspects in Disaster Mitigation

John J. Kiefer
University of New Orleans, New Orleans, LA, USA

## Synonyms

Crises; Emergencies; Hazards

## Definition

Measures that eliminate or reduce the impacts and risks of hazards through proactive measures taken before an emergency or disaster occurs.

A clear understanding of the concept the socio-technical dimensions of disasters is critically important for those responsible for mitigation. Leavitt and Kiefer (2006) recommended that emergency planners look at disaster mitigation from a systems approach. They argued that it was important not only to appreciate how social and technical systems were vulnerable when disasters happen but perhaps more important to understand that significant failure is often most common where different systems converge.

## What Is Mitigation?

Three common themes emerge from the definitions of disaster. First, the mitigation of disasters is a sustained and ongoing event, unlike disaster relief, which is short term (Haddow et al. 2008). Second, mitigation is designed to lessen or diminish the negative impacts of a disaster on people,

property, and the economy (Birkland 2006; Clary 1985). Finally, mitigation is a strategic activity that involves identifying the specific risks that disasters pose and developing policies to alleviate them (Bogard 1988; Sylves 2008).

There are four phases of emergency management: preparedness, response, recovery, and mitigation. Many believe mitigation to be the foundation of emergency management because of its long-term and strategic focus. Nonetheless, these four stages are interrelated, and all the stages are focused on loss reduction.

Given the nature of complex systems, multiple and unexpected interactions of failures are inevitable (Perrow 1984, p. 5). System failures often involve the unanticipated interaction of multiple systems. When communities experience a catastrophic disaster, two major components are often responsible. These include a community's social systems and its technical systems.

A community's social system is evident in its people and their interaction. Merriam-Webster (2016) defines a social system as "the patterned series of interrelationships existing between individuals, groups, and institutions and forming a coherent whole." A technical system consists of the critical infrastructure that is the lifeblood of a community. The term *critical infrastructure* is often used in the emergency management literature:

> Critical infrastructure includes systems, facilities, and assets so vital that if destroyed or incapacitated would disrupt the security, economy, health, safety, or welfare of the public. Critical infrastructure may cross political boundaries and may be built (such as structures, energy, water, transportation, and communication systems), natural (such as surface or ground water resources), or virtual (such as cyber, electronic data, and information systems). (Critical Infrastructure 2016)

Other examples of critical infrastructure include pumping stations, dams, and levees.

One of the most visible failures due to socio-technical breakdown was evident when Hurricane Katrina devastated New Orleans. There was a failure between the social and technical systems that were critical to community resilience. There was a highly vulnerable population and an inadequate transportation system. The lack of a viable transportation system for immobile citizens had been the subject of many initiatives, but no explored alternative could guarantee transportation for 100,000 citizens. This was a city with a large population of urban poor and a lack of adequate shelters in the floodplain. The city failed to address the widely understood problem of the sheer number of "immobile" citizens in an evacuation – citizens with no means of transportation out of harm's way. Additionally, it was expected that large numbers of tourists would also be rendered immobile. This was a clear example of a socio-technical system breakdown.

Another example from the Katrina experience was that weaknesses in the levee system – a technical system – were known for many years. The problem had been identified to the federal government, but federal funding was still woefully inadequate. This problem was compounded by its interface with a flawed social system, a system that permitted technically unqualified levee "inspectors" to be appointed by elected officials. This system of political patronage resulted in levee breaches that flooded the city.

One promising social initiative, dubbed "Brother's Keeper," sought to address social and technical systems. Its purpose was to link immobile citizens with those willing to share transportation through churches, synagogues, and mosques in the city's less affluent areas. Yet a major blow to this initiative came when the state's legislature refused to extend "Good Samaritan" status to drivers providing transportation, in turn causing the Archdiocese of New Orleans to refrain from participating (New Orleans is a predominantly Catholic city). This resulted in less than ideal implementation of the initiative.

## The Socio-Technical Interface: System Failure

The network of technical systems is, at some point in every system, dependent upon social factors. Katrina exposed many vulnerabilities that contributed significantly to the disaster, most stemming from socio-technical interdependencies. The first to emerge post-Katrina was the unfortunate reliance upon human operators in several pumping stations. Immediately prior to Katrina, Jefferson

Parish President Aaron Broussard relieved of duty the human operators of several important pumping stations, fearing for their lives and ordering them to safety well beyond the region (Krupa 2005b). In fairness to president Broussard, his decision was not undertaken lightly and was indeed a standard procedure in the long-standing Jefferson Parish emergency plan. Unfortunately, when Katrina struck, several important pumping stations (the technical systems), which were therefore left without operators (the social system), contributed to significant flooding due to levee failures (Krupa 2005a).

Another example of a socio-technical interface failure contributing to the disaster in New Orleans resulted from the lack of understanding of critical infrastructure interdependency across municipal boundaries. As the levee system began to fail, and water started to rise in the city, adjacent parishes hastily called upon their public works departments to construct temporary levees along parish lines, with little reliance upon accurate flood maps (Brown 2005). The result was that, in some places, rising water was effectively slowed, but in other locations, barriers were useless, consuming valuable time and the limited resources of already-stressed public works departments in their construction. Many of these temporary levees served to effectively block evacuation routes from the city, hindering the exodus of city residents. This, combined with an aggressive law enforcement presence in some of the city's neighboring municipalities, exacerbated racial tensions and further crippled timely evacuation of New Orleans (Fletcher 2005).

## Risk and Vulnerability Assessment

Clearly there is a need to better understand how cascading failures of socio-technical systems hinder response and recovery efforts. The central feature of all crises is a sense of "urgency," and urgency often becomes the most compelling crisis characteristic according to Farazmand (2005). He notes that crises scramble plans and paralyze normal government operations (p. 6). It is imperative that technical managers understand that they cannot prepare for everything or figure it all out ahead of time. The military has long known that dealing with the "fog of war" requires the ability to improvise "on the move" and that flexibility and nimbleness must be highly valued. The development of training scenarios that place a premium on flexibility and nimbleness would increase the effectiveness of disaster response by minimizing dysfunctional socio-technical interfaces. As Swope and Patton (2005) observe, officials need to develop workable response structures or plans that are nimble enough to allow them to respond to all types of disasters (p. 58).

## Implementation Considerations

To mitigate the impact of failure in socio-technical systems and thus ensure community resilience, stakeholders must develop ways to better understand socio-technical interdependencies. The process for implementing this understanding would begin with promoting awareness and understanding. Specific recommendations include:

- Incorporating requirements to identify socio-technical interdependencies into organizational vulnerability assessments and response/business continuity plans.
- Developing a socio-technical interdependencies identification "template" that organizations can use for this purpose.
- Undertaking a pilot project to create a socio-technical interdependency database provided by interested stakeholders that can be used for preparedness planning. This database would be designed with appropriate security and access protocols.
- Develop a model in-house socio-technical interdependency exercise process for use by stakeholders to educate their personnel.
- Undertake a regional threat assessment that includes private and nonprofit sector organizations and includes an impacts analysis of socio-technical interdependence.
- Investigate undertaking, with federal government support, pilot projects to develop socio-technical interdependency analysis systems that can be used for preparedness planning and response and reconstitution. For example,

analysis tools could be developed to assess the impacts of closing highways, bridges, and railways on public safety/evacuations and expeditious response and reconstitution of a community's social systems.
- Hold periodic regional and targeted socio-technical interdependency tabletop and field exercises to ensure training of key staff.
- Establish a Regional Emergency Operations Center (REOC) staffed with government response agencies and commercial and non-profit service providers. This regional EOC would establish operating procedures to integrate decisions and ensure resources are focused most effectively on both social and technical systems.

While most organizations have emergency response plans, these are often created in isolation, focused on internal needs, and are not coordinated with similar organizations. To be truly effective, these plans must carefully address the potential weaknesses where social and technical systems are interdependent. For example, emergency planners must develop and implement coordinated, region-wide public information plans to address large-scale disaster situations that impact socio-technical systems, particularly those that involve terrorist attacks.

For a community's social systems, providing the public with timely and accurate information without inciting panic is critical to relieving "stress" on the technical systems (such as roads, telecom, banking, etc.) that may result if mass evacuation is required. The need to provide situational awareness information to the public as a means of maintaining control, maximizing public support, and minimizing casualties is critically important. For example, people trying to get to their children or loved ones in a mandatory evacuation scenario could easily endanger themselves or fellow citizens by getting on area roads. Others may see a disaster as an opportunity to loot unprotected businesses. Self-evacuations of large numbers of people could quickly contribute to traffic gridlock. To better relieve stress at the interface of socio-technical systems, planners should:

- Develop a coordinated, regional public information strategy that includes means to disseminate information during a region-wide crisis.
- Identify responsible members of the media and include them in regional preparedness planning and exercises, and provide training as necessary.
- Further refine procedures to provide public service announcements, including developing alternate and redundant ways to inform the public during a regional disaster. For example, neighborhood information dissemination procedures could be developed.

## Conclusion

The importance of identifying, understanding, and analyzing socio-technical interdependencies must be recognized if communities are to respond effectively to disasters. Whenever possible, the goal must be to find ways to allow for understanding, addressing, and implementing the decentralization of socio-technical systems to promote rapid recovery from disasters.

# Solid Waste Management in Urban Development

Pamela Ransom
Metropolitan College, New York, NY, USA

## Synonyms

Municipal solid waste management; Urban solid waste management; Waste and resource management

## Definitions

| | |
|---|---|
| Municipal Solid Waste Management | The field dealing with control of discarded materials, refuse, garbage, or trash within a city jurisdiction. This includes all aspects of regulation, planning, storage, transport, processing, treatment, and disposal, with the aim to protect a jurisdiction's fiscal stability and also public health and the environment. |

## Introduction

Management of solid waste in cities is an essential function becoming more complex as a result of global urban population growth. With municipal waste increasing exponentially, cities in the developed and developing world face immense management, fiscal, and technical needs. Waste has been labeled an urban problem, with municipal volumes twice that of rural areas. In addition, waste poses significant challenges to city fiscal health and quality of life. In most places, cities and local governments play the lead role, although responsibility for aspects of management, such as policy or planning, is sometimes shared with national, regional, or state actors. Management involves administrative, and operational decisions, with the overarching policy and regulatory framework setting the stage for implementation. This includes allocation of manpower, facilities, equipment, land, and public information.

This introduction to the field of urban solid waste management (SWM) provides a short historical overview and discussion of global generation, along with review of the evolution of theory about the field. Key elements of the municipal waste management process are explored including the role of partnerships and planning. This helps explore the extent to which rationalized planning, data, and analysis guide decisions and action and the degree to which disparate political, institutional, and historical forces result in influences from more ad hoc systems involving not only government but also the private sector, civil society, and informal players. Finally, the way forward is discussed.

## Historical Background of Solid Waste Management

The challenge of waste was part of the lifeblood of cities since their inception, with evidence of municipal involvement in ancient cities in the Indus Valley and Greece (Marshall and Farahbakhsh 2013). Most older cities throughout history were relatively squalid, with unregulated waste dumping, tossing, and scavenging.

Increased disease spread including cholera, dysentery, diarrhea, malaria, and fecal contamination was a result. Municipal management practices known today began taking hold in the nineteenth century, with European cities instituting laws and establishing institutions given mandates to manage waste (Allister 2015). Waste expanded dramatically with the industrial revolution as a result of increasing population growth. Greater focus on the environment, concerns about public health, strengthened technologies, and public institutions at global and national levels helped modernize the landscape of waste management in cities over the next half century.

While cities and local governments bear prime waste management responsibility in many countries, there are clearly problems with capacity of policy makers and administrators to deal effectively with waste, particularly in developing countries. This is compounded by challenges in role allocations between government levels. In some places such as Japan, a careful balance between national and local government facilities efficiency, with localities creating plans, constructing facilities, and collecting data while the national government provides overarching strategy, resources for facilities, and a central database (Mekonnen and Tokai 2020). In Europe, city waste policy was increasingly influenced by centralized EU rulings, first in 1975, following enactment of a waste management hierarchy, then in the 1990s with tightened regulations governing landfills food waste and packaging, and again in 2008 with a recycling framework.

In North America, the mid-1960s through the early 1980s marked a turning point in the United States, when a waste crises emerged from widespread dump closures. Solid waste management solidified as a field with significant legislation enacted including the Solid Waste Disposal Act of 1965 and Resource Conservation and Recovery Act of 1976 (Hickman 2003). The city of San Francisco, for example, now a leader in waste landfill diversion, evolved systems based on earlier laws institutionalizing an exclusive partnership for waste collection with the private sector and then tightened regulations for landfill diversion in the late 1980s, instituting composting mandates in 2009.

In Africa, cities like Cairo began formalizing municipal waste management in the 1970s with other cities across the continent engaging in years of grappling with management challenges including complex, uncoordinated informal sectors and legal/institutional systems, need for increased public awareness, and overreliance on landfilling. Instituting effective waste management policies also remained challenging in rapidly urbanizing parts of Latin America and the Caribbean, because of weak bureaucratic institutions, lack of enforcement, and adequate monitoring and finance. Cooperative arrangements between cities in Brazil attempt to strengthen weaknesses in management capacities of particular municipal jurisdictions. Southeast Asia is an another region suffering from absence of effective urban solid waste management administration and policy, with heavy reliance on the private or informal sectors (Zhou et al. 2017; Hettiarachchi et al. 2018).

## Urban Waste Generation

Despite city and sectoral data limitations, evidence affirms exponential growth in waste in cities worldwide. The World Bank estimates noted growth from 1.3 billion tons of waste annually from cities in 2012 to 2.1 billion tons by 2016. This will increase even further to 3.4 billion tons by 2050 (Kaza et al. 2018; Hoornweg and Bhada-Tata 2012). East Asia and the Pacific generate the most waste globally, with volumes in Indian cities alone, increasing eightfold since the 1940s (Jha et al. 2008). In Latin America and the Caribbean, with almost 80% of total population now urbanized, a 60% growth of waste is projected by 2025 (UNEP 2018b). African municipal waste will triple from 2012 levels to 81 million tons by 2025, with the region generating more than other world regions by 2100.

In cities worldwide, positive relationships exist between per capita waste generation, level, type of development, and income (Wilson et al. 2012; Chalmin and Gaillochet 2010; Hoornweg and Thomas 1999). Higher income countries generate over one third of the world's waste, more than double their share of global population. Regions

with the highest urbanization produce the most waste per person. However, waste volumes increased faster with income growth in low, versus high income countries. Europe, the United States, and Canada produce the highest levels of municipal waste per person at levels of 2.15 kg per day, while three regions, Eastern Europe and Central Asia, Latin America and the Caribbean and North Africa and the Middle East, producing lower and similar amounts ranging from 1.12, 1.09, and 1.07, respectively. At the other end of the spectrum, regions with the lowest rates include East Asia and the Pacific and Africa with rates of 0.95 and 0.65 (Hettiarachchi et al. 2018; Kaza et al. 2018).

Waste composition in cities is influenced partially by country context, with paper making up higher proportions of the waste stream in municipalities in high income countries. Some large cities now show reduced reliance on paper because of increased computerized communication and lighter packaging. Plastics are higher than glass and metals, ranging from 5% to 17% of the waste stream in samples of 20 cities. In contrast, organic waste comprises lower waste stream proportions in more affluent countries in Europe, North America, and Australia, where it was 28%, versus 67% in middle and low income developing countries (Wilson et al. 2012).

Municipal waste includes other materials ranging from dirt, dust, street sweepings, textiles, rubber, leather, and ash (UN Stats 2018). Waste is categorized as either durable or nondurable, including some combustible materials. Cities have a range of waste generating sectors, with household amounts for example, influenced by factors including education, income, and total persons per occupant group (Guerrero et al. 2013). Specialized wastes including industrial, construction and demolition, hazardous, electronic or e-wastes are often classified outside the general municipal waste system. Construction alone generates concrete comprising over two thirds of the waste in the three countries, China, India, and the United States responsible for half the world's waste. Growth in urban hospitals, clinics, and laboratories increases both general as well as specialized medical waste including infectious, radioactive, and hazardous materials. Commercial establishments are also sometimes managed separately from residential streams. However, for all waste, availability, and reliability of up to date, city disaggregated data impacts accuracy of analysis. In Asia, for example, less than 50% of countries had adequate data on city waste (UNEP 2017).

## Theoretical Evolution

Theoretical frameworks for municipal waste management have evolved over time responding to changed understanding of linkages between urbanization, institutions, social and economic development. Véron et al. (2018) identify the "hierarchical institutional" model which places the municipality as the central focus in waste management that is influenced not only by higher level governments, but also global experts and local level actors including civil society organizations, associations, or private sector service providers. This reflects a long history of institutional theorists emphasizing formal rules, state structures, and practices as the framework for analysis.

A waste management hierarchy emerged in European legislation with theorists from Columbia University formalizing the concepts in the period of 2008 and 2009 (Kaufman and Themelis 2009). This gained acceptance worldwide, guiding urban and national waste policy towards prevention and sustainability. The hierarchy outlines waste management preferences, with prevention as the most preferred option, followed by reuse in second place. Next comes recycling with waste--to-energy and recovery or incineration in third place, with landfilling placing last (Filho et al. 2016). Prioritization reflects assessment of implications of approaches for health and the environment since the least preferred options, incineration and landfilling, generate higher greenhouse gas emissions. Other frameworks embodying similar principles include the circular economy, emphasizing reuse, and the 3R's (reduce, reuse, and recycle). This is popular in Singapore, Hong Kong, and other parts of Asia.

The hierarchical institutional model is criticized for over emphasis on technical/institutional approaches and assumptions of good governance,

modern management, and engineering, applicable primarily in developed countries. Integrated solid waste management became popular in the 1990s increasing attention to linkages between social, environmental, and economic aspects of waste systems. Most recently theorists continue to move beyond emphasis on formal institutions and technologies, with attention to innovation and contextual adaptation, particularly in developing countries. Urban waste systems involve material transformation as resources become goods, moving from production to final discharge, with the informal sector often critical related to employment. Thus, social mobilization, participation, co-management, collaboration, and appropriate technologies play a role at various stages of the urban waste chain. Urban political ecology helps dissect power as another component of the organizations, stakeholders, and institutions involved in urban waste management systems (Véron et al. 2018).

## Role of Participation and Planning

Structures for both participation and planning are key building blocks in urban solid waste systems. Effective management and partnership go hand in hand, influencing not only governance, but also policy and operations. Stakeholder management involves mapping and assessment of intersections between government agencies and a range of non-governmental actors, including contractors, recycling companies, waste pickers, NGOs, and other informal sector and civil society actors. These play different roles in particular localities and shape subsystems influencing municipal waste management policy. Guerro et al. (2013) review of the literature with respect to developing countries highlights the importance of organizational complexity and system multidimensionality.

Planning solid waste management is an important tool for better system control, although the extent of use currently varies between cities. A recent study of 368 cities found only one third with solid waste plans (Kaza et al. 2018). While projections point to pressing need, effective planning can be daunting. Planning provides opportunities for policy makers to rationalize assessment of not only the current state of waste in an urban area but also future long-term opportunities and challenges. Central components of an effective system include not only guarantee of comprehensive collection, but also protection of health and the environment, use of appropriate technology, and inclusive decision-making (UNEP and ISA 2015; Raggossnig 2018). Plan formulation involves identification of goals, objectives, and collection of comprehensive supporting data on current and future population and waste characteristics. The city plan should articulate the time frame being considered and range of categories the plan will address including sectors and types of wastes.

Outlining alternatives, environmental and economic impacts, and review of institutional, policy, and legal frameworks should be included. Scenario development, big data technology, partnerships with academics, innovation scanning, community mapping, or linkages to network experts are additional tools to enhance the planning process. Planning provides opportunities to work with key stakeholders in the urban waste management system, including the informal sector. Advisory groups provide circular feedback, channeling advice to policymakers, and information back to communities. This may involve controversy in terms of agreement on goals and objectives; thus, support for communication, logistical coordination and attention to diversity, gender, and inclusion of marginalized groups are key. After plan formulation, dissemination, and adoption, implementation is the critical next step. However, often follow-up falls short, with one study finding implementation of only 2/3 of city solid waste plans (Kaza et al. 2018.

At the global level, mobilization of government and civil society stakeholders helped shape urban waste management policy guidance found in the 2030 Agenda for Sustainable Development and United Nations Sustainable Development Goals adopted in 2015. This includes principles influencing cities worldwide. Goal 11 on sustainable cities includes target 11.6 aiming to reduce the adverse environmental impact of cities, with attention to air quality and municipal solid waste.

The framework for data collection and monitoring through subindicator 11.6.1 tracks proportion of total municipal waste generated that is not only regularly collected but with adequate final discharge. By 2017, Australia and New Zealand were the most successful reaching targets with rates of 94%, followed by Europe and North America at 89.6%. This contrasts with sub-Saharan Africa at only 43.4% and Central and South Asia at 66.7%. Midrange areas include Latin America and the Caribbean, North Africa and West Asia, and East and Southeast Asia, ranging from 80.4% to 73.5% (Richie and Mispy 2018). SDG Goal 12 on sustainable consumption and production targets various forms of waste including food, hazardous, and chemical waste with target five focusing on waste reduction through prevention, reduction, and recycling by 2030, although not explicitly mentioning the city level. While governments and partnering organizations worldwide track and discuss progress at the UN each year, local level monitoring focuses on Voluntary Local Reviews, which are still inconsistent in reporting on waste.

Another important global platform, The New Urban Agenda, shaped at the Habitat III Conference in Ecuador and adopted by the UN in 2016, commits governments worldwide to an environmentally sound waste management and reduction system (United Nations 2017). The UN Habitat Waste Wise Cities Campaign calls on global cities to adopt waste management principles such as commitments for assessment and improvement of collection and inclusion. An advisory group of organizations includes the International Solid Waste Management Association and Global Alliance of Waste Pickers among others. This campaign moved beyond the 3R's to embrace the 5 R's as a guiding framework, calling for cities to Rethink, Reduce, Reuse, Recycle, and finally Refuse single use items. The Climate and Clean Air Coalition, is another dynamic international partnership helping bridge gaps between climate change and waste by focusing on short lived climate forcers or pollutants generated from landfills and incinerators, through their Municipal Solid Waste Initiative. This Coalition works with the C40 network of the world's largest cities, through a Sustainable Waste Systems network. The World Bank Group has also been a significant player, funding urban solid waste initiatives throughout the world, with other national organizations such as the Municipal Waste Management Association in the United States driving conversations through linkages between city waste managers. Wastepickers mobilized through key actors such as WIEGO and the Global Alliance of Wastepickers with conferences held since 2008. The International Partnership for Expanding Waste Management Services for Local Authorities is another UN Commission for Sustainable Development initiative linking local authorities and private sector actors.

## Reduction and Recycling

With respect to waste reduction, approaches taken by cities to guide policy emphasize voluntary or mandatory approaches. Public education can highlight importance of reducing waste or influence behavior through financial measures such as charges for plastic shopping bags. By 2020, substantial numbers of cities tightened measures in 127 countries with involuntary bans popular in 18 African countries, 9 Asian countries (including India and China), 4 European countries, and 1 South American country. Taxes are popular in Europe and the UK, South Africa, Botswana, Mozambique, and French Guyana. Partial bans or taxes are policy instruments used in six Asian countries, five Latin American countries including Brazil, Bolivia, Argentina, Chile, and Mexico, three African, and two European countries as well as Greenland. These measures are instituted in 200 cities or counties in the United States alone, with eight states implementing regulations against plastics. Bans on plastic bags at point of sale are controversial in some cities due concerns about unintended consequences, including increased paper or cloth bag waste.

Waste reduction is championed through the Zero Waste movement which emerged in recent decades with impetus from Zero Waste conferences, first starting in New Zealand. Cities throughout the world embraced commitments to keep trash from reaching landfills and

incinerators. In the United States, San Francisco is a recognized leader, unveiling early ambitious goals of zero waste by 2020. Many other cities including New York, Austin, San Diego, and Boston also signed on. By 2018, over 20 cities worldwide signed Advancing Towards Zero Waste Declarations with pledges to cut per person waste 15 per cent by 2030, reduce by half waste going to landfills or incinerators, and elevate diversion to 70 per cent by 2030. Tokyo, Tel Aviv and Dubai, Auckland, Sydney, Catalonia, Navarra, Copenhagen, London, Paris, Rotterdam, Vancouver, Toronto, Washington DC, Santa Monica, San Jose, San Francisco, Philadelphia, and Portland are the involved cities. There are however examples of cities such as Buenos Aires, who established Zero Waste goals as early as 2005 but faced challenges working towards their ambitious pledges, with only 23% reduction achieved by 2015 despite extensive public education. Lack of incentive based fees was part of the problem (Ceva-Alverez 2019; Gutman 2020).

In the waste hierarchy, recycling is the next preferred option after reduction or reuse. Recycling has taken place in cities throughout history, providing income for the urban poor, through activities of junkmen, scavengers, and bottle collectors. Formal municipal government run recycling programs emerged in cities with initiatives often targeting streams of paper, glass, cans, organic material, or fiber, with varying levels of success. In Europe, Germany, Wales, Austria, Denmark, Norway, and Switzerland were leading municipal recycling by 2017, with rates just over 67%. Strict laws, stiff fines, reverse vending machines, and multicolored bins are strategies to increase rates. Ljubljana in Slovenia achieved a 68% rate, by reducing general waste pickups, distributing recycling bins, creating recycling centers, fix up workshops, and zero waste stores (Dakskobler 2019). The United States recycles over one third of its waste, with cities like San Francisco and Los Angeles leading (Brewer 2020). In Asia, Singapore achieved recycling rates of 61%, although Asian rates hover around 17%, while Taipai's pay- as-you throw taxes paved the way for Taiwan to achieve rates as high as 55% (Hettiarachchi et al. 2018). China's policy to do away with imports of used paper and plastics in 2017 disrupted cities worldwide heavily dependent on the country as an endpoint for recycled materials, with smaller cities particularly hard hit. In response, Thailand and India began accepting more recycling waste and making other adjustments including cut backs of recycling budgets, collections, and increased incineration. Standardization of recycling labeling laws remains a need.

In Latin America, rates of formal recycling remain at less than 4.5%, although more cities and countries are establishing programs (Moyer 2018). The urban informal sector tie to waste activities is fueled by regional poverty with connected problems including exposure to health and environmental threats, gangs, and child labor (UN Stat 2018). Mexico City, for example, initiated an effort to address economic challenges, with an initiative to trade electronic waste for food. While not achieving zero waste goals, in 2019, Buenos Aires reports high waste processing and recovery rates of 78%, driven largely through joint activities of government and twelve waste-picker cooperatives (Ortiz-Moya et al. 2019). Cities in other parts of the developing world such as Lagos in Africa grapple with two contrasting sides of the recycling dilemma – problematic environmental impacts of ewaste shipments on the one hand and positive employment opportunities on the other.

## Waste Collection and Transfer

After storage of waste, the next steps in management involve collection and transport. The scope of waste collection varies greatly in cities worldwide, with coverage estimated to range from 48% in lower income, up to 85% in those with middle income, and almost all city waste collected in affluent countries. However, two billion people globally were without regular collection in 2015, with informal settlements often bearing the brunt of the urban problem (UNEP 2017). Low levels of collection, particularly in developing countries, are due to a wide range of factors including challenges of providing service, access of collection vehicles in large or dense unplanned areas, inability to pay collection fees, inefficient management,

and collection infrastructure in the face of increased urbanization. Comparative review utilizing "criticality index" analysis found collection problems particularly problematic in the cities in low income countries across Africa (Louki and Rouached 2020).

Waste management collection can be provided directly by the municipality to the whole population or only specific segments and may be either door to door or only at specific collection points. Sometimes collection occurs through contracting out to single or multiple private entities, with public cooperation between municipalities providing service another alternative. Privatization takes place in Europe, the United States, East Asia, and the Pacific. Research on the most optimal form of collection suggests that city size, fiscal condition, service cost, and political factors all play a role in choice of an appropriate strategy with fiscal stress, high service costs, and more conservative governments factors influencing use of contracting out. Joint service delivery is more appropriate for smaller size cities with contracting out more cost efficient for larger cities and towns (Plata-Díaz et al. 2014). Geographic Information Systems can help optimize collection planning through analysis of factors including trips, distances, and collection times.

Collection and waste transfer may be centralized or take place in stages, starting with pick up at households by trucks, vans, or even carts or bikes (Beken et al. 2014). Movement may go from smaller to larger forms of transport to the final destination, with transfer stations or collection points providing interim locations. Transfer stations are often controversial with neighborhood complaints focusing on inequitable distribution and they are still not adequately distributed throughout many large cities. Recyclable materials are transported to sorting plants with output moved for reprocessing in another domestic or international location. Collection can drain resources, with costs 4% to 20% of budgets for cities in developed and developing countries (Kaza et al. 2018). Barriers to effective collection may involve route planning, road condition, vehicle sufficiency, maintenance, manpower, or scheduling.

Charges related to collection vary greatly across world regions. Some cities provide collection free of charge, or payments may be obtained from those receiving service. This may be mandatory or automated through utility bills, property, or general taxes or through purchase of official garbage tags or bags, sometimes with incentive charges for recycling. Payments can also go directly to collection companies or private contractors. Volume based systems include pay or save-as-you throw or dump, unit or variable pricing. Finances remain a challenge and many jurisdictions face barriers including limited resources, and prevalence of low income households that pay little or nothing for waste services. Local governments generally pay half the costs of solid waste management with help from national governments or the private sector often filling the gap (Kaza et al. 2018).

## Disposal and Treatment

Disposal sites which serve as final destinations for waste may be uncontrolled, controlled dumps or sanitary landfills with improvements including liners, leachate, gas collection and control, and regulated closure. Proliferation of open dumps poses serious problems for many cities, particularly in the developing world. These have no barriers between waste and soil, with environmental problems including leachate, fire, explosions, emissions of greenhouse gases, and persistent organic pollutants. Open dumps now handling 1/3 of the waste are appealing because they are viewed as the simplest, most convenient, least expensive, and technologically complex option for many localities (Saleh and Keller 2019). However, there are subsequent health impacts, particularly for informal sector waste pickers and communities near dumpsites who are most exposed. Disease transmission occurs through the rats, flies, mosquitoes, and other insects attracted to waste. Landfill gas from waste decomposition exacerbates greenhouse gases estimated at 60% methane ($CH_4$) and 40% carbon dioxide ($CO_2$) with other emissions through both transport and burning (Renner 2016; Jha et al. 2008). Methane capture is increasingly used for electricity generation.

Many cities in Africa, Asia, and Latin America are working towards improved sanitary

landfilling. In Africa only 10% goes to improved landfills while in Asia, landfills tend to be controlled, rather than tightly engineered, due to financial constraints. While movement towards improved design and better managed sanitary landfills with gas recovery is taking place, large cities like Beijing depended on landfills until 2010, when biotreatment, repurposing, waste-to-energy, and incineration accelerated. (Jha et al. 2008). Organic waste can be composted through aerobic treatment, used as manure or soil fertilizer, or treated through bio-methanogenesis or anaerobic treatment in reactors generating biogas which can be used for electricity or heat (Saleh and Keller 2019). In Latin America and the Caribbean, one third of waste is still dumped or left in open areas without proper management. Urban areas continue to have problems with space limitations for either disposal sites and new or improved landfills. Landfill closures for cities, particularly large megacities, cause problems in sourcing alternatives. Examples include Shanghai in 2017, New York City Fresh Kills in 2001, the Bordo Poniente landfill Mexico City in 2011, and Brasilia's Estrutural landfill in 2018, each posing complex closure and replacement challenges of some of the largest city landfills in the world (Hettiarachchi et al. 2018).

Incineration describes facilities built for combustion of waste, with newer waste-to-energy facilities, also called resource recovery, converting waste through steam generation to electricity or heat. These are popular in cities primarily in developed countries, with cities in Europe, the United States, Japan, and China expanding use after the 1960s. The 1300 nearly doubled between 2012 and 2020. Attractive features include significant reduction of waste mass and volume, greenhouse gas reduction such as methane and economic returns (Menikpura et al. 2016). Resource recovery facilities and incinerators are controversial because of health concerns, particularly impacts for adjacent populations from cancer and respiratory or reproductive impacts. There is also diversion from recycling. In recent years, improved abatement systems reduce pollutants although aging facilities still have problems with emissions including mercury, heavy metals, volatile organic compounds, or dioxins. Strict standard setting is a policy tool to reduce emissions. High operating and investment costs are disadvantages. Medical and hazardous waste are waste streams heavily reliant on incineration. Hazardous waste is governed by the Basil Convention which articulates Environmentally Sound Management (ESM) and disposal (UNEP 2017). Inadequate training, awareness, and integrated planning with other levels of government with respect to medical waste remains a problem in some municipalities, particularly in developing countries (Guerrero et al. 2013; Hasan and Rahman 2018). Composting and digestion of organic waste provides another disposal option.

## The Way Forward

Thus, it is clear that in coming decades, effective municipal waste management must increase, particularly in low and lower middle income cities, because of population growth trajectories. Cities in regions targeted for future urban growth, such as Latin America and the Caribbean, need particular focus to reduce existing management challenges. Environmentally sound, cost effective management must be paired with creative, visionary, pragmatic approaches linked to local realities. Improved planning is critical but involves rethinking a range of issues including overlapping authority and top down processes to increase inclusive, participatory engagement with key stakeholders. The aim is to increase not only buyin, but also innovation and resources brought to bear in all phases of the waste system. Advanced use of virtual technology provides opportunities to increase not only savings by cities but also more coordinated training and resources for municipal solid waste managers in a range of areas, including data collection, analysis, information sharing, and even regulation. Circular economies can be enhanced through role modeling and peer networking. Movement away from outmoded strategies such as open dumping necessitates not only full engagement but also resources, wise use of smart technologies, and regional as well as informal and private sector integration. Collections systems can be planned using tools such as geographic information

systems, sensors, global positioning systems, and fleet trackers. Planning must also be ongoing and involve methods of follow-up, clear lines of authority, and acknowledge power of the unexpected, including changing circumstances related to manpower disruptions due to health emergencies. Attention must be given to the full range of types of waste with special efforts focusing on methods to improve management of organic, medical, construction, and hazardous waste. Careful mapping should include roles and resources but also responsibilities of not just government but also civil society, private actors and international networks to ensure they enhance rather than impede waste systems.
